In 1984, investigations were started in the German Democratic Republic regarding the functions of the operative aircraft dispatcher. The considered functions do not represent a new development for the airport Berlin-Schoenefeld. However, requirements arise for the improvement and the qualification of the process-controlling system. These requirements are related to the introduction of more advanced and larger aircraft, the employment of new operational techniques, and an increasing utilization of automation. The structure of the current system for the control of dispatching operations is critically examined, and approaches for the elimination of certain problems are discussed. Attention is given to the fundamental technological concept, personnel and material aspects, the utilization of data transmission by radio, the transitional phase concerning the introduction of the new operative aircraft dispatching services, and the benefits which can be obtained as a result of the proposed changes. G.R.

**ASPECTS OF CURRENT INTEREST CONCERNING THE DEVELOPMENT OF WORLD AIR TRAFFIC. II [AKTUELLE ENTWICKLUNGSASPEKTE DES WELTLUFTVERKEHRS. II]**
J. GRENZDOERFER (Interflug Gesellschaft fuer Internationalen Flugverkehr mbH, Berlin, East Germany) Technisch-Oekonomische Information der zivilen Luftfahrt (ISSN 0232-5012), vol. 21, no. 5, 1985, p. 188-191. In German.

The origin and development of the Soviet airline Aeroflot are discussed, taking into account the great number of passengers using Aeroflot, the huge volume of air cargo, the use of aircraft to support people in remote areas of the Soviet Union, the employment of aircraft in operations related to agriculture and forestry, missions to provide medical aid, remote sensing studies, the utilization of aircraft in construction projects, and the maintenance of scientists conducting research in polar regions. Statistical data regarding the development of world air traffic in 1984, published by the ICAO, are examined, and the competitive situation with respect to current airliners produced in the U.S. and Europe is considered. The causes of aircraft accidents are also evaluated, giving attention to the development of special devices and procedures which will make it possible to avoid accidents and enhance safety. G.R.

**DFVLR, ANNUAL REPORT 1984 [DFVLR, JAHRESBERICHT 1984]**
Cologne, West Germany, Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, 1985, 107 p. In German. No individual items are abstracted in this volume.

The research fields considered include air traffic measurement, aircraft technology, turbo propulsion and turbomachinery, nonnuclear energy systems, satellite communication and localization, remote sensing of the earth, space systems, and advanced technologies and technology transfer. Attention is given to the Avionics Flight Evaluation System (AFES), the new adaptive test section for the high-speed wind tunnel at Goettingen, active control technology, the operative range of aircraft, titanium alloys in turbine engines, first operational results of the solar power pilot plant in Southern Spain, and satellite communication for mobile users. Other topics explored are related to the detection of forest disease by remote sensing methods, the results of 'Maus' experiments, and Titan, the deep diving simulator of the Institute for Aerospace Medicine. **NASA FLIGHT OPERATIONS REVIEW Final Report**
Aug. 1985 153 p Sponsored by NASA
(NASA-CR-176404; NAS 1.26:176404) Avail: Issuing Activity CSCL 01B

This report is the fourth of a series of independent assessments of the provisions taken by NASA to assure the safety of their aviation operations. The particular review covered by this report concerns aviation operations conducted at the Kennedy Space Center (KSC). These reviews and independent assessments were undertaken as part of an on-going effort to provide NASA management with a qualitative evaluation of the overall organizational structure, administrative policy, and management provisions which dictate the manner in which NASA's aviation operations are conducted. This review was conducted by a group of unbiased aviation experts, selected for their familiarity and experience with aviation flight research and development activity. Recommendations for improvements are provided in this report whenever a significant impact on the present level of safety assurance was judged to be feasible. B.W.

**STATIC AND DYNAMIC PITCH STABILITY OF A BLUNTED CONE WITH FORWARD FACING AERODYNAMIC SPIKE IN HYPERSONIC FLOW**
G. R. HUTT and R. A. EAST (Southampton, University, England) Aeronautical Journal (ISSN 0001-9240), vol. 89, Oct. 1985, p. 307-314. Research supported by the Ministry of Defence (Procurement Executive). refs

This paper presents experimental data highlighting the effects of a forward facing aerodynamic spike on the pitch stability of a blunted cone in hypersonic flow. Spike length and angle of attack variations on stability derivatives are described. Suitable application of the inviscid embedded Newtonian pitch stability prediction technique shows how the influence of spike aerodynamics may be successfully modeled. The paper extends the knowledge of aerodynamic spike flow effects, which have to date concentrated on aerodynamic drag reduction qualities at zero degrees angle of attack. Author

**ON THE EFFECTS OF BOUNDARY-LAYER TRANSITION ON A CYLINDRICAL AFTERBODY AT INCIDENCE IN LOW-SPEED FLOW**
D. I. A. POLL (Cranfield Institute of Technology, England) Aeronautical Journal (ISSN 0001-9240), vol. 89, Oct. 1985, p. 315-327. Research supported by the Ministry of Defence (Procurement Executive). refs

The experimentally observed changes in the location of boundary layer separation on the cylindrical afterbody of a tangent-ogive-cylinder, placed at incidence in a uniform flow, are related to the phenomenon of laminar-turbulent transition. Existing knowledge of the transition mechanisms which operate in general, three-dimensional, boundary layers, is described and simple prediction criteria are derived for this configuration. These criteria are compared with the currently available empirical methods for the prediction of critical Reynolds numbers for such flows. It is demonstrated that the methods which have been published to date are incomplete and the accompanying analyses are based upon superficial and erroneous physical arguments. The implications of boundary layer transition on the normal forces generated by a cylindrical afterbody are also discussed. Finally, the possibility of using transition fixing to establish 'high Reynolds number' separated flows in 'low Reynolds number' wind-tunnel facilities is briefly considered. Author

**CONFERENCE ON LOW REYNOLDS NUMBER AIRFOIL AERODYNAMICS, NOTRE DAME, IN, JUNE 16-18, 1985, PROCEEDINGS**

T. J. MUELLER, ED. (Notre Dame, University, IN) Conference sponsored by NASA, U.S. Navy, and University of Notre Dame. Notre Dame, IN, University of Notre Dame, 1985, 354 p. For individual items see A86-16302 to A86-16324.
(Contract NASA ORDER L-77177-B; N00014-85-G-0123)

Topics of interest in the design, flow modeling and visualization, and turbulence and flow separation effects for low Reynolds number (Re) airfoils are discussed. Design methods are presented for Re from 50,000-500,000, including a viscous-inviscid coupling method and by using a constrained pitching moment. The effects of pressure gradients, unsteady viscous aerodynamics and separation bubbles are investigated, with particular note made of factors which most influence the size and location of separation bubbles and control their effects. Attention is also given to experimentation with low Re airfoils and to numerical models of symmetry breaking and lift hysteresis from separation. Both steady and unsteady flow experiments are reviewed, with the trials having been held in wind tunnels and the free atmosphere. The topics discussed are of interest to designers of RPVs, high altitude aircraft, sailplanes, ultralights and wind turbines. M.S.K.

**AIRFOIL DESIGN FOR REYNOLDS NUMBERS BETWEEN 50,000 AND 500,000**

R. EPPLER (Stuttgart, Universitaet, West Germany) and D. M. SOMERS (NASA, Langley Research Center, Hampton, VA) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 1-14. refs

The design of airfoils for flows with Re of 50,000-500,000 requires consideration of laminar separation bubbles. A design approach is discussed which specifies the angle of attack at which the potential flow velocity is to be constant at each segment of the airfoil. The velocity gradient is controlled by introducing a pressure recovery function at the trailing edge. Boundary layer stability decreases with rising Re, although an upper Re value can be identified, below which the boundary layer will be stable. Adverse pressure gradients are associated with the shape parameter of the velocity profile, whose rise in value decreases stability. Transition displays similar relationships to the shape parameter. The most frequent feature of separation is the appearance of a separation bubble. M.S.K.

**A86-16303#**

**LOW REYNOLDS NUMBER AIRFOIL DESIGN**

M. D. MAUGHMER (Pennsylvania State University, University Park) and M. S. SELIG (Princeton University, NJ) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 15-26. refs

Attempts at developing techniques for characterizing velocity profile effects on a low Re airfoil are explored. The low Re of the flow can cause uncontrollable factors in the free stream, e.g., turbulence, to cause separation beyond the control of the designer. Experimental data have shown that hysteresis effects occur in lift and drag at Re under 200,000 in stall conditions. The separation effects which cause the hysteresis can be avoided by the use of turbulators which induce velocity distributions that do not allow separation bubbles to form. Short and long separation bubbles are also affected by the leading edge and upper surface shapes of the airfoil. Airfoil shapes generated with the Eppler and Somers code and with finite trailing edge pressure gradients are discussed. The former was for sailplane competition. M.S.K.

**AIRFOIL DESIGN AT LOW REYNOLDS NUMBER WITH CONSTRAINED PITCHING MOMENT**

R. H. LIEBECK and P. P. CAMACHO (Douglas Aircraft Co., Long Beach, CA) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 27-51.

The design principles applied and the wind tunnel data gathered for the performance of two airfoils intended for use in low Re regimes are discussed. The lift coefficient range desired was 0.5-1.5 and the maximum lift coefficient was to be 1.8. One airfoil, the LNV109A, was to have a pitching moment constrained to -0.05 and be thicker and have a larger negative pitching moment than the other airfoil, the LA203A. The LNV109A was designed, following tests with the Wortman FX63-137 airfoil, to incorporate a Stratford recovery distribution and mild aft-loading. The airfoils were instrumented with numerous surface pressure taps and a wake rake and tested up to 195 mph at four Re values from 250,000-650,000. Some trials were run with transition strips attached to the airfoils' upper surfaces. The LA203A did not have a transition problem, although the lift coefficient was 1.7 instead of the desired 1.8. The LNV109A experienced a drag penalty, attributable to the presence of a separation bubble, at the lower Re. M.S.K.

**A86-16305#**

**A VISCOUS-INVISCID COUPLING METHOD FOR THE DESIGN OF LOW REYNOLDS NUMBER AIRFOIL SECTIONS**

A. A. HASSAN (Arizona State University, Tempe) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 53-63. refs

An inviscid-viscous hybrid model is presented for designing low Re airfoils. The inverse design algorithm (IDA) combines a direct computational approach for selecting the aerodynamics of an airfoil and an inverse approach for the expected pressure distributions (PD). IDA includes a conformal transformation of the semi-infinite, two-sheeted Riemann hodograph free-surface representation of the airfoil into a unit circle. A target pressure distribution serves as input at selected Mach numbers. The full stream function equation is solved with second-order accurate direct solver. A Neumann boundary condition satisfies the tangency condition for the unit circle conformal mapping, which is solved using the FLO6 finite difference algorithm. Corrections are defined for boundary layer effects such as the displacement thickness, which is computed at every streamwise computational node. The model is fully automated but requires further work to reduce the required computational effort and to handle separation conditions. M.S.K.

**A86-16306#**

**EFFECT OF PRESSURE GRADIENTS ON THE GROWTH OF SUBHARMONIC DISTURBANCES IN BOUNDARY LAYERS**

T. HERBERT and F. P. BERTOLOTTI (Virginia Polytechnic Institute and State University, Blacksburg) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 65-76. refs
(Contract N0014-84-K-0093)

Spatial growth is incorporated in a model of secondary instability occurring around low Re airfoils. Governing equations are defined for the periodic basic flow over a semi-infinite plate at a given angle of attack. Expressions are defined for the boundary layer stream function, the Falkner-Skan equation and the Tollmein-Schlichting waves which appear as primary disturbances. A secondary disturbance is superimposed on the basic flow model and entered into the Navier-Stokes equations. Modifications result in a series of linear differential equations from which the subharmonic mode can be extracted, reformed into a Fourier series, and combined to model the secondary disturbances. The model is extended to describe temporal and spatial growth of both primary and secondary modes. A stability analysis for an FX-63-137 airfoil, when compared with experimental data, gives accurate lift and drag values but fails to generate acceptable velocity profiles. Techniques which will increase the accuracy of the computations and permit descriptions of the self-sustained growth of secondary modes are discussed. M.S.K.

**COMPUTATIONAL AND THEORETICAL STUDIES OF UNSTEADY VISCOUS AERODYNAMICS**

J. C. WU (Georgia Institute of Technology, Atlanta) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 77-88. refs
(Contract AF-AFOSR-82-0108; DAAG29-82-K-0094)

A coordinated theoretical and computational approach for analyzing unsteady aerodynamics of viscous fluids is reviewed. This approach permits aerodynamic computations to be confined to the viscous region of the flow and aerodynamic analyses to be carried out with a knowledge of the viscous region of the flow only. The approach also permits the individual flow zones contribution to unsteady aerodynamic load to be identivied and their relative importance evaluated. This approach is based on viscous flow equations. For aerodynamic flows in the absence of appreciable recirculating regions, the approach produces classical theories of aerodynamics and panel-vortex lattice computation procedures. The approach is ideally-suited for aerodynamic analyses of unsteady flows containing massive separated regions. Author

**RESEARCH ON LAMINAR SEPARATION BUBBLES AT DELFT UNIVERSITY OF TECHNOLOGY IN RELATION TO LOW REYNOLDS NUMBER AIRFOIL AERODYNAMICS**

J. L. VAN INGEN and L. M. M. BOERMANS (Delft, Technische Hogeschool, Netherlands) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 89-124. DFVLR-supported research. refs

An overview is presented of research at Delft University of Technology on laminar separation bubbles in relation to low Reynolds number airfoil aerodynamics. Results of flow visualization studies are used to define an empirical relation for the angle at which the separation streamline leaves the wall. The e(n) transition prediction method is extended to separated flows. It is shown that a simple bursting criterion is provided by Stratford's limiting pressure distribution for a zero skin friction turbulent boundary layer. A universal description of the laminar part of the bubble is proposed, resulting in a simple bubble prediction method. The effect of tripping devices for decreasing the adverse effect of the bubble on drag is discussed. Finally, some results of low Reynolds number airfoil tests are reported. Author

**AN ANALYSIS OF A SEPARATION BUBBLE TRANSITION CRITERION AT LOW REYNOLDS NUMBERS**

G. S. SCHMIDT, M. M. OMEARA, and T. J. MUELLER (Notre Dame, University, IN) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 125-136. Research sponsored by the University of Notre Dame. refs
(Contract NSG-1419)

Factors which influence the criterion governing the length of the laminar region of a separation bubble on an airfoil at low Re were investigated. The criterion is the onset of separation when a critical Re value is surpassed. Wind tunnel data were gathered for the flow around a NACA 66(3)-018 airfoil at Re from 50,000-200,000. The data were taken with either hot-wire anemometers or pressure taps. The value of the critical Re was influenced by the chord Re, the angle of attack and the level of turbulence in the free stream. However, the turbulence levels examined, up to 0.184 percent, did not greatly affect the critical Re. Further characterizations of the effects of the three factors on the critical Re are necessary before the important features of separation bubbles can be identified with an acceptable level of certainty. M.S.K.

**A86-16310#**

**THEORETICAL AND EXPERIMENTAL STUDY OF LOW REYNOLDS NUMBER TRANSITIONAL SEPARATION BUBBLES**

C. GLEYZES, J. COUSTEIX, and J. L. BONNET (ONERA, Centre d'Etudes et de Recherches de Toulouse, France) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 137-152. refs

A review of selected work on transitional separation bubbles is presented. An experimental study in two-dimensional flows provided information about the effects of separation bubbles on the flow on the upper surface of an airfoil at low Reynolds number. A detailed study of the transition mechanisms was also performed, and boundary layer surveys permitted validation of the calculation method. The method is based on an inverse boundary layer calculation associated with a local viscous-inviscid interaction. Transition being a critical problem, an adequate criterion was developed. Extension of the model to three-dimensional infinite swept wing configuration is in progress. Author

**A86-16312*#** Virginia Univ., Charlottesville.

**SEPARATION BUBBLE BEHAVIOR FOR A NACA 23009 AIRFOIL**

S. S. FISHER (Virginia, University, Charlottesville), J. D. ABBITT, and G. W. OLEARY IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Da[illegible] University of Notre Dame, 1985, p. 169-181. NASA-suppo[illegible]search. refs

Results are reported of experiments with smoke-wire flow visualization applied to characterizing the conditions conducive to formation of a separation bubble on an airfoil in low Re flow. An airfoil was used which spanned the test channel of the wind tunnel designed for low turbulence and noise. A wire coated with mineral oil was stretched across the channel upstream of the airfoil and heated. The smoke it gave off was flash-illuminated and photographed with ASA 3000 film. Extending the airfoil over the entire section yielded photographs that gave an essentially two-dimensional perspective. Angles of attack from 0-10 deg were investigated at Re of 33,000, 66,000, 100,000 and 133,000. Sample photographs illustrate the usefulness of the technique and apparatus in the flow regimes examined, particularly when used in conjunction with pressure tap data from the airfoil surface. M.S.K.

**ASPECT RATIO EFFECTS ON THE AERODYNAMICS OF A WORTMANN AIRFOIL AT LOW REYNOLDS NUMBER**

J. F. MARCHMAN, III, A. A. ABTAHI, and V. SUMANTRAN (Virginia Polytechnic Institute and State University, Blacksburg) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 183-193. Research supported by Virginia Polytechnic Institute and State University. refs
(Contract N00014-84-K-0093)

Wind tunnel tests were conducted on a series of wings employing the Wortmann FX-63-137-ESM airfoil to determine the influence of wing aspect ratio on the aerodynamic behavior of that section at low Reynolds numbers. Tests were performed in the six by six foot test section of the Virginia Tech Stability Wind Tunnel at a free stream turbulence level of two one-hundredths of a percent. Tests were conducted at Reynolds numbers between 50,000 and 500,000 with model wing aspect ratios of 4, 6, 8 and 10. Test results showed that aspect ratio influences the size of the low Reynolds number stall hysteresis loop and the range of Reynolds number over which the hysteresis loop exists as well as having the usual effects on the slope of the lift curve and the magnitude of the maximum lift coefficient. Flow visualization tests showed no three dimensional flow patterns at low Reynolds numbers other than the expected wing tip flows. Author

**A86-16314#**

### PERFORMANCE OF FINITE WINGS AT LOW REYNOLDS NUMBERS

W. G. BASTEDO, JR. and T. J. MUELLER (Notre Dame, University, IN) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 195-205. refs
(Contract N00014-83-K-0239)

The performance of three rectangular wings of aspect ratios equal to 5.4, 4.0 and 3.0 were studied at chord Reynolds numbers ranging from 80,000 to 200,000. Each wing utilized the Wortmann FX 63-137 airfoil section, and two-dimensional data for this profile was also obtained. Examination of the data revealed that increasing chord Reynolds number increased performance of the wings and the airfoil, while reducing aspect ratio decreased the lift curve slope and overall performance. This data supported the applicability of simple techniques for predicting wing performance from airfoil data. Author

**A86-16315#**

### AN ENVIRONMENTAL AERODYNAMIC TEST SYSTEM FOR LOW-REYNOLDS-NUMBER APPLICATIONS

H.-T. LIU, E. W. GELLER, and M. COOPER (Flow Industries, Inc., Research and Technology Div., Kent, WA) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 207-218. refs
(Contract N00014-83-C-0764)

A truck-mounted environmental aerodynamic test system (EATS) for testing full-scale low-Re wings or flight-ready RPVs is described. The airfoil or RPV is affixed to a boom to extend it into the flow above the truck cab. The wing or RPV is instrumented with a six-component balance for force and moment data. The truck bed carries a mini-meteorological station, an accelerometer, a pitch/yaw gear, a portable generator, a signal conditioner and a microcomputer. The data are gathered in Re from 150,000-1,000,000 in actual environmental conditions, e.g., gusts, turbulence and rain. Based on a system for glider testing, EATS can be used for examining the two- and three-dimensional aerodynamics of high altitude and low speed aircraft. M.S.K.

**A86-16316#**

### SYMMETRY BREAKING AND LIFT HYSTERESIS ARISING FROM MASSIVE LAMINAR SEPARATION - A STUDY OF MULTIPLE STEADY-STATE SOLUTIONS

H. K. CHENG (Southern California, University, Los Angeles, CA) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 219-233. refs
(Contract N00014-82-K-0315)

An approach is described to studying the inviscid-viscous interaction of the body-scale flow involving massive laminar separation, as a modified airfoil problem through a triple-deck and other compatible structures modelling steady-state Navier-Stokes solutions at high Reynolds number. A recent development of this approach applied to wing sections is summarized. The theory admits open and closed wakes, as well as laminar reattachment on the wing. Steady-state solutions pertaining to open-wake models are studied in detail. Examples of solution bifurcation signifying symmetry breaking, hysteresis and other lift anomalies of the low Reynolds number flows are discussed. D.H.

**A86-16317#**

### COMPUTATIONAL STUDY OF FLOW OVER MILEY AND WORTMANN AIRFOILS

A. P. KOTHARI and J. D. ANDERSON, JR. (Maryland, University, College Park) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 235-254. refs
(Contract N00014-81-K-2037; N00014-84-K-0161)

A computational tool has been developed that calculates viscous 2-D flowfields about airfoils of interest. The program uses a finite difference implicit technique to solve the compressible Navier-Stokes equations. Both purely laminar and transitional turbulent flows are treated. The technique is time-dependent and hence makes it possible to treat the transient flowfields. The technique, which does not require the use of a supercomputer, is a modification of MacCormack's implicit technique to handle the curvilinear, boundary-fitted coordinate system which must be wrapped around the airfoil. D.H.

**A86-16318#**

### EXPERIMENTS ON UNSTEADY FLOWS ABOUT WING SECTIONS

E. KRAUSE, G. EHRHARDT, and B. SCHWEITZER (Aachen, Rheinisch-Westfaelische Technische Hochschule, West Germany) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 255-267.

Vortex shedding on wing sections due to time-dependent variation of the free stream velocity is being studied experimentally. The aim of the investigation is to obtain information about the details of the flow structure, particularly in the vicinity of the trailing edge, to determine shedding frequencies, range of stability of the vortex street, and extent of the separated region. Measurements will be made of the time-dependent surface pressure distribution as a function of freestream Strouhal number and Reynolds number for accelerated and decelerated flows. Results so far have come from a water table and a water tunnel, but experiments are being set up in an Eiffel tunnel. D.H.

**A86-16319#**

### STREAMWISE AND SPANWISE VORTICAL PATTERNS VISUALIZED OVER AIRFOILS IN UNSTEADY FLOW

F. FINAISH, P. FREYMUTH, and W. BANK (Colorado, University, Boulder) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 269-279. refs
(Contract AF-AFOSR-81-0027)

The relationship between the streamwise and the spanwise developments of vortical patterns over airfoils and the transition to turbulence of those patterns in unsteady flow starting from rest are the main subjects of this paper. To study the relationship between the two modes of visualization and to investigate the effect of the three-dimensional disturbances in the spanwise mode, a complementary illustration of the two modes of visualization for different Reynolds numbers and angles of attack is presented by means of selected photographic frames and sequences. Spanwise visualization of the flow field over airfoils in unsteady flow reveals the development of three-dimensional disturbances, which provide more information about the transitional stages and breakdown into turbulence. Author

### PRELIMINARY EXPERIMENTS IN UNSTEADY FLOW ON AIRFOILS AT LOW REYNOLDS NUMBERS

M. BRENDEL and T. J. MUELLER (Notre Dame, University, IN) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 281-292.
(Contract N00014-83-K-0239)

A program to study the aerodynamic characteristics of airfoils in unsteady flows at low Reynolds numbers has recently been initiated. An experimental facility designed to produce temporal variations in the streamwise velocity of the subsonic wind tunnel is presented. The device features a programmable input, thus allowing many variations of periodic velocity waveforms. A method to suppress higher harmonics present in sinusoidal velocity waveforms is discussed. A preliminary experiment to determine the feasibility of extending steady flow pressure measurement techniques is also presented. The data are preliminary since an independent measurement technique has not been employed to validate results. The value of unsteady pressure distributions to reveal aerodynamic parameters and boundary layer characteristics warrants further work into understanding and improving unsteady pressure measurements. Author

A. F. HUBER, II and T. J. MUELLER (Notre Dame, University, IN) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 307-322. refs

(Contract N00014-83-K-0239)

An experimental investigation was conducted on the performance and boundary layer characteristics of the Wortmann FX 63-137 airfoil with and without trip wire roughness. Data were obtained through use of a three-component strain gage force balance and static pressure measurement equipment at a test Reynolds number of R(c) = 100,000. Emphasis was placed on determining the effect of trip wire placement and size on such performance parameters as (C sub l/C sub d)max and (C sub l exp 3/2/C sub d)max. Prediction of transition location by the criterion due to Tani (1956) and Gibbings (1959) was found to have limited application. In most cases airfoil performance was degraded, but in some instances minimum drag was reduced and maximum lift to drag ratio increased. Author

**ACOUSTIC AND TURBULENCE INFLUENCE ON LOW-REYNOLDS NUMBER WING PRESSURE DISTRIBUTIONS**

V. SUMANTRAN, Z. SUN, and J. F. MARCHMAN, III (Virginia Polytechnic Institute and State University, Blacksburg) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 323-334. Research supported by the Virginia Polytechnic Institute and State University. refs

(Contract N00014-84-K-0093)

Wind-tunnel tests were conducted in the Virginia Tech 6 ft x 6 ft Stability Wind-Tunnel to determine the influence of free-stream turbulence and acoustic disturbances on low Reynolds number wing aerodynamics. The wing model was based on a FX-63-137-ESM airfoil section. Strain gauge measurements, pressure distribution, and flow visualization studies were conducted in the range of Reynolds numbers from 70,000 to 300,000. Starting with the very clean flow inherent in the wind-tunnel, free-stream turbulence and acoustic disturbance levels in the test-section were increased independently. A distinct alteration of the wing's performance was observed particularly with regard to the stall hysteresis loop which may even be eliminated at very low Reynolds number-high disturbance level conditions. This study also shows clearly the behavior of the laminar separation bubble which contracts and moves forward with increasing angle of attack and determines the manner in which the airfoil stalls. **PROPELLER SLIPSTREAM/WING BOUNDARY LAYER EFFECTS AT LOW REYNOLDS NUMBERS**

S. J. MILEY, R. M. HOWARD (Texas A&M University, College Station), and B. J. HOLMES (NASA, Langley Research Center, Hampton, VA) IN: Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings . Notre Dame, IN, University of Notre Dame, 1985, p. 335-349. refs

(Contract NAG1-344)

The effects of propeller slipstream on the wing laminar boundary are being investigated. Hot-wire velocity sensor measurements have been performed in flight and in a wind tunnel. It is shown that the boundary layer cycles between a laminar state and a turbulent state at the propeller blade passage rate. The cyclic length of the turbulent state increases with decreasing laminar stability. Analyses of the time varying velocity profiles show the turbulent state to lie in a transition region between fully laminar and fully turbulent. The observed cyclic boundary layer has characteristics similar to relaminarizing flow and laminar flow with external turbulence. Author

**THE APPLICATION OF LASER ANEMOMETRY TO THE STUDY OF TRANSONIC SHOCK BOUNDARY-LAYER INTERACTIONS**

H. J. SCHAEFER (Saint-Louis, Institut Franco-Allemand de Recherches, France) IN: International Symposium on Applications of Laser Anemometry to Fluid Mechanics, 2nd, Lisbon, Portugal, July 2-5, 1984, Proceedings . Lisbon, Instituto Superior Tecnico, 1985, p. 1.3 (4 p.). refs

A laser Doppler anemometer operating in forward scatter was used to study the transonic flow above a supercritical airfoil. The measurements were concentrated upon the region of interaction between shock wave and boundary layer. The experimental results, as expressed by the constant Mach number contours, are compared with the corresponding boundary-layer pressure measurements as well as with a numerical simulation of the flow field. **L.D.A. MEASUREMENTS IN THE TURBULENT NEAR-WAKE OF BLUNT BODIES**

C. BERNER and A. KOENEKE (Saint-Louis, Institut Franco-Allemand de Recherches, France) IN: International Symposium on Applications of Laser Anemometry to Fluid Mechanics, 2nd, Lisbon, Portugal, July 2-5, 1984, Proceedings . Lisbon, Instituto Superior Tecnico, 1985, p. 7.1 (6 p.). refs

Turbulence fluctuations have been measured in the immediate near-wake behind three blunt axisymmetric afterbodies, using an ISL blow-down type of [illegible] jet that allows Mach number variations in the entire subsonic range (0.22-0.93 M). A two-color, three-beam LDA system equipped with an argon-ion laser as a light source was employed. A 40 MHz Bragg cell was used for measurements of velocity component distributions and the corresponding fluctuations. It was found that stagnation point location is influenced by model geometry and is a function of Mach number, confirming existing theory (Delery, 1983). At constant Mach number, increases of the boattail angle and length led to decreases in size of the recirculating region. In the recirculating region, maximum velocity on the near-wake centerline was equal to about 35 percent of the free-stream velocity regardless of the Mach number. Turbulence quantities were higher for smaller Mach numbers and lower when the recirculation region was reduced. I.S.

### EXPERIMENTAL ANALYSIS OF TIP VORTEX BY LASER DOPPLER ANEMOMETRY

L. ACCARDO (Centro Esperienze Idrodinamiche Marina Militare, Rome, Italy), A. CENEDESE, and F. CIOFFI (Roma, Universita, Rome, Italy) IN: International Symposium on Applications of Laser Anemometry to Fluid Mechanics, 2nd, Lisbon, Portugal, July 2-5, 1984, Proceedings . Lisbon, Instituto Superior Tecnico, 1985, p. 12.4 (6 p.). refs

The aerodynamic performances of aircraft wings, helicopter rotors, marine propellers, and turbomachines are related to the presence of turbulent boundary layers and vortex sheet formation. The mutual interaction between boundary layers makes three-dimensional the phenomenon. This aspect is particularly evident at the wing/body junction and at the extremity of the wings or blades where tip vortices are formed. By means of laser Doppler anemometry, the velocity field is experimentally analyzed close to the tip in the near wake generated by a symmetrical wing with a rectangular plant. The analysis of experimental results shows that there exists a strong axial current in the core of the tip vortex. A velocity logaritmic trend is formed in the zone where there is interaction between the irrotational flow and the core vortex. Author

### MEAN FLOW PROPERTIES MEASURED AROUND AN AEROFOIL CLOSE TO ITS MAXIMUM LIFT

R. C. HASTINGS, K. G. MORETON, and R. CLARK (Royal Aircraft Establishment, Bedford, England) IN: International Symposium on Applications of Laser Anemometry to Fluid Mechanics, 2nd, Lisbon, Portugal, July 2-5, 1984, Proceedings . Lisbon, Instituto Superior Tecnico, 1985, p. 14.1 (6 p.). refs

A description is given of a low-speed wind tunnel experiment to define the flow field around an aerofoil on whose upper surfaces separation is well forward of the trailing edge. Most of the data were obtained with a two-component, photon-correlation, laser Doppler anemometer. Integral properties of the aerofoil boundary layer and wake are presented. Pressure distributions on the aerofoil and on the wind tunnel roof and floor are also given. Author

### A METHOD FOR MEASURING PRESSURE DISTRIBUTION BY MEANS OF INDICATING COATINGS [METODIKA IZMERENIIA RASPREDELENIIA DAVLENIIA S POMOSHCH'IU INDIKATORNYKH POKRYTII]

M. M. ARDASHEVA, L. B. NEVSKII, and G. E. PERVUSHIN PMTF - Zhurnal Prikladnoi Mekhaniki i Tekhnicheskoi Fiziki (ISSN 0044-4626), July-Aug. 1985, p. 24-30. In Russian. refs

A method is presented whereby pressure distribution is measured by using indicating coatings of organic luminophors whose luminescence is quenched by oxygen molecules. The existing indicating coatings are sensitive to air pressure in the range 1000-100000 Pa; the sensitivity depends on the pressure range and is equal to 600 per Pa in the range 3000-10000 Pa. Results of pressure distribution determinations are presented for a sphere, the plane surface of a half-cone, and a plane plate with a superstructure. V.L.

### INVESTIGATIONS OF TRANSONIC LUDWIEG TUBES. III - EFFECTS OF PLENUM EXHAUST SYSTEM ON STARTING PROCESS OF TUNNEL TEST SECTION

K. KAGE, M. NAGATAKE (Oita University, Japan), K. MATSUO, and S. KAWAGOE (Kyushu University, Fukuoka, Japan) JSME, Bulletin (ISSN 0021-3764), vol. 28, Sept. 1985, p. 1868-1873.

The starting process in a transonic Ludwieg tube with a downstream valve was investigated experimentally by varying the timing of opening the main and the exhaust valves and varying the location of the orifice. A diagram for different opening times is presented. The choking time at the nozzle throat is found to be independent of differences in the timing of opening when the main valve opens first, but increases in proportion to the difference in timing when the exhaust valve opens first. The choking time at the orifice shows the opposite tendency. The starting time is minimum when the main and exhaust valves start to open simultaneously, and increases as the timing difference increases. When the orifice is downstream of the exhaust valve, the starting time is shorter than when the orifice is upstream of the valve. C.D.

### MATHEMATICAL SOLUTION FOR UNSTEADY SUBSONIC FLOW PAST A THIN PROFILE IN A CHANNEL [MATEMATICKE RESENI NESTACIONARNIHO SUBSONICKEHO OBTEKANI TENKEHO PROFILU V KANALU]

K. KOZEL and M. VAVRINCOVA Zpravodaj VZLU (ISSN 0044-5355), no. 1, 1985, p. 7-15. In Czech. refs

Consideration is given to unsteady subsonic flow past a thin profile in a channel formed by parallel walls, where the unsteady conditions are caused by periodic oscillations of the profile as well as by time variations of the inlet Mach number. The fundamental equation is derived; the appropriate differential and difference problems are formulated; and a numerical-solution method is presented. A numerical solution is obtained for a periodically oscillating profile with small oscillations at a constant freestream Mach number. Several cases of time variations of inlet flow are also considered. B.J.

### MODEL FOR ANALYTICALLY DESCRIBING EDGE VORTICES [EIN MODELL ZUR ANALYTISCHEN BESCHREIBUNG VON RANDWIRBELN]

R. STAUFENBIEL (Aachen, Rheinisch-Westfaelische Technische Hochschule, West Germany) Zeitschrift fuer Flugwissenschaften und Weltraumforschung (ISSN 0342-068X), vol. 9, Sept.-Oct. 1985, p. 283-293. In German. refs

A modification of the Lamb-Olseen model is used to derive an analytical vortex model with enough free parameters to satisfy the conservation laws. It is shown that simulation results obtained with the single vortex method can be used to determine the free model parameters. The model exhibits good agreement with experimental data, and can describe the rolling up of vortex sheets with substantially arbitrary circulation distribution. Since the rolling up occurs in a few seconds and the aging process sets in after 30 to 50 seconds, numerous vortex effects can be ascertained using this model, using only moderate computer time. C.D.

### TURBULENT-BOUNDARY-LAYER DEVELOPMENT IN AN ADVERSE PRESSURE GRADIENT AFTER AN INTERACTION WITH A NORMAL SHOCK WAVE

W. H. SCHOFIELD (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 154, May 1985, p. 43-62. refs

An experimental study has been made of the development of a turbulent boundary layer in an adverse pressure gradient after an interaction with a normal shock wave that was strong enough to separate the boundary layer locally. The pressure gradient applied to the layer was additional to the pressure gradients induced by the shock wave. Measurements were taken for several hundreds of layer thicknesses downstream of the interaction. It is shown that the adverse pressure gradient impressed on the flow downstream of the shock has a major effect on the structure of the interaction region and the growth of the layer through it. Consequently, existing results for interactions without a post-shock pressure gradient should not be used as a model for predicting practical flows, which typically have strong pressure gradients applied downstream of the shock wave. ### AN EXPERIMENTAL STUDY OF GEOMETRICAL EFFECTS ON THE DRAG AND FLOW FIELD OF TWO BLUFF BODIES SEPARATED BY A GAP

K. KOENIG and A. ROSHKO (California Institute of Technology, Pasadena) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 156, July 1985, p. 167-204. refs
(Contract NSF ENG-75-03694; NSF ENG-77-23541)

This paper describes an experimental investigation of the shielding effects of various disks placed coaxially upstream of an axisymmetric, flat-faced cylinder. Remarkable decrease of the drag of such a system was observed for certain combinations of the basic geometric parameters, namely the diameter and gap ratios. For such optimum shielding the stream surface which separates from the disk reattaches smoothly onto the front edge of the cylinder, in what is close to a 'free-streamline' flow; alternatively, the flow may be viewed as a cavity flow. For the optimum as well as other geometries, flow pictures, pressure distributions and some LDV measurements were also obtained. From these, several flow regimes depending on the gap/diameter parameters were identified. Variations on the axisymmetric disk-cylinder configuration included a hemispherical frontbody, rounding of the front edge of the cylinder and a change from circular to square cross-section. Author

### MEAN-FLOW MEASUREMENTS IN A SUPERSONIC THREE-DIMENSIONAL TURBULENT BOUNDARY LAYER

A. DEMETRIADES and G. MCCULLOUGH (Montana State University, Bozeman) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 156, July 1985, p. 401-418. refs
(Contract NAG2-37)

Measurements are presented of the mean flow in a supersonic turbulent boundary layer subjected to a constant weak transverse pressure gradient. The temperature and longitudinal velocity and the axial shear stress were only slightly affected by the three-dimensionality but a clearly defined crossflow component appeared, in the manner suggested by theory and confirmed in earlier experiments. The flow deflection angle and transverse-velocity component achieved a self-preserving form so long as the transverse-pressure gradient remained constant, and both achieved a maximum at the sublayer edge; the deflection angle seemed to decrease again between the latter and the surface. An empirical relation was found between the pressure-gradient strength and the maximum in the crossflow, and the dependence of the latter on distance from the surface was used to test analytical crossflow predictions. The data are in general agreement with Van Den Berg's law of the wall. The data also support the so-called parabolic law following a relaxation distance, especially if inviscid gradients are accounted for, and if the normal coordinate is contracted by the compressibility transformation. Author

### VORTICES INCIDENT UPON A LEADING EDGE - INSTANTANEOUS PRESSURE FIELDS

R. KAYKAYOGLU and D. ROCKWELL (Lehigh University, Bethlehem, PA) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 156, July 1985, p. 439-461. Research supported by the Stiftung Volkswagenwerk, NSF and Navy. refs

The interaction of a periodic row of vortices with an edge involves a splitting of the incident vorticity field into regions that pass above and below the edge. Major elements of this process are distortion/severing of the incident (primary) vortex, secondary vortex shedding from the tip of the edge, and a 'sweeping' of flow about the tip from the top to the bottom surface. Simultaneous flow visualization and surface pressure measurement furnish a link between these vortex edge interaction mechanisms and the instantaneous pressure fields on the edge. With respect to theoretical simulation of the leading edge pressure field, experimental observations suggest that inviscid modeling should not incorporate a leading edge Kutta condition; a singularity at the tip would be adequately representative. O.C.

### TRANSONIC ROTOR FLOW-MEASUREMENT TECHNIQUE USING HOLOGRAPHIC INTERFEROMETRY

J. K. KITTLESON and Y. H. YU (U.S. Army, Aeroflightdynamics Directorate, Moffett Field, CA) American Helicopter Society, Journal (ISSN 0002-8711), vol. 30, Oct. 1985, p. 3-10. refs

Holographic interferometry is used to record interferograms of the flow near a hovering transonic rotor blade. A pulsed ruby laser recorded 40 interferograms with a 2-ft-diam view field near the model rotor-blade tip operating at a tip Mach number of 0.90. This paper presents the experimental procedure and example interferograms recorded in the rotor's tip-path-plane. In addition, a method currently being pursued to obtain quantitative flow information using computer-assisted tomography (CAT) with the holographic interferogram data, is outlined. Author

### STRUCTURE OF A SUPERSONIC TURBULENT BOUNDARY LAYER DURING ITS INTERACTION WITH A SHOCK WAVE [STRUKTURA SVERKHZVUKOVOGO TURBULENTNOGO POGRANICHNOGO SLOIA PRI EGO VZAIMODEISTVII SO SKACHKOM UPLOTNENIIA]

M. A. GOLDFELD Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), Sept.-Oct. 1985, p. 75-82. In Russian. refs

The interaction of a turbulent boundary layer with a shock was studied in a supersonic wind tunnel in order to clarify questions connected with the increasing fill coefficient of the velocity profiles. Data on the development, structure, and asymptotic behavior of the boundary layer beyond the interaction region are obtained in axisymmetric flow for Mach numbers of 2-4 and flow rotation angles of 10-25 deg, with particular attention given to the occurrence of separated flow. The data confirm the increase in the fill coefficient beyond the shock as well as a significant increase in the surface friction. B.J.

**A THEORETICAL BASIS FOR EXTENDING SURFACE-PANELING METHODS TO TRANSONIC FLOW**

L. L. ERICKSON and S. M. STRANDE (NASA, Ames Research Center, Moffett Field, CA) AIAA Journal (ISSN 0001-1452), vol. 23, Dec. 1985, p. 1860-1867. refs

The surface integral terms in Green's third identity are often used to solve the Prandtl-Glauert (linear potential-flow) equation with panel methods. This can be done, as in the PAN AIR code, for either subsonic or supersonic flow about complete aircraft. The extension to transonic flow is suggested by the volume integral terms of Green's third identity. The mathematical basis for this extension, without the use of body-fitted grids, is presented. Supercritical transonic results computed from a two-dimensional transonic PAN AIR research code demonstrate the method. Author

**FREESTREAM TURBULENCE EFFECTS ON WAKE PROPERTIES OF A FLAT PLATE AT AN INCIDENCE**

S. PAL (New York City, Dept. of Environmental Protection, NY) AIAA Journal (ISSN 0001-1452), vol. 23, Dec. 1985, p. 1868-1871. refs

The effect of freestream turbulence on the characteristics of a turbulent wake developed from the trailing edge of a flat plate at angles of attack of -3, 0, and 6 deg is discussed. Correlations based on analytical and experimental considerations are developed to predict the mean characteristics of a turbulent wake at an incidence in the freestream turbulence environment. The analytical approach is based on the Navier-Stokes mean-momentum and continuity equation. The experimentation was carried out in a subsonic wind tunnel using cross-wire anemometry. Experimental data of the flat plate at three incidences and three turbulence levels (0.40, 5.23, and 7.23 percent) from self-similarity considerations are presented to predict the semiempirical correlations for the wake velocity defect, length scale, wake velocity profile, shape factor, and eddy viscosity. The effect of pressure gradient on various parameters is also discussed. It is concluded that the wake velocity defect and shape factor decrease while the length scale and eddy viscosity increase when there is an increase in freestream turbulence. Author

**THREE-DIMENSIONAL SOLUTIONS TO THE EULER EQUATIONS WITH ONE MILLION GRID POINTS**

A. RIZZI (Flygtekniska Forsoksanstalten, Bromma, Sweden) AIAA Journal (ISSN 0001-1452), vol. 23, Dec. 1985, p. 1986, 1987. refs

Three-dimensional solutions to the Euler equations for flow around aircraft wings were computed using standard and dense-size meshes. It was found that the flowfield around a trapezoidal wing like the ONERA M6 wing (freestream M = 0.84; alpha = 3.06 deg) can be accurately represented on a standard-size mesh of about 50,000 grid points. However, for wings of low-aspect ratio, like the subsonic (freestream M = 0.7; alpha = 15 deg) and supersonic (freestream M = 1.5; alpha = 15 deg) Dillner delta wings, a much denser grid of up to a million grid points is required to describe the structure of the vortex flow interacting with the shock waves. I.S.

**SOLUTION OF THE EULER EQUATIONS - EXPLICIT SCHEMES ACCELERATION BY A MULTIGRID METHOD**

V. COUAILLIER (ONERA, Chatillon-sous-Bagneux, France) (Gesellschaft fuer angewandte Mathematik und Mechanik, European Conference on Multigrid Methods, 2nd, Cologne, West Germany, Oct. 1-4, 1985) ONERA, TP, no. 1985-129, 1985, 21 p. refs
(ONERA, TP NO. 1985-129)

A one-dimensional multigrid approach is presented for obtaining explicit solutions for the steady Euler equations expressed in time-marching hyperbolic form. The energy equation is replaced by a Bernoulli relation and the equations are discretized using a Lax-Wendroff scheme for both the time and space components. A linearized stability analysis based on a Fourier analysis is introduced to reduce the computational efforts required at each time step in order to accelerate the convergence of the solution on two coarse grids. An accompanying residual equation is shown to vanish when convergence is achieved, thereby enhancing the accuracy of the method. The results of sample calculations for channel flow, transonic flow, subsonic flow and flows past an airfoil and in a transonic compressor cascade are provided. M.S.K.

### EXPERIMENTAL INVESTIGATION OF THREE DIMENSIONAL SEPARATION ON AN ELLIPSOID-CYLINDER BODY AT INCIDENCE

R. L. SCHMITT and B. P. G. CHANETZ (ONERA, Chatillon-sous-Bagneux, France) AIAA, Fluid Dynamics, Plasma Dynamics, and Laser Conference, 18th, Cincinnati, OH, July 16-18, 1985. 10 p. refs
(AIAA PAPER 85-1686)

An ellipsoid-cylinder model is used for the experimental study of the incompressible turbulent three-dimensional separation which is associated with a vortex formation. The model consists of an oblate half-ellipsoid with a cylindrical extension terminated by a flat base inclined at 45 deg with respect to the model axis, to stabilize the separation on the rear part of the model. The wind tunnel tests are performed for free stream velocities Vo up to 70 m/s and model angles of attack alpha from 0 to 40 deg. Surface flow visualizations and wall pressure measurements permit to select a particularly interesting configuration corresponding to Vo = 50 m/s and alpha = 30 deg for which the three-dimensional separation occurs on the cylindrical part of the model. The separated region, and in particular the vortex emerging from the boundary layer, is first explored by using a five hole pressure probe. The three-directional laser Doppler velocimetry is used as a second measurement technique to determine the mean velocity field and the components of the Reynolds stress tensor. The influence of the sample size on the uncertainty affecting the statistical values is examined. Regarding the velocity field, the two measurement techniques give results in good agreement. Author

**A86-17653**

### FALSE DIFFUSION IN THREE-DIMENSIONAL FLOW CALCULATIONS

A. O. DEMUREN (Karlsruhe, Universitaet, West Germany) Computers and Fluids (ISSN 0045-7930), vol. 13, no. 4, 1985, p. 411-419. refs

This paper presents the derivation of the three principal components of the false or numerical diffusivities which result from the use of first-order upwind difference schemes in the calculation of steady three-dimensional flows. The effects of the false diffusion are illustrated by comparison of the first-order calculations with those with a higher-order scheme and experimental data, for the flow of a row of turbulent jets issuing at right angles to a nearly uniform cross-stream. The adverse effect of the false diffusivities in suppressing the physics of the flow is shown. Author

### A COMPARATIVE STUDY OF THE PARABOLIZED NAVIER-STOKES CODE USING VARIOUS GRID-GENERATION TECHNIQUES

U. K. KAUL and D. S. CHAUSSEE (NASA, Ames Research Center, Moffett Field, CA) Computers and Fluids (ISSN 0045-7930), vol. 13, no. 4, 1985, p. 421-441. refs

The parabolized Navier-Stokes (PNS) equations are used to calculate the flow-field characteristics about the hypersonic research aircraft X-24C. A comparison of the results obtained using elliptic, hyperbolic and algebraic grid generators is presented. The outer bow shock is treated as a sharp discontinuity, and the discontinuities within the shock layer are captured. Surface pressures and heat-transfer results at angles of attack of 6 deg and 20 deg, obtained using the three grid generators, are compared. The PNS equations are marched downstream over the body in both Cartesian and cylindrical base coordinate systems, and the results are compared. A robust marching procedure is demonstrated by successfully using large marching-step sizes with the implicit shock fitting procedure. A correlation is found between the marching-step size, Reynolds number and the angle of attack at fixed values of smoothing and stability coefficients for the marching scheme. Author

### ON A WEAK SOLUTION FOR A TRANSONIC FLOW PROBLEM

C. S. MORAWETZ (New York University, NY) Communications on Pure and Applied Mathematics (ISSN 0010-3640), vol. 38, Nov. 1985, p. 797-817. refs
(Contract N00014-85-K-0195)

The existence of weak solutions for steady state two-dimensional inviscid irrotational compressible flow in an infinitely long channel or in the exterior of an airfoil given the speed upstream at infinity is demonstrated. A weak existence theorem for such a flow, in which shocks arise when the fluid attains a certain speed, is established by adding an artificial viscosity. A new identity derived from the div-curl lemma and a modification of the Lax entropy pairs are given and applied to the solution. C.D.

### SUPERSONIC VISCOUS-INVISCID INTERACTION OF A SWEPT COMPRESSION RAMP WITH A TURBULENT BOUNDARY LAYER

G. R. INGER (Iowa State University of Science and Technology, Ames) AIAA, Fluid Dynamics, Plasma Dynamics, and Lasers Conference, 18th, Cincinnati, OH, July 16-18, 1985. 60 p. refs
(Contract AF-AFOSR-83-0198)
(AIAA PAPER 85-1669)

This paper analyzes the supersonic interaction of a swept infinite compression ramp with an adiabatic turbulent boundary layer by means of a nonasymptotic triple deck approach combined with a nonisotropic eddy viscosity model attributable to Rotta. Fundamentally-based analytical descriptions of the 3-D disturbance flow field are obtained for a wide range of Mach number, Reynolds number, boundary layer shape factor and sweep angles. In particular, the following aspects of the problem are emphasized: (1) the generation of laiarge secondary flow vorticity by the cross flow inside the boundary alyer; (2) fundamental prediction of the dependence of the upstream influence on sweep angle; (3) assessment of the validity of the so-called independence principle, including a determination of the effect of deviations from this principle due to combined compressibility and turbulence effects including the cross-flow component of the interactive turbulence, and (4) examination of the shear stress disturbance region close to the wall to obtain basic predictions for the 3-D skin friction line geometry and flow behavior at the onset of separation. ### EXPERIMENTAL INVESTIGATION OF THREE DIMENSIONAL SEPARATION ON AN ELLIPSOID-CYLINDER BODY AT INCIDENCE

R. L. SCHMITT and B. P. G. CHANETZ (ONERA, Chatillon-sous-Bagneux, France) AIAA, Fluid Dynamics and Plasmadynamics and Lasers Conference, 18th, Cincinnati, OH, July 16-18, 1985. 10 p.
(AIAA PAPER 85-1686)

An ellipsoid-cylinder model is used for the experimental study of the incompressible turbulent three-dimensional separation which is associated with a vortex formation. The model consists of an oblate half-ellipsoid with a cylindrical extension terminated by a flat base inclined at 45 deg with respect ot the model axis, to stabilize the separation on the rear part of the model. The wind tunnel tests are performed for free stream velocities Vo up to 70 m/s and model angles of attack alpha from 0 to 40 deg. Surface flow visualizations and wall pressure measurements permit to select a particularly interesting configuration corresponding to Vo = 50 m/s and alpha = 30 deg, for which the three-dimensional separation occurs on the cylindrical part of the model. The separated region, and in particular the vortex emerging from the boundary layer, is first explored by using a five hole pressure probe. The three-directional laser Doppler velocimetry is used as a second measurement technique to determine the mean velocity field and the components of the Reynolds stress tensor. The influence of the sample size on the uncertainty affecting the statistical values is examined. Regarding the velocity field, the two measurement techniques give results in good agreement. Author

### COMPUTATION OF FLOWFIELDS IN HIGH SOLIDITY AND HIGH TURNING ANGLE CASCADES USING EULER EQUATIONS

B. N. SRIVASTAVA (Avco Everett Research Laboratory, Inc., Everett, MA) and R. BOZZOLA (Avco Corp., Lycoming Stratford Div., CT) AIAA, Fluid Dynamics and Plasmadynamics and Lasers Conference, 18th, Cincinnati, OH, July 16-18, 1985. 17 p. Research supported by the Avco Corp. refs
(AIAA PAPER 85-1705)

Flow problems arising in connection with the design of gas turbine engine components have led to the development of computational methods as design analysis tools. The present study is concerned with the development of two Euler codes for computing flowfields in cascades. One code is based on C-grid topology, while the other is based on H-grid topology. The validity of the computational formulation is established by developing numerical solutions for subsonic and transonic flows in several high turning angle and high solidity turbine cascades. The considered cascades are representative of advanced turbine technology. Attention is given to the numerical approach used for boundary treatments and the artificial damping procedure, the grid generation procedure, stator cascade computations, and rotor cascade calculations. G.R.

### NUMERICAL COMPUTATION OF UNSTEADY TRANSONIC FLOW ABOUT WINGS WITH FLAPS

W. A. SOTOMAYOR (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) and C. J. BORLAND (Boeing Military Airplane Co., Seattle, WA) AIAA, Fluid Dynamics and Plasmadynamics and Lasers Conference, 18th, Cincinnati, OH, July 16-18, 1985. 14 p. Research supported by the Boeing Military Airplane Co. and USAF. refs
(AIAA PAPER 85-1712)

Numerical computations for steady and unsteady transonic flow about highly tapered wings with trailing edge flaps are presented. Control surface boundary conditions for an algorithm known as XTRAN3S are described in this paper. Numerical results and comparisons with experiment are shown for M = .90, .925, .95, and .99 for steady and unsteady flow about a model tested by NLR of the Netherlands. In addition,for M = .95, preliminary work indicates that numerical solutions are exhibiting non-uniqueness. Author

### ON THE NUMERICAL SOLUTION OF NONLINEAR PROBLEMS IN FLUID DYNAMICS BY LEAST SQUARES AND FINITE ELEMENT METHODS. II APPLICATIONS TO TRANSONIC FLOW SIMULATIONS

M. O. BRISTEAU, O. PIRONNEAU (Institut National de Recherche en Informatique et en Automatique, Rocquencourt, France), R. GLOWINSKI (Paris VI, Universite, France), J. PERIAUX, P. PERRIER (Avions Marcel Dassault-Breguet Aviation, Saint-Cloud, France) et al. (DFG, Universitaet Stuttgart, and U.S. Army, Fenomech '84 International Conference on Finite Elements in Nonlinear Mechanics, 3rd, Stuttgart, West Germany, Sept. 10-14, 1984) Computer Methods in Applied Mechanics and Engineering (ISSN 0045-7825), vol. 51, Sept. 1985, p. 363-394. refs

Methods for the numerical solution of the full potential equation modelling transonic flows are presented. It is shown how the general methods discussed in Bristeau et al., (1979) apply to the solution of a class of rather complicated nonlinear problems of industrial interest, namely the numerical simulation of potential transonic flows for compressible inviscid fluids, in two and three dimensions. The governing equations and the various conditions that physical solutions have to verify, such as entropy and Kutta-Joukowsky conditions, are reviewed. The possible existence of multiple physical solutions is considered. The least squares formulation for the continuous problem discussed by Bristeau et al. (1979) is recalled, and the finite element approximation of the formulations of the continuous problem is described. The finite element implementation of the entropy conditions by upwinding of the density in the flow direction is discussed. Various numerical experiments illustrating the possibility of the discussed methods are given. C.D.

**A86-17889**

### SOME RECENT DEVELOPMENTS IN NUMERICAL METHODS FOR TRANSONIC FLOWS

A. JAMESON (Princeton University, NJ) and W. SCHMIDT (Dornier GmbH, Friedrichshafen, West Germany) (DFG, Universitaet Stuttgart, and U.S. Army, Fenomech '84 International Conference on Finite Elements in Nonlinear Mechanics, 3rd, Stuttgart, West Germany, Sept. 10-14, 1984) Computer Methods in Applied Mechanics and Engineering (ISSN 0045-7825), vol. 51, Sept. 1985, p. 467-493. refs

A satisfactory numerical method for calculating steady solutions of the Euler equations for inviscid compressible gas flows and extensions the treatment of the Navier-Stokes equations and time-dependent flows are discussed. Modifications of the Euler equations for faster convergence to a steady state are reviewed, and a spatial discretization scheme which is derived from the integral form of the conservation laws is discussed. A relatively simple form of adaptive dissipation is considered which leads to reasonable satisfactory modelling for shock waves in steady flows. Modifications to improve shock resolution are examined. A class of hybrid multistage time-stepping schemes is presented, and the residual-averaging and multiple-grid schemes are reviewed. The treatment of boundary conditions is summarized, and results showing the influence of variations in parameters and mesh effects are given. C.D.

### DRAG REDUCTION OF PERFORATED AXISYMMETRIC BODIES IN SUPERSONIC FLOW

E. SERBANESCU and G. SAVU (Institutul National Pentru Creatie Stiintifica si Tehnica, Bucharest, Rumania) Journal of Spacecraft and Rockets (ISSN 0022-4650), vol. 22, Nov.-Dec. 1985, p. 663-665. refs

A numerical treatment for self-adaptive boundary layer laminarization is developed for supersonic bodies-of-revolution with perforated surfaces. The aerodynamic mechanism by which upstream (high pressure) boundary flow is induced through the perforated skin and exhausted, again through the skin, at the trailing (low pressure) surfaces of the body, is governed by the Darcy law. Both spindle-shaped and cone-cylinder axisymmetric bodies are treated. O.C.

### THE EFFECT OF THE CURVATURE OF THE EXTERNAL CONTOURS OF TURBINE BLADE PROFILES ON THEIR AERODYNAMIC CHARACTERISTICS [VLIIANIE KRIVIZNY NARUZHNYKH OBVODOV PROFILEI LOPATOK TURBIN NA IKH AERODINAMICHESKIE KHARAKTERISTIKI]

A. V. DEREVIANKO and S. Z. KOPELEV Akademiia Nauk SSSR, Izvestiia, Energetika i Transport (ISSN 0002-3310), Sept.-Oct. 1985, p. 166-170. In Russian. refs

The effect of curvature distribution over the contour of a blade profile on its aerodynamic characteristics is analyzed with particular reference to profile cascades whose contours are described by Bernoulli lemniscates. A criterion for optimum curvature distribution and an algorithm implementing this criterion are proposed. A method is presented for designing blade rings with optimum curvature distribution which meet the engineering, strength, and structural requirements for turbomachine blades. V.L.

### INTAKE AERODYNAMICS

J. SEDDON (Bristol, University, England) and E. L. GOLDSMITH (Royal Aeronautical Establishment, Bedford, England) New York/London, American Institute of Aeronautics and Astronautics/Collins Professional and Technical Books, 1985, 471 p. refs

A comprehensive physical treatment is presented for the fluid dynamics of both subsonic and supersonic aircraft engine air intakes, first treating internal intake duct flow to the engine, from initial freestream conditions, through successively faster speed regimes, and then proceeding to intake external drag. Attention is given to pressure recovery in subsonic intakes, transonic effects of preentry flow, lip separation and transonic throat flow, external and internal supersonic compression, losses in supersonic intakes, and boundary layer bleeds and diverters. Also discussed are the shock oscillation of supersonic intakes, distortion and swirl phenomena, intakes at incidence, and novel intake designs and related devices. O.C.

### DELTA WINGS WITH SHOCK-FREE CROSS FLOW

S. S. SRITHARAN (NASA, Langley Research Center, Institute for Computer Applications in Science and Engineering, Hampton, VA) Quarterly of Applied Mathematics (ISSN 0033-569X), vol. 43, Oct. 1985, p. 275-286. Previously announced in STAR as N84-19282. refs

(Contract NAS1-17070)

In order to have a high level of maneuverability, supersonic delta wings should have a cross flow that is free of embedded shock waves. The conical cross flow sonic surface differs from that of plane transonic flow in many aspects. Well-known properties such as the monotone law are not true for conical cross flow sonic surfaces. By using a local analysis of the cross flow sonic line, relevant conditions for smooth cross flow are obtained. A technique to artificially construct a smooth sonic surface and an efficient numerical method to calculate the flow field are used to obtain cones with smooth cross flow. A.R.H.

### UNSTEADY TRANSONIC FLOWS IN AN AXIAL FLOW COMPRESSOR

A. R. MANWELL Quarterly of Applied Mathematics (ISSN 0033-569X), vol. 43, Oct. 1985, p. 369-383. refs

Some transonic flow problems of the supersonic axial flow compressor which arise in connection with flutter analysis for fan blading are addressed. Unsteady plane transonic flows through a cascade of flat plates are treated as boundary value problems for the reduced wave equations of supersonic and subsonic flow, with particular reference to the rotor in a finite duct and a nonuniform incident stream. The supersonic entry problem is solved for sigma - 0 , pi by Fredholm theory. For small frequencies, it is shown that the solution depend on the duct length, in some cases very significantly. A uniqueness proof is given which requires strong conditions on the incident stream; in an appendix, a counterexample for a differential equation of the same general class is given. C.D.

### THE VORTEX PATTERNS OF DYNAMIC SEPARATION - A PARAMETRIC AND COMPARATIVE STUDY

P. FREYMUTH (Colorado, University, Boulder) Progress in Aerospace Sciences (ISSN 0376-0421), vol. 22, no. 3, 1985, p. 161-208. refs

(Contract AF-AFOSR-81-0037)

The present flow visualization study of vortical pattern development during dynamic separation in accelerating flow around airfoils, for Reynolds numbers of 16, 124, 1000, 5200, 18,500, and 52,000, proceeds to develop a descriptive nomenclature for the effects thus identified. This 'dictionary' is then applied to the comparative study of vortex patterns for several dynamically separating flow configurations. The flow visualization technique used in the photographic portion of the present study is that of TiCl4 smoke generation, and the airfoil is of NACA 0015 profile. O.C.

### SHOCK WAVE/TURBULENT BOUNDARY LAYER INTERACTION AND ITS CONTROL

J. M. DELERY (ONERA, Chatillon-sous-Bagneux, France) Progress in Aerospace Sciences (ISSN 0376-0421), vol. 22, no. 4, 1985, p. 209-280. refs

The interaction between a shock wave and a boundary layer often leads to extremely detrimental effects, especially if the shock is strong enough to separate the boundary layer. When this happens, there occurs a rapid growth of the dissipative region along with a dramatic intensifying of turbulent fluctuations with the frequency occurrence of buffeting. In the present review some fundamental properties of the interaction are first considered for a two-dimensional, adiabatic flow developing on a flat surface. The following features are first examined: upstream interaction length, incipient shock-induced separation and evolution of the boundary layer properties during the interaction process. Supersonic and transonic flows are both considered. In a second part, the means envisaged to control shock-boundary layer interactions are presented, with emphasis on the physics of phenomena involved in this process. Control methods can be classified into two categories: those acting on the boundary layer properties before it enters the shock region (e.g. wall cooling, wall mass transfer, upstream blowing) and those having a local action in the shock foot region itself (e.g. suction or injection, boundary layer removal, passive control). The most appropriate technique depends on the specific application under consideration. Finally, some calculation methods are briefly presented, most of them being restricted to laminar interactions. Author

### LARGE-SCALE SEPARATION AND HYSTERESIS IN CASCADES

A. P. ROTHMAYER (Iowa State University of Science and Technology, Ames) and F. T. SMITH (University College, London, England) Royal Society (London), Proceedings, Series A - Mathematical and Physical Sciences (ISSN 0080-4630), vol. 402, no. 1822, Nov. 8, 1985, p. 83-108. refs

(Contract N00014-76-C-0634; NGT-36-004-800)

An approach using a two-dimensional thin aerofoil, allied with the theory of viscous bluff-body separation, is used to study the initial cross-over from massive separation to an attached flow in a single-row unstaggered cascade. Analytic solutions are developed for the limit of small cascade-spacing. From the analytic solutions several interesting features of the cascade are examined, including multiple-solution branches and multiple regions of hysteresis. In addition, numerical results are presented for several selected aerofoils. Some of the aerofoils are found to contain markedly enlarged regions of hysteresis for certain critical cascade spacings. Author

### COMPUTATION OF UNSTEADY TRANSONIC FLOWS WITH AN IMPLICIT NUMERICAL METHOD FOR SOLVING THE EULER EQUATIONS

J. SIDES (ONERA, Chatillon-sous-Bagneux, France) La Recherche Aerospatiale (English Edition) (ISSN 0379-380X), no. 2, 1985, p. 17-39. refs

The Lerat et al. (1982) implicit method for accurate and efficient solution of the Euler equations is presently applied to the computation of transonic flows, with a view to the prediction of aeroelastic phenomena over airfoils. Numerical applications are performed which were chosen among test cases defined by AGARD's 'Standard Aeroelastic Configurations' working group, relating to the NACA 64A010 airfoil in pitch oscillations and to the NLR 7301 supercritical airfoil with an oscillating flap. The results obtained are compared with experimental data and with the transonic small disturbance approach. O.C.

**THEORETICAL AND EXPERIMENTAL FLOW FIELDS FOR A SUPERSONIC CRUISE FIGHTER FOREBODY**

S. F. YAROS Nov. 1985 43 p refs

(NASA-TM-86450; L-15914; NAS 1.15:86450) Avail: NTIS HC A03/MF A01 CSCL 01A

The capability of two numerical methods to predict the flow field about a representative supersonic cruise aircraft was examined. The two codes were a small-disturbance transonic program of Boppe and a conservative form full-potential transonic program of Shankar and Szema. For the former code, comparisons were made with wind-tunnel data at Mach numbers of 0.6, 0.9, and 1.2 and angles of attack of 0 deg, 5 deg, and 10 deg (7.5 deg instead of 10 deg at a Mach number of 1.2). Predictions from the two codes were compared at a Mach number of 1.2 and an angle of attack of 7.5 deg. The comparison criteria were contours of local angle of attack, local angle of sideslip, and local Mach number. The comparisons indicated that both codes may be considered useful for design applications, depending on the degree of accuracy required by the user's solution. Both solutions show an inaccuracy in their predictions, particularly as Mach number and/or angle of attack increases, because of their lack of viscous effects and any mechanisms to predict vortex development. **AN AIRFOIL FLUTTER MODEL SUSPENSION SYSTEM TO ACCOMMODATE LARGE STATIC TRANSONIC AIRLOADS Final Report**

W. H. REED, III Oct. 1985 39 p refs

(Contract NAS1-17686)

(NASA-CR-177998; NAS 1.26:177998; D-8402-3) Avail: NTIS HC A03/MF A01 CSCL 01A

A pitch/plunge flutter model suspension system and associated two-dimensional MBB-A3 airfoil models is described. The system is designed for installation in the Langley 6-by-19-inch and 6-by-18-inch transonic blowdown wind tunnels to enable systematic study of the transonic flutter characteristics and static pressure distributions of supercritical airfoils at transonic Mach numbers. A compound spring suspension concept is introduced which simultaneously meets requirements for low plunge-mode stiffness, lightweight suspended model, and large steady lift due to angle of attack without the need for excessive static deflections of the plunge spring. The system features variable pitch and plunge frequencies, changeable airfoil rotation axes, and a self aligning control system to maintain a constant mean position of the model with changing airload. **A FOURTH-ORDER SCHEME FOR THE UNSTEADY COMPRESSIBLE NAVIER-STOKES EQUATIONS Final Report**

A. BAYLISS, P. PARIKH, L. MAESTRELLO, and E. TURKEL Oct. 1985 26 p refs Submitted for publication
(Contract NAS1-17070; NAS1-17130)
(NASA-CR-177994; ICASE-85-44; NAS 1.26:177994) Avail: NTIS HC A03/MF A01 CSCL 01A

A computational scheme is described which is second-order accurate in time and fourth-order accurate in space (2-4). This method is applied to study the stability of compressible boundary layers. The laminar compressible Navier-Stokes equations are solved with a time harmonic inflow superimposed on the steady state solution. This results in spatially unstable modes. It is shown that the second-order methods are inefficient for calculating the growth rates and phases of the unstable modes. In contrast the fourth-order method yields accurate results on relatively course meshes. Author

**SEMIEMPIRICAL METHOD FOR PREDICTING VORTEX-INDUCED ROLLING MOMENTS**

D. O. ALLISON and P. J. BOBBITT Nov. 1985 19 p refs
(NASA-TM-87579; L-15986; NAS 1.15:87579) Avail: NTIS HC A02/MF A01 CSCL 01A

A method is described for the prediction of rolling moments on a wing penetrating a vortex velocity field generated by a large aircraft. Rolling moments are determined from lifting pressure coefficients computed with an inviscid-flow linear panel method. Two empirical corrections are included to account for the lifting efficiency of an airfoil section and the local stall on the wing. Predicted rolling moments are compared with those from two windtunnel experiments. Results indicate that experimental rolling moments, for which the Reynolds number of the following wing is low, should be interpreted with caution. Author

**VELOCITY AND TEMPERATURE DECAY CHARACTERISTICS OF INVERTED-PROFILE JETS**

U. VONGLAHN, J. GODDYKOONTZ, and C. WASSERBAUER 1985 32 p refs To be presented at the 24th Aerospace Sciences Meeting, Reno, Nevada, 6-9 January 1986; sponsored by American Inst. of Aeronautics and Astronautics
(NASA-TM-87159; E-2681; NAS 1.15:87159; AIAA-86-0312)
Avail: NTIS HC A03/MF A01 CSCL 01A

In order to design efficient, lightweight flap systems for future engine under-the-wing STOL aircraft, the velocity and temperature decay rate of the jet plume must be increased relative to that for single-stream nozzles in order to provide local flap loads and structural temperatures within acceptable limits. The jet plume decay rate of dual flow engines can be increased by resorting to inverted-profile velocity and temperature nozzle concepts. The peak axial decay characteristics of model-scale, two-stream inverted-profile nozzle flows are empirically correlated. Also discussed are the radial and spreading characteristics of inverted-profile nozzle flows. Author

**A MODEL FOR CLOSING THE INVISCID FORM OF THE AVERAGE-PASSAGE EQUATION SYSTEM**

J. J. ADAMCZYK, R. A. MULAC (Sverdrup Technology, Inc., Middleburg Heights, Ohio), and M. L. CELESTINA (Sverdrup Technology, Inc., Middleburg Heights, Ohio) 1985 15 p refs To be presented at the 31st International Gas Turbine Conference, Dusseldorf, West Germany, 8-12 June 1986; sponsored by the American Society of Mechanical Engineers
(NASA-TM-87199; E-2854; NAS 1.15:87199) Avail: NTIS HC A02/MF A01 CSCL 01A

A mathematical model is proposed for closing or mathematically completing the system of equations which describes the time average flow field through the blade passages of multistage turbomachinery. These equations referred to as the average passage equation system govern a conceptual model which has proven useful in turbomachinery aerodynamic design and analysis. The closure model is developed so as to insure a consistency between these equations and the axisymmetric through flow equations. The closure model was incorporated into a computer code for use in simulating the flow field about a high speed counter rotating propeller and a high speed fan stage. Results from these simulations are presented. Author

Applications of numerical procedures for solution of the Euler equations to three dimension studies, to the production of body-adapted grids, to the construction of block-structured differential grids, to the formulation of the boundary transition conditions, and to the determination of aerodynamic factors are discussed. Application of a finite volume method to the formulation and discretization of the conservation equations; and application of the Navier-Stokes solutions in two dimensions to the study of numerical aerodynamics using supercomputers of the CRAY 1S type are considered. Investigations of separated flow and vorticity are reviewed. Further investigation of the Navier-Stokes equations are recommended to develop physical model representations on transition and turbulence and to study their applicability to 3-D configurations. An axisymmetric supersonic viscous flow over a blunt body is simulated with solution of the unsteady Navier-Stokes equations with thin layer approximation. The numerical algorithm used to solve the conservation law form for the thin layer Navier-Stokes equations for time-dependent compressible flow is based on an implicit iterative scheme. The convergence of the numerical algorithm and the stability of the corresponding nonlinear system of equations are ensured by selected discretization parameters and dissipative coefficients. Finite difference solutions of the Navier-Stokes and Euler equations were applied to study a 3-D incompressible flow over a flat wing using an artificial compressibility. The results for viscous and inviscid flows were compared. The truncation errors near the leading edge resulting in numerical dissipation and vorticity in Euler solution are studied with a 2-D inviscid flow over a vertical plate. Numerical simulations are made to study the breakdown of an isolated vortex, the flow over a 2-D car model and the viscous flow over a backward facing step. Vortex stability and bubble structure are studied. Author (ESA)

Viscous transonic flows over a semiconical-cylindrical configuration are simulated on a CRAY 1S supercomputer using a modified version of the explicit implicit McCormack method based on the finite volume method and using the level concept for measuring the pressure distribution to study the asymptotic behavior of the flow on body surfaces. Measures of the pressure distributions are discussed for angles of attack ranging from 0 to 19 deg. Flow vorticity and asymptotic wall flow line direction are studied using an improved mesh grid. The calculations allow the determination of the forces resulting from a flow over a body to be performed. The integration method is applied to simulate the flow around a body. Author (ESA)

The implicit Beam and Warming difference procedure is applied to solve the axisymmetric Euler and Navier-Stokes equations in thin layer approximation used to study the effects of viscosity in supersonic flow over blunt bodies at high Reynolds numbers. A numerical program is developed and its economical application regarding time saving and calculation speed is tested by calculating the laminar flows over a semispherical cylindrical configuration and over a spherical blunt cone with adiabatic and isothermal walls at Mach numbers from 12 to 20.3. The theoretical results show good agreement with experiments. The numerical simulation allows the prediction of the separation point. The validity of the thin layer approximation for flows with large separation area is demonstrated by comparing the thin layer equations with the full Navier-Stokes equations for supersonic flow over a blunt body of revolution. The effects of friction and separation on flow distribution are calculated with three dimensional boundary methods to develop a modular program system for solution of the Navier-Stokes and Euler equations for profiles, wings, and blunt bodies and for investigation of impact-boundary layer interaction on plate and profile, of the flow over a semicylinder on a plate, of boundary layer - pressure wave interaction, and wake flows. The effects of the grids and the synthetic dissipation on the solution are studied and turbulent model modules are tested to simulate turbulent flows. The solutions are verified with comparative calculations. Tests are performed with Poiseuille flow, Couette flow, and the boundary layer on a plane plate. The development of simple models of the impact-boundary layer interaction is based on the relation between the separation bubble length and Mach and Reynolds numbers and the impact force. Supersonic flows over delta wings are studied using the Euler procedure associated with the shock fitting method to determine the head shock wave and using the potential procedure with the shock capturing method to determine the position and force of the head shock wave. The flow distribution can be economically described with the potential procedure and not with the Euler procedure. The entropy rises due to compression shocks along the flow lines and the entropy gradients due to the compression shock curvature can be explained with the Euler equations. The results of the Euler solution for a delta wing were compared with those of the potential solution using photographs. Further investigations are recommended to study the influence of the elimination of entropy variations on the solutions. Author (ESA)

The trailing edge in subcritical and supercritical flows is studied regarding pressure, velocity and friction effects to determine the relation between the Kutta angle in inviscid flow and the profile curvature due to compression shock on the suction side of the airfoil profile. The Euler procedure is used to determine the correlation between the numerical results. The vorticity in supercritical flow is studied with solutions of potential theory and cinematically. Results show that profile curvature is due to pressure loss at rest, nonuniqueness of the numerical methods for the trailing edge, and possible relaxation of the potential method. Author (ESA)

**A NEW EULER ALGORITHM BASED ON CHARACTERISTIC FLUX EXTRAPOLATION**

A. EBERLE *In* DGLR The State of Development Research in Numerical Aerodynamics in West Germany p 93-100 1984

Avail: NTIS HC A08/MF A01

An asymmetric weighting procedure based on the eigenvalue decomposition of the Euler equations is developed for flow variables at cell faces to calculate flux extrapolation. Left and right states are defined by linear combinations of the flow quantities of the two adjacent cells on each side of a volume cell face. They are weighted with elements of the split matrix to obtain the averaged flow values and the Euler fluxes. Cell midpoint values are updated with the centered difference operator applied on the fluxes. The scheme is accurate in space and time in the pseudo-unsteady option and is entropy-conditioned. **ALTERNATE ALTITUDE TESTING OF SOLID CLOTH PARACHUTE SYSTEMS Final Report**

W. P. LUDTKE 10 Oct. 1985 85 p
(AD-A157068; NSWC/TR-85-24) Avail: NTIS HC A05/MF A01 CSCL 01C

The flight testing of solid cloth parachutes sometimes calls for unique test conditions such as very high altitudes for extremely low dynamic pressures, or heavy payloads, such as cargo tested at low attitudes. Each of these conditions may require exceptional test equipment and/or facilities such as balloon-borne and rocket-assisted high-altitude vehicles or large cargo aircraft for low altitude heavy payloads. These requirements can add significantly to the overall test program cost and complexity. In order to reduce development test costs and complexity, a theoretical study was conducted to determine the possibility of altering the test conditions in a manner which would permit the use of lower cost test assets and still obtain same parachute opening shock forces and stress distributions. The results show that if the system mass and test velocity are varied, as shown in the accompanying method for a constant Ballistic Mass Ratio (BMR) scale parameter, the opening shock force and stress distributions are constant for all altitudes. A technique is described which theoretically permits parachute systems to be tested under more convenient conditions of altitude, velocity, and system mass resulting in the same conditions of opening shock force and parachute stress distribution. The applicability of the thin layer approximation method for the description of thin separation bubbles and large separation areas and data acquisition on the structure of separated three dimensional flow distribution is studied using the numerical simulation of separated laminar supersonic flows over blunt bodies of revolution. The influence of numerical damping on the consistency, stability, convergence and accuracy of the finite difference scheme of Beam and Warming is studied. The topologic stucture of the separation area depends on the Reynolds number. The thin layer approximation allows an accurate description of flows with small or large separation areas at high Reynolds numbers. Author (ESA)

Computational aerodynamic design methods were developed to study the interference transonic flow on engine-wing and body-wing configurations using the hybrid method and flow simulation in wind tunnels. Transonic wing technology was improved regarding fineness ratio, lift and zero moment, stability and buffeting limit on airfoils with economical production methods. Design criteria for transonic wings strong interference were determined in studying the wing-body transition area with existing and newly designed shapes, and the engine-wing interference area with half and complete models. Measurements in subsonic and transonic flows were made using a turbo-powered simulator. High lift systems on transonic wings were studied to improve flap efficiency based on the Swept Constant Chord Halfmodel results, and to design high lift principles for a transonic wing as used on the A-320 aircraft. H. OSAKA, T. YAMAGUCHI, and Y. KAGEYAMA *In its* Memoirs of the Faculty of Engineering, Yamaguchi University, Vol. 36, No. 1 p 25-29 Oct. 1985 refs In JAPANESE; ENGLISH summary
(REPT-1) Avail: NTIS HC A09

Measurements of trailing vortices shedding from a row of wing placed in the uniform flow were made to investigate the properties of those. The wing used has a span of 30 mm and a chord of 20 mm and has a rectangular planform. Velocity profiles were measured at several attack angles and spanwise distance between the wings. In all cases the trailing vortices can be formed behind a row of wing and the spanwise variation of the U-component of mean velocity is produced by those vortices. The path of trailing vortex directs downwards with increasing the attack angle, while its path has a different tendency due to the spanwise distance between the wings. Author

**THE PROPERTIES OF A ROW OF TRAILING VORTICES GENERATED IN THE UNIFORM FLOW. SHAPE OF TRAILING VORTEX AND ITS STREAMWISE VARIATION**

H. OSAKA, T. YAMAGUCHI, and Y. KAGEYAMA *In its* Memoirs of the Faculty of Engineering, Yamaguchi University, Vol. 36, No. 1 p 31-36 Oct. 1985 refs In JAPANESE; ENGLISH summary
(REPT-2) Avail: NTIS HC A09

The measurements of trailing vortices behind a row of wing were made to examine mainly the shape and strength of those. Results show that the V- and W-component of mean velocity is produced by the trailing vortex, and that the secondary currents generated by those vortices direct downwards at the mid-span of wings, while upwards at the middle between the wings. The vortex wandering phenomenon is observed by the secondary flow vectors. The strength of trailing vortex increases with the attack angle. Author

**STUDIES ON THE INTERFERENCE OF WINGS AND PROPELLER SLIPSTREAMS Ph.D. Thesis**

R. PRABHU 1985 114 p Previously announced as N85-17553
Avail: Univ. Microfilms Order No. DA8517782

The small disturbance potential flow theory is applied to determine the lift of an airfoil in a nonuniform parallel stream. The given stream is replaced by an equivalent stream with a certain number of velocity discontinuities, and the influence of these discontinuities is obtained by the method of images. Next, this method is extended to the problem of an airfoil in a nonuniform stream of smooth velocity profile. This model allows perturbation velocity potential in a rotational undisturbed stream. A comparison of these results with numerical solutions of Euler equations indicates that, although approximate, the present method provides useful information about the interaction problem while avoiding the need to solve the Euler equations. **THE EXPERIMENTAL DETERMINATION OF THE SUBSONIC AERODYNAMIC CHARACTERISTICS OF AN OGIVE-CYLINDER BODY INCLUDING A COMPARISON WITH THEORETICAL ESTIMATES, VOLUME 1**

D. I. T. P. LLEWELYN-DAVIES Jun. 1985 78 p refs
(CAR-8509; ISBN-0-9477-67-24-X) Avail: NTIS HC A05/MF A01

Wind tunnel tests made on an ogive cylinder body of 6:1 fineness ratio are reported. The distribution of pressure on the body was measured over an incidence range of -1 to 10 degrees. The local loading distributions were obtained by integration of the pressure coefficients; further integration yielded the overall normal force and pitching moment coefficients and hence the center of pressure position. It is shown that the aerodynamic characteristics are very sensitive to conditions in the base region and that unexpectedly large loadings are present over the last 10% of the body length. It is indicated that the bluff asymmetric model support system may be the source of some additional interference effects at the higher incidences, even though it is some 3.7 body diameters downstream of the base. The experimental results are compared with theoretical estimates obtained by an inviscid ring-source method of estimation for axisymmetrical bodies. E.A.K.

**RELATIVE ADVANTAGES OF THIN-LAYER NAVIER-STOKES AND INTERACTIVE BOUNDARY-LAYER PROCEDURES**

U. MEHTA, K. C. CHANG (Douglas Aircraft Co., Long Beach, Calif.), and T. CEBECI (Douglas Aircraft Co., Long Beach, Calif.) Nov. 1985 52 p refs

(NASA-TM-86778; A-85346; NAS 1.15:86778) Avail: NTIS HC A04/MF A01 CSCL 01A

Numerical procedures for solving the thin-shear-layer Navier-Stokes equations and for the interaction of solutions to inviscid and boundary-layer equations are described and evaluated. To allow appraisal of the numerical and fluid dynamic abilities of the two schemes, they have been applied to one airfoil as a function of angle of attack at two slightly different Reynolds numbers. The NACA 0012 airfoil has been chosen because it allows comparison with measured lift, drag, and moment and with surface-pressure distributions. Calculations have been performed with algebraic eddy-viscosity formulations, and they include consideration of transition. The results are presented in a form that allows easy appraisal of the accuracy of both procedures and of the relative costs. The interactive procedure is computationally efficient but restrictive relative to the thin-layer Navier-Stokes procedure. The latter procedure does a better job of predicting drag than does the former. In both procedures, the location of transition is crucial for accurate or detailed computations, particularly at high angles of attack. When the upstream influence of pressure field through the shear layer is important, the thin-layer Navier-Stokes procedure has an edge over the interactive procedure. Author

**HYPERSONIC CHARACTERISTICS OF AN ADVANCED AEROSPACE PLANE AT MACH 20.3**

R. S. MCCANDLESS Dec. 1985 28 p refs

(NASA-TM-86435; L-15953; NAS 1.15:86435) Avail: NTIS HC A03/MF A01 CSCL 01A

Wind-tunnel studies have been performed in the Langley Hypersonic Helium Tunnel Facility to obtain static longitudinal and lateral-directional aerodynamic characteristics of an advanced aerospace plane concept. The nominal test conditions are a Mach number of 20.3 and a Reynolds number of 6.8 x 10 to the 6th power per foot at angles of attack from 0 to 25 deg and angles of sideslip of -3 and 0 deg. Stability and control characteristics are obtained for several deflections of the elevators, elevons, and rudder. In addition, a modified canopy is examined. The results indicate that this vehicle is longitudinally stable at angles of attack near the maximum lift-drag ratio. Also, the vehicle is shown to be directionally unstable with positive dihedral effect. Author

**A CONSISTENT SPATIAL DIFFERENCING SCHEME FOR THE TRANSONIC FULL-POTENTIAL EQUATION IN THREE DIMENSIONS**

S. D. THOMAS and T. L. HOLST Dec. 1985 18 p refs

(NASA-TM-86716; REPT-85213; NAS 1.15:86716) Avail: NTIS HC A02/MF A01 CSCL 01A

A full-potential steady transonic wing flow solver has been modified so that freestream density and residual are captured in regions of constant velocity. This numerically precise freestream consistency is obtained by slightly altering the differencing scheme without affecting the implicit solution algorithm. The changes chiefly affect the fifteen metrics per grid point, which are computed once and stored. With this new method, the outer boundary condition is captured accurately, and the smoothness of the solution is especially improved near regions of grid discontinuity. Author

**SEPARATED TRANSONIC AIRFOIL FLOW CALCULATIONS WITH A NONEQUILIBRIUM TURBULENCE MODEL**

L. S. KING and D. A. JOHNSON Nov. 1985 20 p refs

(NASA-TM-86830; A-85397; NAS 1.15:86830) Avail: NTIS HC A02/MF A01 CSCL 01A

Navier-Stokes transonic airfoil calculations based on a recently developed nonequilibrium, turbulence closure model are presented for a supercritical airfoil section at transonic cruise conditions and for a conventional airfoil section at shock-induced stall conditions. Comparisons with experimental data are presented which show that this nonequilibrium closure model performs significantly better than the popular Baldwin-Lomax and Cebeci-Smith equilibrium algebraic models when there is boundary-layer separation that results from the inviscid-viscous interactions. **INVESTIGATION OF A SUPERSONIC CRUISE FIGHTER MODEL FLOW FIELD**

D. E. REUBUSH and E. A. BARE Nov. 1985 150 p refs

(NASA-TM-86361; L-15884; NAS 1.15:86361) Avail: NTIS HC A07/MF A01 CSCL 01A

An investigation was conducted in the Langley 16-Foot Transonic Tunnel to survey the flow field around a model of a supersonic cruise fighter configuration. Local values of angle of attack, side flow, Mach number, and total pressure ratio were measured with a single multi-holed probe in three survey areas on a model previously used for nacelle/nozzle integration investigations. The investigation was conducted at Mach numbers of 0.6, 0.9, and 1.2, and at angles of attack from 0 deg to 10 deg. The purpose of the investigation was to provide a base of experimental data with which theoretically determined data can be compared. To that end the data are presented in tables as well as graphically, and a complete description of the model geometry is included as fuselage cross sections and wing span stations. Measured local angles of attack were generally greater than free stream angle of attack above the wing and generally smaller below. There were large spanwise local angle-of-attack and side flow gradients above the wing at the higher free stream angles of attack.

**FUNDAMENTAL STUDY OF FLOW FIELD GENERATED BY ROTORCRAFT BLADES USING WIDE-FIELD SHADOWGRAPH**

S. P. PARTHASARATHY, Y. I. CHO, and L. H. BACK 1 Oct. 1985 41 p refs

(Contract NAS7-918)

(NASA-CR-176443; JPL-PUB-85-64; NAS 1.26:176443) Avail: NTIS HC A03/MF A01 CSCL 01A

The vortex trajectory and vortex wake generated by helicopter rotors are visualized using a wide-field shadowgraph technique. Use of a retro-reflective Scotchlite screen makes it possible to investigate the flow field generated by full-scale rotors. Tip vortex trajectories are visible in shadowgraphs for a range of tip Mach number of 0.38 to 0.60. The effect of the angle of attack is substantial. At an angle of attack greater than 8 degrees, the visibility of the vortex core is significant even at relatively low tip Mach numbers. The theoretical analysis of the sensitivity is carried out for a rotating blade. This analysis demonstrates that the sensitivity decreases with increasing dimensionless core radius and increases with increasing tip Mach number. The threshold value of the sensitivity is found to be 0.0015, below which the vortex core is not visible and above which it is visible. The effect of the optical path length is also discussed. Based on this investigation, it is concluded that the application of this wide-field shadowgraph technique to a large wind tunnel test should be feasible. In addition, two simultaneous shadowgraph views would allow three-dimensional reconstruction of vortex trajectories. Author

**A RAPID METHOD FOR ESTIMATING EQUIVALENT PARABOLIC POLARS FROM WIND-TUNNEL TESTS**

D. E. LEAN and S. P. FIDDES Apr. 1985 19 p
(AD-A159559; RAE-TM-AERO-2034; DRIC-BR-96601) Avail: NTIS HC A02/MF A01 CSCL 14B

A method for obtaining a best-fit parabolic drag polar from measured force results is presented. The method is used in estimating the blockage correction due to separated flow that must be applied to wind tunnel results. An important part of the method is the use of computer graphics to identify the part of the measured drag polar that may best be described by a parabola, and thus used as the basis for a curve fit. The method is fast, when compared to existing curve-fitting techniques, and suited to use with an online data reduction system. GRA

**VORTICES AND PRESSURE WAVES AT TRAILING EDGES**

F. SEILER and J. SRULIJES 16 Aug. 1984 10 p refs Presented at 16th International Congress on High Speed Photography and Photonics, Strasbourg, France, 27-31 Aug. 1984
(ISL-CO-224/84) Avail: NTIS HC A02/MF A01

Shock tube experiments using differential interferometry were carried out to investigate compressible subsonic flows around and behind flat plates and cylinders. Pictures taken at framing speeds up to 2 million frames/sec second and streak records show that the trailing edge vortex separation induces pressure waves moving upstream. Each vortex separation is related to the formation of a pressure wave. The flow around the bodies is influenced by the shedding frequency and is possibly coupled with the wake. After a symmetrical onset, the process of vortex separation and pressure wave generation develops into an asymmetrical wake with alternating separation. The experiments show that the dynamics of vortices close to the trailing edge is practically inviscid and incompressible. The pressure waves moving upstream must be treated as a problem of purely compressible nature. Author (ESA)

**DAMPING OF THE ROLLING MOTION OF FULL CALIBER FIN-STABILIZED PROJECTILES IN SUPERSONIC FLIGHT**

M. GIRAUD 21 Nov. 1984 17 p refs Presented at 8th International Symposium on Ballistics, Orlando, Fla., 23-25 Oct. 1984
(ISL-CO-233/84) Avail: NTIS HC A02/MF A01

Simultaneous measurements conducted on fin-stabilized projectiles in supersonic flight by recording the longitudinal velocity (V) with a Doppler radar and the roll velocity (p) by a radioelectric telemetering device are used to determine the variation of the roll damping moment coefficient as a function of the reduced roll velocity p/V. The variation of p/V as a function of the distance travelled is also determined. Launching the projectiles with a glide band at different initial velocities from gun barrels with different angles of twist increases the range of the reduced roll velocities in the ratio of 1 to 4. The roll damping moment coefficient varies strongly in the ratio of 1 to 8.5. In the Mach number range from 1.5 to 3.3, the action of the Mach number on the coefficient is shown. The proportionality of the roll damping moment coefficient to the reduced roll velocity is verified over the range 12 to 44 rps. Author (ESA)

(ISL-CO-236/84) Avail: NTIS HC A02/MF A01

The possibility to obtain high velocity shaped charge jets characterized by a very low velocity gradient is studied using one-dimensional calculations and experimental flash X-ray observations. Results show that it is possible to form high velocity jets with 0.5 km/sec velocity difference between tip and rear of the jet with a kinetic energy equivalent to that of classical stretching jets. Comparison of jets is used to discuss analytical models employed to evaluate velocities, break-up, and penetration of shaped charge jets. Author (ESA)

**TEST CASES FOR INVISCID FLOW FIELD METHODS**

Loughton, England May 1985 336 p refs
(AGARD-AR-211; ISBN-92-835-1497-1) Avail: NTIS HC A15/MF A01

The escalating costs and the continuing limitations of wind tunnel testing together with the growing imperative to achieve the optimal design have rapidly increased the importance of computational fluid dynamics in the design of military aircraft. At relevant Reynolds numbers, inviscid flow methods continue to play an essential role in this design process. In recognition of this, the AGARD Fluid Dynamics panel established Working Group 07 to specify relevant reference test cases to serve as validation bases for those developing new methods with improved accuracy and cost-effectiveness. These cases further serve as check cases for those learning to use existing production codes. The recommendations of the Working Group are presented.

H. NORSTRUD *In* AGARD Test Cases for Inviscid Flow Field Methods 56 p May 1985 refs
Avail: NTIS HC A15/MF A01

Most of the obtained solutions to fluid flow problems are based on irrotational motion and, hence, can be grouped together as potential flow solutions. In many practical cases such potential approximations yields satisfactory results as compared to a rotational flow solution. The Mach number contours around an airfoil at supersonic speed is shown. For flows with strong entropy variation in the flow field the situation, however, is changed. This is especially true for embedded shocks. The Mach number contour around a cylinder for M sub infinity less than 1, and the corresponding streamlines are illustrated. The major reason behind the discrepancy between a rotational and irrotational solution lies in the fact that the potential flow solution does not satisfy the Rankine-Hugoniot jump condition across a shock. As it can be seen, an irrotational solution like the full potential solution or the transonic small perturbation solution (TSP), will yield a larger Mach number jump across the shock as compared to the equivalent rotational or Euler solution. Furthermore, the shock location will differ between a rotational and irrotational solution. It must be stated that for flows with complex shock patterns and for flows with inherent vorticity the method of solution adopted must be based on the Euler equations. The flow field around a modern combat aircraft is well suited to serve as an example to this. The calculated pressure distribution around an aircraft forebody at M sub infinity is shown. Author

**NUMERICAL METHODS**
J. W. BOERSTOEL *In* AGARD Test Cases for Inviscid Flow Field Methods 7 p May 1985 refs
Avail: NTIS HC A15/MF A01

A survey of numerical techniques used in computational simulations of Euler flows is presented. The number of techniques reported in literature is so large that a detailed description of all of them is out of scope. Therefore, this survey is concentrated to sketching only the more important numerical topics, and pointing out differences in possible approaches. The general approach to the numerical solution of the initial boundary value problem of the Euler equations consists of two major steps. In the first step the flow equations, the boundary conditions, and the initial conditions of the continuum-model formulation of the problem are replaced by a large system of algebraic equations (discretization). In the second step the resulting system of algebraic equations is solved (solution). The discretization process reduces to splitting the (t,x,y,z)-space into small elementary volumes called cells (grid generation), and writing down, for each cell, algebraic approximations of the conservation equations, of the initial conditions, and of boundary conditions. The solution of the algebraic equation system is discussed, and the topic of well-posedness of the numerical problem is briefly discussed. Author

**EXACT SOLUTIONS TO TRANSONIC AND SUPERSONIC FLOWS**
G. CHIOCCHIA *In* AGARD Test Cases for Inviscid Flow Field Methods 14 p May 1985 refs
Avail: NTIS HC A15/MF A01

A survey of the most important analytical solutions for transonic and supersonic flows is presented. Particular attention is paid to the transonic cases, where the presence of embedded supersonic regions of a priori unknown extension causes considerable difficulties to the numerical computations and raises the need for reference test cases. Exact analytical transonic solutions are rare and not always adequate for checking practical cases. For this reason some approximate analytical solutions are also presented; in this case, however, the approximations must be well known in advance and their numerical effects must be limited. As a general standard of judgement, solutions in which the approximation consists in the replacement of partial differential equations by finite difference equations are excluded. Closed form or series solutions for two or three cases of approximate equations whose validity fields are well established are accepted. Author

**NUMERICAL SOLUTIONS OF TWO-DIMENSIONAL REFERENCE TEST CASES**
H. VIVIAND *In* AGARD Test Cases for Inviscid Flow Field Methods 68 p May 1985 refs
Avail: NTIS HC A15/MF A01

Selected numerical solutions of the two dimensional reference test cases are presented and the quality if not the absolute accuracy of these solutions are assessed. The numerical methods used to solve the Euler equations are not taken into consideration in the present discussion, and the numerical solutions available for a given test case are evaluated essentially through cross-comparisons of these solutions and by taking into account some known features of the exact (unknown) solution. The present evaluation has shown the importance of the outer boundary position in relation with the boundary conditions and the numerical treatment applied at this boundary. It seems that the minimum distance at which this boundary should be located in order to achieve a given accuracy can vary to a very large extent depending on the boundary treatment. This is an important question which requires detailed studies of all the factors involved. Whereas the trailing edge problem and the Zierep singularity problem change in nature when viscous effects are taken into account, the problem of the far field treatment (outside the viscous wake) remains exactly the same at high Reynolds numbers. **NUMERICAL SOLUTIONS FOR THREE-DIMENSIONAL CASES: SWEPT WINGS**
P. SACHER *In* AGARD Test Cases for Inviscid Flow Field Methods 110 p May 1985 refs
Avail: NTIS HC A15/MF A01

The simplest swept wing geometry of practical interest was Test Case 11 and 12, ONERA M6, with constant section, moderate Aspect Ratio = 3.8 and only 30 deg leading edge sweep. But even this simple planform produced in TC11 with 3.06 deg angle of attack the rolling up of a Tip-Vortex which may contribute to induced drag. The numerical analysis of the nonlinear wake leaving the trailing edge of a lifting wing including the rolling up at the wing tips is one of the most promising aspects of the potential of solving the Euler equations at considerably higher cost in place of Full Potential equation. Consequently the complexity of a realistic transport type planform with twist, camber, variations of section profiles and breakpoints in leading and/or trailing edge sweep can be represented by Test Case 16, NASA AMES SWEPT WING. More or less, all additional problems in computation of the flow field are due to mesh-grid generation and the increase of the number of grid points which are necessary to simulate the flow sufficiently accurate. Only one contribution was obtained for this Test Case. Author

**NUMERICAL SOLUTIONS FOR THREE-DIMENSIONAL CASES: DELTA WINGS**

J. H. B. SMITH *In* AGARD Test Cases for Inviscid Flow Field Methods 94 p May 1985 refs

Avail: NTIS HC A15/MF A01

Wings of delta planform present the real problems of estimating wave drag and representing vortex flows in their simplest form. Any method of calculation aiming to contribute to these problems should be capable of performing well on such simple shapes. On the other hand, there is no evidence that reliable solutions for such simple shapes already exist. It was decided to seek solutions for wings of delta planform for conditions which are relevant to wave-drag estimation and vortex-flow prediction. For a shape which is reasonably slender, at a Mach number sufficiently greater than unity, the flow is supersonic everywhere, so that there is no upstream influence, and the flow can, in principle, be calculated by a space marching method. The final considerations affecting the choice of case are that the shape should be simple, and that experimental measurements should exist. The first makes it easy to ensure that the description of the shape is complete and unambiguous, and makes it possible for all potential computers to represent the shape in their programs. The second, while not strictly necessary and perhaps even irrelevant to the assessment of the accuracy of inviscid calculations, does provide an assurance that solutions judged to be mathematically accurate are not in serious conflict with physical reality. **CONCLUDING REMARKS Abstract Only**

H. YOSHARA *In* AGARD Test Cases for Inviscid Flow Field Methods 1 p May 1985

Avail: NTIS HC A15/MF A01

It may be recalled that the primary purpose of the WG07 was the generation of relevant Euler solutions, both planar and 3D, to serve as Reference Test Cases which developers of Euler methods could use to assess their codes. Since such Reference Test Cases in most cases must themselves be generated numerically, there was initial concern as to the meaningfulness of this objective. The quality of the results produced by the many dedicated contributors has largely dispelled this concern. Except for a few instances, the numerical algorithms used by the contributors within the flow field and at the boundaries were sound. The relative accuracies of the various contributions were due in large part to the density and extent of the mesh used, though the quality of the artificial viscosity used was also an important factor. The planar airfoil solutions recommended herein should serve as reliable Reference Test Cases. The 3D cases understandably are relatively less reliable and must at present be considered as interim Test Cases to serve as approximate guides. It is hoped that the latter cases can be upgraded by future improved calculations. To monitor such activities as well as possibly to extent the scope to viscous solutions, the AGARD Fluid Dynamics Panel has established a Computational Fluid Dynamics Subcommittee. Author

**DESIGN CONSIDERATIONS FOR APPLICATION OF LAMINAR FLOW CONTROL SYSTEMS TO TRANSPORT AIRCRAFT**

A. L. BRASLOW and M. C. FISCHER *In* AGARD Aircraft Drag Prediction and Reduction 27 p Jul. 1985 refs

Avail: NTIS HC A12/MF A01 CSCL 01A

The current status of the laminar-flow control LFC technology is summarized. Factors that have previously inhibited the application of LFC are first reviewed. Involved are the effects of atmospheric ice crystals, surface irregularities, acoustical environment, and off-design operating conditions. Aircraft design trends that are different from turbulent aircraft are discussed as are various design requirements unique to the LFC systems. Current design approaches for the principal LFC systems are reviewed. These include the system for protection of the leading-edge region from surface contamination and icing and the system for removal of a portion of the boundary-layer air. The latter includes consideration of both multiple spanwise suction slots and distributed perforations and required differences between the wing-box and leading-edge box regions. Author

**RECENT DEVELOPMENTS IN THREE-DIMENSIONAL WAKE ANALYSIS**
J. E. HACKETT and A. SUGAVANAM *In* AGARD Aircraft Drag Prediction and Reduction 19 p Jul. 1985 refs
Avail: NTIS HC A12/MF A01

Significant advances in the determination of drag and its components (viscous, vortex, source, blockage, etc.) have been made in recent years. These were triggered by the reduction of the vortex drag integral to a wake integral by Maskell in the early 1970's. In 1979, Wu Hackett, and Lilley broadened the basis for Maskell's results and, in 1984, Hackett and Sugavanam devised methods which make it suitable for use in the near-wake of wind tunnel models. These advances are reviewed. A consistent derivation, starting from a simple form of the momentum equations, which include the best and least restrictive assumptions and procedures is provided. A practical example is discussed. Author

**PREDICTION OF THE DRAG OF WINGS AT SUBSONIC SPEEDS BY VISCOUS/INVISCID INTERACTION TECHNIQUES**
R. C. LOCK *In* AGARD Aircraft Drag Prediction and Reduction 71 p Jul. 1985 refs
Avail: NTIS HC A12/MF A01

Alternative ways of calculating the drag of an aerofoil or wing are discussed, and it is concluded that, at the present time, the far field approach is both more accurate and more informative. In this approach, the total drag is split into three components, wave (C sub D sub W), vortex (C sub D sub i) and viscous (C sub D sub V), and it is shown how simple methods for estimating these components can be derived. A brief account is given of the modern technique of viscous-inviscid interaction, concentrating on methods in which an accurate inviscid code is coupled with an integral method for calculating the viscous shear layers (boundary layer and wake). Recent advances are described which should improve the overall accuracy and allow more difficult cases, where boundary layer separation is present, to be treated successfully. Some methods of this type for aerofoils in two dimensions are summarized, and their accuracy assessed by comparison with experiment, including examples where flow separation takes place. Finally, an experiment on a particular wing-body combination, typical of a modern transport aircraft design, is chosen to show how an analysis of the drag can be performed by using the experimental pressure distribution as input to theoretical methods for calculating the separate wave, vortex and viscous components of drag. **TRANSONIC DRAG RISE AND DRAG REDUCTION BY ACTIVE/PASSIVE BOUNDARY LAYER CONTROL**
E. STANEWSKY and F. KROGMANN *In* AGARD Aircraft Drag Prediction and Reduction 41 p Jul. 1985 refs
Avail: NTIS HC A12/MF A01

Accurate drag prediction and efficient drag reduction are, particularly in the transonic speed range, paramount to the future of economical aircraft design and operation. The prediction of drag based on high-speed wind tunnel results are discussed with emphasis placed on problems associated with testing at transonic speeds and the transfer of low Reynolds number wind tunnel results to full-scale aircraft conditions. A more general consideration of the drag development associated with compressibility and viscosity and the viscous-inviscid interaction of the flow on an aerodynamic configuration is given. Drag reduction methods which are mainly based on active and passive boundary layer control by means of slots and perforated strips utilized to either draw material from and/or add material to the boundary layer are discussed. It may be concluded that present transonic drag predicton methods need further improvement, especially at off-design conditions; and that some of the approaches to boundary layer control considered may be quite efficient in increasing aircraft aerodynamic performance. **LIFTING SURFACE THEORY FOR A HELICOPTER ROTOR IN FORWARD FLIGHT**
H. TAI and H. L. RUNYAN *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 89-101 Nov. 1985 refs Previously announced as N85-10916
Avail: NTIS HC A21/MF A01

A lifting surface theory was developed for a helicopter rotor in forward flight for compressible and incompressible flow. The method utilizes the concept of the linearized acceleration potential and makes use of the vortex lattice procedure. Calculations demonstrating the application of the method are given in terms of the lift distribution on a single rotor, a two-bladed rotor, and a rotor with swept-forward and swept-back tips. In addition, the lift on a rotor which is vibrating in a pitching mode at 4/rev is given. Compressibility effects and interference effects for a two-bladed rotor are discussed. Author

**DEVELOPMENT OF AN UNSTEADY AERODYNAMICS MODEL TO IMPROVE CORRELATION OF COMPUTED BLADE STRESSES WITH TEST DATA**
S. T. GANGWANI *In* NASA. Ames Research Center Rotorcraft Dynamics 11984 p 103-116 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01A

A reliable rotor aeroelastic analysis operational that correctly predicts the vibration levels for a helicopter is utilized to test various unsteady aerodynamics models with the objective of improving the correlation between test and theory. This analysis called Rotor Aeroelastic Vibration (RAVIB) computer program is based on a frequency domain forced response analysis which utilizes the transfer matrix techniques to model helicopter/rotor dynamic systems of varying degrees of complexity. The results for the AH-1G helicopter rotor were compared with the flight test data during high speed operation and they indicated a reasonably good correlation for the beamwise and chordwise blade bending moments, but for torsional moments the correlation was poor. As a result, a new aerodynamics model based on unstalled synthesized data derived from the large amplitude oscillating airfoil experiments was developed and tested. Author

**AEROELASTIC CONSIDERATIONS FOR TORSIONALLY SOFT ROTORS**
W. R. MANTAY and W. T. YEAGER, JR. *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 117-136 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01A

A research study was initiated to systematically determine the impact of selected blade tip geometric parameters on conformable rotor performance and loads characteristics. The model articulated rotors included baseline and torsionally soft blades with interchangeable tips. Seven blade tip designs were evaluated on the baseline rotor and six tip designs were tested on the torsionally soft blades. The designs incorporated a systemmatic variation in geometric parameters including sweep, taper, and anhedral. The rotors were evaluated in the NASA Langley Transonic Dynamics Tunnel at several advance ratios, lift and propulsive force values, and tip Mach numbers. A track sensitivity study was also conducted at several advance ratios for both rotors. Based on the test results, tip parameter variations generated significant rotor performance and loads differences for both baseline and torsionally soft blades. Author

**A REVIEW OF DYNAMIC INFLOW AND ITS EFFECT ON EXPERIMENTAL CORRELATIONS**
G. H. GAONKAR and D. A. PETERS (Washington Univ., St. Louis, Mo.) *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 187-205 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01A

A review is given of the relationship between experimental data and the development of modern dynamic-inflow theory. Some of the most interesting data, first presented 10 years ago at the Dynamic Specialist's Meeting, is now reviewed in light of the newer theories. These pure blade-flapping data correlate very well with analyses that include the new dynamic inflow theory, thus verifying the theory. Experimental data are also presented for damping with coupled inplane and body motions. Although inclusion of dynamic inflow is often required to correlate this coupled data, the data cannot be used to verify any particular dynamic inflow theory due to the uncertainties in modeling the inplane degree of freedom. For verification, pure flapping is required. However, the coupled data do show that inflow is often important in such computations. Author

**DYNAMIC RESPONSE CHARACTERISTICS OF A CIRCULATION CONTROL ROTOR MODEL PNEUMATIC SYSTEM**
C. B. WATKINS, K. R. READER (Naval Ship Research and Development Center, Bethesda, Md.), and S. K. DUTTA *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 273-285 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01B

Numerical and experimental simulation of unsteady airflow through the control valve and slotted air duct of a circulation control rotor is described. The numerical analysis involves the solution of the quasi-one-dimensional compressible fluid-dynamic equations in the blade air duct together with the coupled isentropic flow equations for flow into the blade through the valve and out of the blade through the Coanda slot. Numerical solutions are compared with basic experimental results obtained for a mockup of a circulation control rotor and its pneumatic valving system. The pneumodynamic phenomena that were observed are discussed with particular emphasis on the characteristic system time lags associated with the response of the flow variables to transient and periodic control valve inputs. ## AIR TRANSPORTATION AND SAFETY

Includes passenger and cargo air transport operations; and aircraft accidents.

**A86-17063**
**LONG TAXI ROLLS CAN LEAD TO CATASTROPHIC BLOW-OUTS**
S. N. BOBO (DOT, Transportation Systems Center, Cambridge, MA) ICAO Bulletin, vol. 40, Oct. 1985, p. 34-37.

Airliner takeoff taxi run distances of more than 5.5 km lead to landing gear tire states at which, especially in the case of wide body aircraft, the tires begin to rapidly degrade. This increases the likelihood of blowouts, with catastrophic effects. Attention is given to tire temperature rise over long taxi rolls for various operational conditions, and to safety enhancement recommendations encompassing reductions of takeoff loads and taxi speeds. O.C.

**A86-17174**
**AIRLINE EFFICIENCY**
J. M. RAMSDEN Flight International (ISSN 0015-3710), vol. 128, Nov. 2, 1985, p. 32-36.

An attempt is made to accurately characterize the comparative efficiency of operations for a sample of 14 airlines whose schedules include both short and long range flights. The tabulations made of their performance range over such aspects of operation as average route length, departures per aircraft, departures per employee, output per employee, revenue rate and revenue per employee, passengers per employee, aircraft utilization, flying hours per employee, and overall cost levels. Total capacity tonne-km is employed as the ultimate measure of transport efficiency. O.C.

**A86-18406**
**FAA CERTIFICATION OF ROTORCRAFT ENGINE INDUCTION SYSTEM FOR ICE PROTECTION**
H. R. WHITLOCK (FAA, Aircraft Certification Div., Fort Worth, TX) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 8 p.

Attention is given to the methodology required for demonstration of compliance with Federal Aviation Regulations FAR 27.1093(b) and FAR 29.1093(b), which require that helicopter engine induction systems operate throughout the aircraft/engine design envelope without the accumulation of ice that might adversely effect engine operations. The present discussion notes the variety of engine air intakes for which these requirements must be met. Dry air tests, tanker and spray rig tests, icing tunnel tests, and natural icing tests, together with the type of flight data required and the instrumentation that furnishes it, are discussed. O.C.

**A86-18452**
**ANALYTICAL METHODS FOR LHX MISSION AND TASK ANALYSIS**
B. E. HAMILTON and H. P. HARPER (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 9 p.

Attention is given to a methodology by means of which the aircrew workload of a novel aircraft design can be predicted, on the basis of attentional demand and task times for up to three simultaneous tasks. The predictions, in terms of 'acceptable', 'marginal', or 'unacceptable' ratings, are amenable to empirical validation. As decisions are made on the basis of previously defined rules, changes in analyst understanding or work overload management philosophy can be readily implemented for subsequent validation. O.C.

**A86-18454**
**MANNED SIMULATION STUDIES OF AIRCREW WORKLOAD IN THE F-15 DUAL ROLE FIGHTER**
W. J. CODY (McDonnell Douglas Corp., St. Louis, MO) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 36 p.

A man-in-the-loop flight simulation program has been conducted in support of the F-15 Dual Role Fighter derivative, with a view to crew station configuration refinement and the demonstration of manageability in anticipated aircrew workloads for various mission scenarios. The results obtained in the first phase of the simulation program led to changes in the baseline hardware configuration, information displays, and operating procedures; these changes were then tested during a second phase. Crew workload was quantified in terms of predefined mission performance criteria, and was examined under both fully operational and degraded system conditions. O.C.

**INJURY PATTERN ANALYSIS OF HELICOPTER WIRE STRIKE ACCIDENTS (+GZ LOAD)**
W. D. FARR (U.S. Army, Brooke Army Medical Center, San Antonio, TX), C. J. RUEHLE, G. N. WAGNER (Armed Forces Institute of Pathology, Div. of Aerospace Pathology, Washington, DC), and D. M. POSEY (U.S. Army, Tripler Army Medical Center, HI) Aviation, Space, and Environmental Medicine (ISSN 0095-6562), vol. 56, Dec. 1985, p. 1216-1219. refs

Injury patterns in rotary wing aircraft wire strike accidents were reviewed to determine mechanisms of injury. It was found that U.S. Army Safety Center data showed that between January 1, 1974 and August 31, 1981 there were 167 wire strikes involving Army helicopters which resulted in 60 injuries and 34 fatalities. From December 13, 1978 to June 23, 1982, three types of rotary wing aircraft were in eight fatal accidents. These mishaps accounted for 28 casualities: 14 fatalities and 14 injuries. Aviators comprised 64.4 percent of the fatalities. Injury pattern analysis showed 100 percent had major head and neck injuries with 66 percent having basilar skull fractures. Two-thirds had associated mandibular fractures or evidence of impact forces transmitted through the mandible to the skull. The same number had wedge-shaped chin lacerations from impact with the cyclic control stick. Transmission of lethal impact forces primarily in the +Gz direction through the mandible to the skull is postulated. This suggests either improper use and/or failure of the seat and restraint systems. Author

**INFLUENCE OF THE DROPPING CONDITIONS ON CONTAINER MOTION NEAR THE CARRIER AND ON THE IMPACT PARAMETERS [WALYW WARUNKOW ZRZUTU NA RUCH ZASOBNIKA W POBLIZU NOSICIELA I PARAMETRY UPDADKU]**
J. MARYNIAK, K. MICHALEWICZ, and Z. WINCZURA (Warszawa, Politechnika, Warsaw, Poland) Mechanika Teoretyczna i Stosowana (ISSN 0079-3701), vol. 22, no. 3-4, 1984, p. 433-443. In Polish. refs

The features of flight of a container dropped from a subsonic aircraft were studied. Container dynamics at the dropping point as well as the influence of the initial conditions on the flight parameters near the impact point were evaluated. The container was considered as a rigid object having six degrees of freedom. Exemplary numerical calculations were performed. It was found that a small divergence from the assumed dropping conditions leads to the significant deviation of the impact point. Author

**FINITE ELEMENT ANALYSIS OF SOFT-BODY IMPACT Final Report, Sep. 1982 - Mar. 1984**
R. A. BROCKMAN Oct. 1984 106 p
(Contract F33615-82-K-3408)
(AD-A158436; UDR-TR-84-09; AFWAL-TR-84-3035) Avail: NTIS HC A06/MF A01 CSCL 20A

This report describes the development of analytical and numerical methods for determining the dynamic structural response caused by soft body impact. The prediction of stress and deflection behavior of aircraft transparencies due to collisions with birds is the primary area of application. When the structure is relatively flexible, such an impact involves strong coupling between the dynamic motion of the colliding bodies. The developed techniques use appropriate finite element methods in each region, together with a contact solution algorithm, to compute the coupled structural response, while the soft-body motions are integrated using a simpler explicit technique. The soft body dynamic analysis uses a Lagrangian description to track the free surface and impact region accurately, with an automatic rezoning procedure to correct large mesh distortions. GRA

(PB85-241198; GAO/RCED-85-157; B-219729) Avail: NTIS HC A08/MF A01 CSCL 01C

A compilation and analysis of data concerning the Federal Aviation Administration's (FAA's) inspection of 92 of the approximately 500 of the nation's scheduled commercial air carriers are given. These data are representative of FAA's inspections of about 350 air carriers during fiscal year 1984. This review was directed at FAA's responsibility under the Federal Aviation Act, as amended (49 U.S.C. 1421), to monitor and inspect air carrier operations and maintenance to assure compliance with federal safety regulations and FAA-approved air carrier policies and procedures. FAA's avionics, maintenance, and operations inspectors implement this responsibility by conducting inspections of air carrier personnel, aircraft, and maintenance and other facilities. Information is given on the type, frequency, and results of FAA's fiscal year 1984 air carrier inspections. GRA

**AIRCRAFT ACCIDENT REPORT: VIEQUES AIR LINK, INC., BRITTEN-NORMAN BN-21-6 ISLANDER, N589SA, VIEQUES, PUERTO RICO, AUGUST 2, 1984**
27 Sep. 1985 51 p
(PB85-901408; NTSB/AAR-85/08) Avail: NTIS HC A04/MF A01

About 0805 Atlantic standard time on August 2, 1984, Vieques Air Link, Inc., Flight 901A, a Britten-Norman BN-2A-6 Islander, crashed into the ocean shortly after takeoff from Vieques, Puerto Rico. Flight 901A was operated from Vieques, Puerto Rico, to St. Croix, U.S. Virgin Islands. The pilot and his eight passengers were killed, and the airplane was destroyed on impact with the water. The left engine lost power shortly after takeoff and the pilot lost control of the airplane. The National Transportation Safety Board determines that the probable cause of the accident was the failure of the pilot to execute the emergency engine-out procedure properly shortly after takeoff following a loss of power in the left engine due to water in the airplane's fuel system, and the failure of the Puerto Rico Ports Authority to remove excess water known to be in the airport's in-ground fuel tank before conducting fueling operations. The pilot's failure to execute the engine-out procedure properly was due to his inexperience in multi-engine airplanes. Contributing to the accident were: (1) the air carrier's use of a pilot not certified for the flight; (2) the air carrier's failure to train the pilot adequately; (3) the pilot's failure to follow proper practices to detect water in the airplane's fuel tanks; (4) the out of weight and balance condition of the airplane; (5) the Federal Aviation Administration's (FAA) incorrect application of 14 CFR Part 135 Rules to commuter air carriers; and (6) the FAA's generally inadequate surveillance of the air carrier. **THREE-AXIS ELECTROFLUIDIC ANGULAR RATE SENSOR FOR EJECTION SEAT STEERING THRUST VECTOR CONTROL Final Report**
V. NUYEN 2 Oct. 1984 166 p
(Contract F41-400; F41-451)
(AD-A159413; NADC-85053-60) Avail: NTIS HC A08/MF A01 CSCL 17G

Three-axis electrofluidic rate sensors were fabricated to NAVAIRDEVCEN specifications by the Hamilton Standard Division of United Technologies. Three units were delivered for test and evaluation. These units met or exceeded all but one of the performance goals specified for the maximum performance ejection system. This exception was a 119 millisecond (ms) ready time instead of the 100 ms goal. The other important performance characteristics include the linear range of + or -700 deg/sec, a transport delay at 5 ms, and the capability to operate during and after an ejection acceleration profile which peaked at 12.3 g. These units are suitable for use in the thrust vector control system of an advanced escape system. They are ready for system integration and full system performance testing. GRA

**THE DISTURBANCE OF AIRCRAFT NAVIGATION AND COMMUNICATION SYSTEMS BY ATMOSPHERIC STATIC ELECTRICITY [PERTURBATION DES SYSTEMES DE NAVIGATION ET DE COMMUNICATION DES AERONEFS PAR L'ELECTRICITE STATIQUE ATMOSPHERIQUE]**

H. BONGRAIN Navigation (Paris) (ISSN 0028-1530), vol. 33, Oct. 1985, p. 442-464. In French.

Storms produce static charges in the skin of aircraft and can degrade the performance of VOR and HF radio equipment. The associated discharges take place at frequencies of 10 kHz to 350 MHz range, precisely the range of VOR and HF functioning. The charging is caused by the contact of dust, snow crystals and particles with the skin of the aircraft, the movement of electrons into aircraft engines and then along conducting pathways, and the formation of an inductive field around the aircraft. The associated voltage levels have intensities from 2-10 mA. Electrical models are defined for equipotential and nonequipotential aircraft and a helicopter. Tests are described with a static discharger-generator which emits a unipolar charge into the atmosphere in response to signals from a voltmeter registering the appearance of a given charge level around the aircraft. The application of antistatic coatings such as pulverized carbon to the aircraft or radome skin to enhance the resistivity of the surface is also discussed. M.S.K.

**INTERFERENCE WITH AERONAUTICAL AIDS TO NAVIGATION (FREQUENCIES OF 108-118 MHZ) BY HIGH POWER FM RADIO BROADCASTS (88-108 MHZ) [BROUILLAGE DES AIDES AERONAUTIQUES /FREQUENCES 108-118 MHZ/ PAR LA RADIODIFUSION SONORE A MODULATION DE FREQUENCE /88-108 MHZ/]**

J.-M. LOSCOS (Direction Generale de l'Aviation Civile, Service Technique de la Navigation Aerienne, Paris, France) Navigation (Paris) (ISSN 0028-1530), vol. 33, Oct. 1985, p. 465-474. In French.

The upper end of the frequencies used for commercial FM radio broadcasts meets the lower end of the frequencies employed by VOR and ILS beacons. The FM signals can interfere with aircraft navaids by directly overlapping with the navaid signals because of parasitic signals emitted by the broadcasting equipment, or by inducing interference signals within the on-board receivers. An intermodulation model has been defined for the conditions under which the spectra of FM signals will produce interference in on-board receivers. Tests of ILS and VOR receivers exposed to FM emissions verified the model and underscored the necessity of either inserting a passband filter at the entrance to the receivers or raising the threshold signal power for reception. It is noted that certain medical, citizens band and satellite television networks also produce signal spectra which can excite interference signals within aircraft navaids receivers. M.S.K.

**THE MICROWAVE LANDING SYSTEM (MLS) [DAS MIKROWELLEN-LANDESYSTEM /MLS/]**

G. WESTPHAL (Interflug Gesellschaft fuer Internationalen Flugverkehr mbH, Berlin, East Germany) Technisch-Oekonomische Information der zivilen Luftfahrt (ISSN 0232-5012), vol. 21, no. 5, 1985, p. 183-187. In German.

The ILS (Instrument Landing System), which has been used in civil aviation since 1953, has provided effective and very reliable aid to pilots in aircraft landing operations. However, steadily increasing demands with respect to the accuracy level of the control signals have now led to a situation in which a new landing system is needed to meet the requirements. After comprehensive tests involving various types of MLS, the ICAO has recommended the introduction of the Time Reference Scanning Beam (TRSB) system. The TRSB system is discussed, taking into account the basic concept of operation, the ground segment, a functional description, Precision Distance Measuring Equipment (PDME) of the TRSB, MLS onboard equipment, and the advantages and drawbacks of the MLS. Aspects concerning the introduction of the MLS in civil aviation are also considered. G.R.

**A FAULT TOLERANT SYSTEM FOR AN INTEGRATED AVIONICS SENSOR CONFIGURATION Final Report**

A. K. CAGLAYAN and R. E. LANCRAFT Sep. 1984 191 p refs

(Contract NAS1-16579)

(NASA-CR-3834; NAS 1.26:3834; BBN-5352) Avail: NTIS HC A09/MF A01 CSCL 01D

An aircraft sensor fault tolerant system methodology for the Transport Systems Research Vehicle in a Microwave Landing System (MLS) environment is described. The fault tolerant system provides reliable estimates in the presence of possible failures both in ground-based navigation aids, and in on-board flight control and inertial sensors. Sensor failures are identified by utilizing the analytic relationships between the various sensors arising from the aircraft point mass equations of motion. The estimation and failure detection performance of the software implementation (called FINDS) of the developed system was analyzed on a nonlinear digital simulation of the research aircraft. Simulation results showing the detection performance of FINDS, using a dual redundant sensor compliment, are presented for bias, hardover, null, ramp, increased noise and scale factor failures. In general, the results show that FINDS can distinguish between normal operating sensor errors and failures while providing an excellent detection speed for bias failures in the MLS, indicated airspeed, attitude and radar altimeter sensors. **MODELLING FOR FATIGUE CRACK GROWTH PREDICTION IN AIRCRAFT**
J. M. FINNEY (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia) Fatigue and Fracture of Engineering Materials and Structures (ISSN 8756-758X), vol. 8, no. 3, 1985, p. 205-222. refs

Four fatigue crack growth (CG) models were examined for usefulness in predicting CG (in a fuselage frame of Mirage IIIO aircraft): the Wheeler (1972), the Willenborg (Willenborg et al., 1971), a modified Willenborg, and the Crack Closure (Bell and Creager, 1974; Bell and Wolfman, 1976) models. The CG rate analyses were compared with experimental data obtained on two regions of the aircraft frame. The Wheeler and the modified Willenborg retardation models were found to be the most satisfactory; however, both have shortcomings in that they require calibration by test and do not give accurate predictions (to better than a factor of 2 and, in some cases, of as much as 10) when specimen geometry and the test sequence are varied from those used in calibration tests. The main sources of inaccuracy are the inadequacy of the CG rate basic data, incorrect assumptions of crack shape, and uncertainty in stress history. Sample specifications and data graphs are included. I.S.

**ENGINE-OUT TAKE-OFF CLIMB - AN OLD AIRWORTHINESS PROBLEM REVIEWED**
R. NARASIMHA and M. R. ANANTHASAYANAM (Indian Institute of Science, Bangalore, India) ICAO Bulletin, vol. 40, Oct. 1985, p. 18-21.

A development history is presented for the technological and operational measures by which the engine-out (partial power) flight condition can be dealt with during the critical takeoff climb flight regime. Attention is given to the effects of aircraft fleet operational procedures on safety levels, and the progressive improvement of engine reliability over the 1950-1980 period. Control systems are recommended which increase the thrust of surviving engines substantially and manage aircraft maneuvers so that aircraft performance deviations from the norm (and pilot response) are no longer significant safety factors. O.C.

**METHODS FOR ROTOR AERODYNAMIC AND DYNAMIC ANALYSIS**
R. H. MILLER (MIT, Cambridge, MA) Progress in Aerospace Sciences (ISSN 0376-0421), vol. 22, no. 2, 1985, p. 113-160. refs

The complex problems associated with the aerodynamics of blade/vortex interactions, the dynamics of a blade displaced out of its plane of rotation, and the position control of a hovering helicopter are discussed. Simplified models help to describe, and appear to be adequate for analyzing, many aspects of these problems. Free wake analyses are shown to be of importance in determining blade loads and performance for hovering flight or for wind turbines. Unsteady aerodynamics and careful definition of the wake formation are required when computing vibratory airloads in forward flight. Author

**MODAL CONSTRAINTS ON STRUCTURAL DYNAMIC FORCE DETERMINATION**
J. A. FABUNMI (Maryland, University, College Park) American Helicopter Society, Journal (ISSN 0002-8711), vol. 30, Oct. 1985, p. 48-54. Army-supported research. refs

A numerical study was conducted to illustrate some factors which can affect the accuracy and effectiveness of helicopter dynamic force determination technology. These factors are related to the number and significance of the independent orthonormal modes participating in the helicopter response at the frequency of interest, compared to the number of independent forces being determined. The results show a strong correlation between the significance of the N(F)th mode and the error in the force determination procedure. It is concluded that the accuracy of dynamic force determination technology can be enhanced by insuring that the orthonormal modes which participate significantly in the response at a given frequency outnumber the independent forces that are being determined. C.D.

**28 YEARS OF FLIGHT TESTING HELICOPTERS**
J. BOULET Aerospace (UK) (ISSN 0305-0831), vol. 12, Nov. 1985, p. 17-22.

An autobiographical account is given of the helicopter flight testing experiences of Jean Boulet. Attention is given to the developmental testing of the Alouette I, II, and III helicopters in the 1950s, as well as to the effect of gradual technological refinement in the Super Frelon (1963), Puma (1965), Gazelle (1967), Lama (1969), Dauphin 360 (1972), Ecureuil (1974), and Dauphin 365C (1975). The consequences for helicopter safety of these technological developments are assessed. O.C.

**A86-17382**
**DESIGN AGAINST CORROSION**
G. B. EVANS (Workshop on Corrosion - In Service and Its Impact on Operations, Farnborough, England, Mar. 1985) Aerospace (UK) (ISSN 0305-0831), vol. 12, Nov. 1985, p. 23-28, 31-34.

The sources of material corrosion in aircraft structures are identified, and means by which they may be suppressed or precluded in the course of design development are evaluated. Attention is given to the environment in which the aircraft being contemplated will operate, the choice of materials for its critical structural elements, novel low corrosion metallic materials for airframe use, the influence of sharp edges, fuel tanks and mechanical fasteners, the electrical potential that can give rise to corrosion at mechanical joints employing several dissimilar metals, and external protection measures. O.C.

**TESTING TIME FOR AMX - THE CLOSE SUPPORT SPECIALIST MOVES TOWARDS PRODUCTION**
B. WANSTALL Interavia (ISSN 0020-5168), vol. 40, Nov. 1985, p. 1223-1225.

Four prototypes of the Italian/Brazilian 'AMX' attack aircraft are currently undergoing integrated flight testing in anticipation of an initial production run that will satisfy Italian and Brazilian Air Force orders of 187 and 79 aircraft, respectively. Although export marketing efforts are already underway, deliveries could not be made before 1989. Attention is presently given to the AMX's status as a weapons platform, as well as to the performance of the 5000-kg-thrust Spey Mk 807 turbofan engine. Two-seat and naval warfare versions of the AMX are under consideration. O.C.

**A86-17522**
**THE FIGHTER. II**
M. SPICK Air International (ISSN 0306-5634), vol. 29, July 1985, p. 24-31.

A development history is presented for interceptor fighter design from the end of the Korean War to the early 1960's, with attention to the course of debates among designers concerning the comparative advantages of cannon, unguided rocket, and guided missile weapons. Emphasis is given to the often highly innovative propulsion system design experiments conducted in the U.S., Britain and France during this period, which witnessed turbojet/ramjet and turbojet/rocket hybrid propulsion systems. Great stress was laid on high altitude, greater-than-Mach 2 speeds for the interception of supersonic, nuclear-armed strategic bombers. O.C.

**A86-17523**
**THE FIGHTER. III**
M. SPICK Air International (ISSN 0306-5634), vol. 29, Sept. 1985, p. 129-136.

A discussion is conducted on the comparative advantages projected by military aircraft designers since the 1960s for missile-armed and cannon-armed fighters, in light of such combat experiences as those afforded by the India-Pakistan wars of 1965 and 1971 and the Arab-Israeli wars of 1967, 1969-1970, and 1973. Attention is given to the ways in which the lessons thus learned were embodied in more recent fighter aircraft designs and armaments suites; tradeoffs are probed not only between missiles and cannon, but between shorter range IR-homing and longer range radar-homing missiles. O.C.

**A86-17525**
**2001 PHANTOM ODYSSEY**
M. SPICK Air International (ISSN 0306-5634), vol. 29, Dec. 1985, p. 287-292.

An evaluation is conducted of the modifications that have been made in the basic F-4 Phantom design since its introduction in U.S. Air Force and Navy service, in order to improve its overall performance and specialized mission capabilities. Attention is then given to experimental modification programs that have substantially altered some aspect of the basic configuration, such as canard control surfaces, as well as to prospective performance improvements that may accure to the use of lighter, more powerful state-of-the-art powerplants in place of the long-standard J-79 turbojets. Avionics and weapons suite reformulations are also under consideration, both in the U.S. and Israel. O.C.

**CHARACTERISTICS OF THE DESIGN OF VTOL JET AIRCRAFT [OSOBENNOSTI PROEKTIROVANIIA REAKTIVNYKH SAMOLETOV VERTIKAL'NOGO VZLETA I POSADKI]**
V. V. VOLODIN, N. K. LISEITSEV, and V. Z. MAKSIMOVICH Moscow, Izdatel'stvo Mashinostroenie, 1985, 224 p. In Russian. refs

The problems encountered at various stages of the design of VTOL jet aircraft are examined. In particular, attention is given to the calculation of forces and moments acting on VTOL aircraft during vertical takeoff and landing; modeling and analysis of aircraft control during vertical takeoff and landing; functional requirements for the control systems of VTOL aircraft and their design; and the design of the airframe and power plants of VTOL jet aircraft. The discussion also covers the calculations of the weight characteristics of VTOL aircraft, computer-aided design of general VTOL aircraft configurations, and an assessment of the efficiency of VTOL jet aircraft. V.L.

**RESPONSE OF A ROTORCRAFT MODEL WITH DAMPING NON-LINEARITIES**
B. H. TONGUE (Georgia Institute of Technology, Atlanta) Journal of Sound and Vibration (ISSN 0022-460X), vol. 103, Nov. 22, 1985, p. 211-224. refs

The linearized equations of motions of a helicopter in a contact with the ground have solutions which can be linearly stable or unstable, depending on the system parameters. The present study includes physical non-linearities in the helicopter model. This allows one to determine if a steady-state response exists and, if so, what the frequency and amplitude of the oscillations will be. In this way, one can determine how serious the linearly unstable operating regime is and whether destructive oscillations are possible when the system is in the linearly stable regime. The present analysis applies to helicopters having fully articulated rotors. Author

**NONPLANAR, SUBSONIC, THREE-DIMENSIONAL OSCILLATORY PIECEWISE CONTINUOUS KERNEL FUNCTION METHOD**
I. LOTTATI and E. NISSIM (Technion - Israel Institute of Technology, Haifa, Israel) Journal of Aircraft (ISSN 0021-8669), vol. 22, Dec. 1985, p. 1043-1048. refs

The rapid convergence characteristics and high accuracy of the three-dimensional piecewise continuous kernel function method are tested on a nonplanar configuration. The nature of the singularity of the three-dimensional kernel function for the nonplanar configuration is examined and anomalies associated with almost adjoining lifting surfaces are explained. Applications are made using the standard AGARD wing-tail configuration and the interference aerodynamic forces are compared with results obtained using other numerical methods. Author

**NATIONAL SPECIALISTS' MEETING ON HELICOPTER TESTING TECHNOLOGY, WILLIAMSBURG, VA, OCTOBER 29-NOVEMBER 1, 1984, PROCEEDINGS**

Meeting sponsored by AHS. Alexandria, VA, American Helicopter Society, 1984, 319 p. For individual items see A86-18402 to A86-18429.

The present conference considers aeroelastic model helicopter rotor testing methods, developmental test techniques for composite helicopter airframes, drivestrain simulation requirements for helicopter clutch development, helicopter/ship dynamic interface flight testing, Kevlar filament-wound composite structure applications in helicopters, the certification of helicopter engine inlet ice protection systems, flight data analysis/storage systems, a pneumatic deicing system for helicopter rotors, and bench testing of helicopter drive systems. Also considered are wire strike protection systems, maintainability demonstration for U.S. Army helicopters, the NASA Langley 4 x 7-m rotorcraft wind tunnel, accelerated optimization and certification testing for helicopter deicing systems, integrated helicopter system testing, reliability and maintainability test data management for helicopter development, LHX helicopter simulation methods, avionics system integrated testing techniques, helicopter testing for the air-to-air combat role, and the testing of large helicopter transmissions. O.C.

**A86-18402*** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.

**AEROELASTIC MODEL HELICOPTER ROTOR TESTING IN THE LANGLEY TDT**

W. R. MANTAY, W. T. YEAGER, JR., M.-N. H. HAMOUDA, R. G. CRAMER, JR., and C. W. LANGSTON (NASA, Langley Research Center; U.S. Army, Structures Laboratory, Hampton, VA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 18 p. Previously announced in STAR as N86-11523. refs

Wind-tunel testing of a properly scaled aeroelastic model helicopter rotor is considered a necessary phase in the design development of new or existing rotor systems. For this reason, extensive testing of aeroelastically scaled model rotors is done in the Transonic Dynamics Tunnel (TDT) located at the NASA Langley Research Center. A unique capability of this facility, which enables proper dynamic scaling, is the use of Freon as a test medium. A description of the TDT and a discussion of the benefits of using Freon as a test medium are presented. A description of the model test bed used, the Aeroelastic Rotor Experimental System (ARES), is also provided and examples of recent rotor tests are cited to illustrate the advantages and capabilities of aeroelastic model rotor testing in the TDT. The importance of proper dynamic scaling in identifying and solving rotorcraft aeroelastic problems, and the importance of aeroelastic testing of model rotor systems in the design of advanced rotor systems are demonstrated. Author

**A86-18403**

**DEVELOPMENTAL TESTING FOR COMPOSITE FRAMES**

J. LACY and E. DURCHLAUB (Boeing Vertol Co., Philadelphia, PA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 8 p.

Interlaminar shear stresses, and cap stresses that are due to curvature and to the use of bonded, rather than riveted connections between cap and web materials, are unique composite aircraft structural design concerns without precedents in metallic structural experience. A developmental testing program has accordingly been instituted as an essential element of the composite helicopter primary structure design process. Attention is presently given to the test sequence and to the results obtained for the case of all-composite ring frames of the Model 360 Advanced Techcnology Helicopter. Design confirmation has been achieved with simple test procedures, using coupons, frame section specimens, and entire airframes. O.C.

**A86-18404**

**DEVELOPMENT TESTING OF THE H-60 COMPOSITE MAIN ROTOR BLADE**

J. KIERAS and F. HERNANDEZ (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 20-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 8 p.

Attention is given to the efforts undertaken by a manufacturing methods and technology program for the development of an H-60 helicopter composite rotor blade, replacing current titanium-spar blades. Although the evaluation testing that must precede determination of a production blade configuration has not been completed, the prototype composite blade has demonstrated titanium blade-equivalent fatigue strength, as well as damage tolerance levels far above those of the metallic structure. Tests have also revealed that torsional stiffness and mass distribution should be tuned in the final blade configuration to match those of the titanium-spar blade. O.C.

**A86-18405**

**DYNAMIC INTERFACE - CONVENTIONAL FLIGHT TESTING PLUS A NEW ANALYTICAL APPROACH**

D. CARICO and S. L. MADEY, JR. (U.S. Navy, Naval Air Test Center, Patuxent River, MD) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 7 p. refs

Dynamic interface flight test programs have been instituted to achieve maximum operational capability and safety in helicopter shipboard landings; although much progress has been made, there remain many helicopter/ship-type combinations to be tested. Attention is presently given to a novel approach to the dynamic interface problem which emphasizes accelerated conventional testing in the near term and the development of an analytical capability for shipboard landings in the long term. This analytical capability calls for the development of shipboard landing data bases, as well as improvements in landing simulation. The goal is to be able to substitute a major portion of the conventional flight test effort with simulation and analysis techniques. O.C.

**A86-18408**

**FLIGHT TESTS OF THE HELICOPTER PNEUMATIC DEICING SYSTEM**

L. A. HAWORTH and M. S. GRAHAM (U.S. Army Aviation Engineering Flight Activity, Edwards AFB, CA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 9 p. refs

The flight tests conducted since 1980 to ascertain the capabilities of a prototype pneumatic deicing system for helicopter rotors, using a UH-1H helicopter test bed, have encompassed a structural loads survey, performance and handling qualities tests, rain erosion testing, and artificial and icing test performance evaluations. While the original prototype system led to significant aircraft performance degradation and minor effects on handling qualities, modifications to the prototype that were instituted in 1983 have yielded improved performance. Satisfactory deicing capabilities have been obtained in both artificial and natural icing conditions. O.C.

**A86-18411**

**HELICOPTER WIRE STRIKE PROTECTION SYSTEM QUALIFICATION TESTING**

L. T. BURROWS (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 10 p.

The Wire Strike Protection System (WSPS) whose qualification testing has recently been conducted consists of deflectors and cutters, and furnishes helicopters with significant protection from damage due to taut wire strikes in low level flight. The full scale

WSPS testing technique was formulated to assess the system's capabilities and limitations, structural integrity, and potential effects on the helicopter airframe during the wire impact/deflection/cutting sequence. This qualification test regime has been applied to OH-58A, UH-1H, AH-1S, OH-6A, and UH-60A military helicopters equipped with WSPS. O.C.

**A86-18416**

### NEW TECHNIQUES FOR OPTIMIZATION AND CERTIFICATION OF HELICOPTERS IN ICING CONDITIONS

P. J. DUNFORD (Boeing Vertol Co., Philadelphia, PA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 30 p.

An accelerated two-year development/certification test program was undertaken to furnish the RAF's Chinook helicopters with all-weather operational capability; this involved the incorporation of a heated rotor blade deicing system. Attention is given to the development of a system combining flexible deicing control with real time data analysis techniques for on-board decision-making. Increased test flight productivity and accelerated development were obtained by this means. Detailed postflight analyses by a ground station were, however, essential to overall success. O.C.

**A86-18418**

### OPERATIONAL TESTING EXPERIENCE ON THE AH-64A APACHE

R. D. WATSON (McDonnell Douglas Corp., Hughes Helicopters, Inc., Culver City, CA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 10 p.

A process of laboratory integration, vehicle ground integration testing, and flight evaluation, in which design changes were 'iteratively' incorporated after a given testing stage, was conducted for the Apache military helicopter's weapon system. Software development was expedited during the test phase to furnish fast, yet controlled turn-around of software updates. The system provided complete updates as well as field patches, and an identification system that provided configuration control and correlation with flight test results. Integration emphasis was placed on the MIL-STD-1533A multiplex bus system. O.C.

**A86-18419**

### R&M TEST DATA MANAGEMENT DURING HELICOPTER SYSTEM DEVELOPMENT

K. H. EAGLE and G. WINDOLPH (Boeing Vertol Co., Philadelphia, PA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 6 p.

The primary objective of helicopter testing from the reliability and maintainability (R&M) viewpoint is the identification of as-yet unknown failure modes and the quantification of failure rates for known ones. Attention is presently given to the case of the CH-46 helicopter's R&M program, whose test data collection and data analysis program involved the logging and tracking of each failure event. On the basis of the occurrence frequency and criticality of a given event, responses ranging from continued monitoring during testing to full design change corrective action are formulated. Documentation is furnished for each such decision. O.C.

**A86-18420**

### RELIABILITY DEVELOPMENT TESTING OF SH-60B HELICOPTER MECHANICAL SYSTEMS

R. L. HOLT and G. A. NEYSSEN (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 15 p.

Testing techniques aimed toward the development of reliability of helicopter mechanical components are illustrated for the case of the SH-60B's systems for Recovery Assist, Securing and Traversing, rotor bladefolding, rotor brake, and sonobuoy launching. These tests were designed to simulate 5000 hours of repeated aircraft operational cycles, in critical environmental conditions which encompassed sand and dust, salt spray, high temperature and humidity, icing, and vibration. System components, relative component locations, and connecting hardware were duplicated for evaluation of possible interaction effects. O.C.

**A86-18421**

### THE ROLE OF SIMULATION FOR THE LHX

T. R. METZLER (U.S. Army, Aviation Systems Command, St. Louis, MO) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 7 p.

The use of full existing capabilities for simulation of the range of combat helicopter operational conditions and behavior, from aerodynamics to tactical performance, are expected to yield significant advantages in the design of major 'LHX' helicopter elements. Simulation has been rendered critical by a compressed and accelerated development program, crew size reductions, and complex integrations of advanced technologies. The state-of-the-art simulation technology in question is software-intensive, and is therefore substantially more independent of electromechanical systems than past simulation technologies. O.C.

**A86-18422**

### SIMULATING THE TOTAL SYSTEM, WARTS AND ALL

P. B. BRIGHAM (Martin Marietta Corp., Orlando, FL) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 8 p.

Extensive use will be made of simulation to validate automation concepts during the development of the U.S. Army's next-generation 'LHX' helicopter. In the scout/attack role, the LHX will be operated by a single crewman and must therefore rely on an unprecedented degree of onboard-systems automation. Attention is presently given to the method that will be used to model automatic sensor recognition and sensor fusion functions with a degree of fidelity that can realistically support evaluations of the effects of false alarms, incorrect target classifications, and missed targets (in the presence of targets and target-like clutter elements) in man-in-the-loop mission simulations. O.C.

**A86-18424**

### TESTING HELICOPTERS FOR THE AIR-TO-AIR COMBAT ROLE

J. J. MCCUE, L. E. SCOTT, and J. G. CASLER (U.S. Navy, Naval Test Pilot School, Patuxent River, MD) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 32 p. refs

Attention is given to a methodology suitable for the simulation of helicopter-vs.-helicopter air-to-air combat, taking into account the adoption of evasive maneuvering as an essential element of mission capabilities for combat helicopters of the LHX/PAM-2/A-129 class. The highly agile, rigid rotor BK 117 and Hughes 530 helicopters are the subjects of planned air combat tests, which will generate a data base that can be used by helicopter designers, weapons specialists, and helicopter tacticians as the basis of evasive maneuvering capability improvements in future systems. O.C.

**A86-18427**

**U.S. ARMY/SIKORSKY ACAP AIRFRAME TEST TECHNIQUES/METHODOLOGY**

H. L. KEARNEY (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) and D. GOOD (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 14 p.

Special considerations and test techniques used during static testing of the U.S. Army/Sikorsky Advanced Composite Airframe Program (ACAP) airframe are discussed. Included are considerations for accountability for effects of prolonged environmental exposure on composite material strength, and establishment of limit and ultimate load criteria. Techniques used for damage detection and inspection, and the problems and solutions associated with repairing bonded composite structures damaged during test conduct are described. Author

**A86-18428*** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.

**VERIFICATION OF STATIC ROTOR-LOAD MEASUREMENT CAPABILITIES OF THE RSRA HELICOPTER ACTIVE-ISOLATOR SYSTEM**

C. W. ACREE, JR. (NASA, Ames Research Center, Moffett Field, CA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 15 p.

The Rotor Systems Research Aircraft helicopter technology demonstration test bed incorporates an active isolator system which reduces the rotor vibrations that are transmitted to the airframe and allows the simultaneous measurement of all six forces and moments generated by the rotor. The first full system calibration was performed in 1983 to verify the system's static load measurement capabilities; the analysis of the data encompassed multiple linear regressions to determine calibration matrices for different data sets, and a hysteresis removal algorithm for the estimation of in-flight measurement errors. The results obtained indicate that the active isolator system meets most performance predictions. O.C.

**A86-18443**

**THE AV-8B FATIGUE TEST PROGRAM**

N. D. NEWMAN (McDonnell Aircraft Co., St. Louis, MO) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 14-0 to 14-27.

A structural fatigue test program was conducted over 1982-1984 as part of the AV-8B Full Scale Development Program which encompassed a full scale airframe fatigue test and auxiliary fatigue tests of both metallic and composite structural components. The 12,000 hours of severe airframe use thus simulated were equivalent to two service lifetimes. Attention is given to the AV-8B's fatigue design philosophy, load spectra, fatigue test methods, and test results, with attention to problem resolution. O.C.

**A86-18444**

**SH-2F AIRFRAME FATIGUE TEST PLAN**

W. F. ALEX (Kaman Aerospace Corp., Bloomfield, CT) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 15-1 to 15-15.

Since the U.S. Navy intends to operate the SH-2F helicopter in service past the year 2000, they have presented a contract to Kaman Aerospace Corporation requesting a plan for a fatigue test of a full-scale SH-2F fuselage with the objective of substantiating a 20,000 hour service life for the airframe. Kaman is presently in the preliminary stage of organizing this plan. This paper summarizes the results of past fatigue tests involved with the H-2 fuselage. It also described the basic of the load-time spectrum to be employed in the new test, the form and types of test loads to be applied to simulate flight loads excursions, and the methods to be used to apply and control the test loads. In addition, it discusses the manner in which the test will be conducted in order that the results may be logically interpreted to determine the inspection intervals and possible periodic modifications, or repairs, that may be necessary to achieve the required service life. Author

**A86-18445**

**HELICOPTER FATIGUE - THE CHANGING SCENE**

J. W. BRISTOW (Civil Aviation Authority, Airworthiness Div., Redhill, England) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 17-1 to 17-16.

The British Civil Aviation Authority Airworthiness Division became increasingly aware, over the 1980-1984 period, that the safety record of fatigue-related helicopter failures could be enhanced. Attention is presently given to steps being taken with this end in mind, which encompass the reassessment of manufacturers' fatigue substantiation testing methods, the monitoring of the effects of corrosion, deterioration and wear by both operators and manufacturers, and the specification of the validity of any declared service life in terms of flight profile or spectrum. In the absence of fail safe/damage tolerance features, the requirements should provide for substantially higher strength reduction factors. O.C.

**A86-18446**

**DAMAGE TOLERANCE ANALYSIS OF COMPONENTS OF ROTOR WING AIRCRAFT**

R. BOORIA (Bell Helicopter Textron, Fort Worth, TX) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 18-1 to 18-31. refs

The feasibility of applying the specifications of MIL-STD-1530A to dynamic components of tilt rotor aircraft was investigated by analyzing a representative sample of components from three significant functional areas of the XV-15 aircraft. The yoke from the hub assembly, the rotating ring from the controls system and the mast from the drive system were the three components chosen. These components reflect diversity in material (excluding composites) as well as different combinations of mean and oscillatory load levels. The weight penalty estimates were made by comparing the weight of the damage tolerant configuration with that of a 10,000 hour safe-life configuration. The initial flaw sizes were 0.015 x 0.030 for surface flaws and 0.015 x 0.015 for cracks emanating from holes and corners. Of the three components analyzed, only the yoke has incurred a weight penalty. The rotating ring and mast were shown to be damage tolerant in their current design configurations. Author

**THE APPLICATION OF FATIGUE DAMAGE TOLERANCE CONCEPTS TO HELICOPTERS - THE APPROACH PROPOSED BY THE UK MILITARY AIRWORTHINESS AUTHORITIES**

A. CARDRICK, R. MAXWELL, and S. MORROW (Royal Aircraft Establishment, Airworthiness Div., Farnboroush, England) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 19-1 to 19-38. refs

The principles governing fatigue damage tolerance that have been proposed by the British military airworthiness authorities for helicopters give attention to tolerance to unforseen high stresses, and reduce sensitivity to defects arising during both manufacturing and service. A comparison is presently conducted between the implications of sizing principal structural feature types to this novel approach, and to an alternative strategy (introduced by the USAF and currently under consideration by the FAA) which is based on abnormal defects. Calculations employing the safe life approach furnish a benchmark for this comparison; it is shown that the choice of strategy can have a substantial influence on allowable stresses. O.C.

### DAMAGE TOLERANCE AND CIVIL HELICOPTER DESIGN

R. T. WEAVER (FAA, Fort Worth, TX) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 20-1 to 20-22. refs

As damage tolerance design approaches and substantiation methods gain in application and practicality, efforts to apply these approaches to civil helicopter design are being made. Helicopters, because of their load environment, would profit even more than airplanes from damage tolerance design features but because of their mechanical and structural complexity, helicopters are more difficult to be made damage tolerant. Accordingly, the FAA has generated a program to add damage tolerance to the civil transport helicopter regulations. The FAA program to add damage tolerance requirements to the civil helicopter regulations is designed to encourage the use of mature damage tolerance technology and the development of additional design features and methodologies. The application of multiple load path features as well as fracture mechanics methodologies is encouraged to achieve the goals of this program which are to save lives and otherwise increase safety. ### DAMAGE TOLERANCE ANALYSIS OF THE H-53 HELICOPTER

J. W. LEWIS, JR. (USAF, Warner Robins Air Logistics Center, Robins AFB, GA), G. J. SCHNEIDER, and J. L. PRATT (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 21-1 to 21-21.

Sikorsky Aircraft is currently conducting a damage tolerance assessment (DTA) of the H-53 helicopter. This task provides an opportunity to evaluate the concept, requirements and analytical techniques of damage tolerance analysis as applied to rotary wing aircraft. The DTA effort is a three-phase program consisting of: (1) identification and screening of critical locations, (2) development of an interactive computer program (runstream) for crack growth analysis, and (3) crack growth analysis and determination of force management actions. Sikorsky is now approaching the end of the second phase. This paper is an overview of the accomplished and planned work as well as problems encountered. Author

### TOMORROW'S COCKPIT TECHNOLOGY IN TODAY'S MODERN HELICOPTER

W. P. REA (Hughes Helicopters, Inc., Culver City, CA) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 8 p.

The new 530 MG Defender is a light weight, multirole combat helicopter which makes maximum use of the integrated cockpit concept. Compact, swift and agile, the 530 MG Defender is engineered to provide broad mission flexibility through the use of a modular, quick change weapon system and a control avionics management system with a flexible interface. The cockpit is designed to centralize primary flight information displays and controls for maximum crew visibility in day and night nap-of-the-earth flight. The heart of the cockpit is the Integrated Control and Display System which utilizes a mission computer, multifunction display, control display unit, symbol generator, and a mission data transfer devcie. All are linked by a MIL-STD-1553 multiplex data bus, which easily accommodates system growth on a plug-in basis. The copilot has a stowable Virtual Image Display (VID) to view the TOW antitank missile's mast-mounted sight video for either reconnaissance, target tracking or TOW guidance. The VID can also be used for nighttime reconnaissance in conjunction with the nose-mounted forward-looking IR system. Author

### AEROELASTICITY AND DYNAMICS OF THE HELICOPTER STRUCTURE [AEROUPRUGOST' I DINAMIKA KONSTRUKTSII VERTOLETA]

O. P. BAKHOV Moscow, Izdatel'stvo Mashinostroenie, 1985, 176 p. In Russian. refs

Methods for calculating and selecting helicopter parameters with allowance for the dynamics of the helicopter structure are presented. In particular, attention is given to the analysis of the self-oscillations of rotors mounted on an elastic structure, selection of stiffness and weight characteristics, and methods for the design optimization of the structures of heavy twin-rotor helicopters of transverse arrangement and tail rotors. Methods of experimental studies of helicopters and dynamically similar models are also examined. V.L.

### THE OXYGEN EQUIPMENT OF PASSENGER AIRCRAFT [KISLORODNOE OBORUDOVANIE PASSAZHIRSKIKH SAMOLETOV]

E. M. PESHKOV, V. B. CHERTOK, and V. L. CHUGUNOV Moscow, Izdatel'stvo Transport, 1985, 144 p. In Russian. refs

The effect of various factors on the human body under conditions of reduced pressure is reviewed, and the life support systems of passenger aircraft are briefly characterized. In particular, attention is given to the design and principles of operation of oxygen-supply systems for the crew and the passengers. The discussion covers stationary and portable oxygen systems, the efficiency of passenger oxygen systems, and guidelines for using oxygen equipment. Finally, the maintenance of oxygen systems and their evaluation and inspection are discussed. V.L.

### INFLUENCE OF ROUGH RUNWAYS ON UNDERCARRIAGE DESIGN

G. H. HAINES (Dowty Rotol, Ltd., Gloucester, England) Aircraft Engineering (ISSN 0002-2667), vol. 57. Nov. 1985, p. 2-8.

An examination is presented of those aspects of aircraft landing gear design that are pertinent to rough ground operation capability, in view of such quantifiable factors as discrete roughness of ground, deterministic runway profiles, and statistically defined runway profiles. Attention is given to the consequences of shock absorber and tire characteristics, and to the effect of higher shock absorber reaction levels on undercarriage design. The inherent limitations to what can be achieved through shock absorber damping and spring curve changes are noted. O.C.

### AIRCRAFT RELIABILITY, SAFETY, AND LIFETIME [NADEZHNOST', BEZOPASNOST' I ZHIVUCHEST' SAMOLETA]

L. L. ANTSELIOVICH Moscow, Izdatel'stvo Mashinostroenie, 1985, 296 p. In Russian. refs

The principal design factors affecting the reliability and lifetime of aircraft are considered. Theoretical reliability issues in the design of military and commercial aircraft are discussed, with emphasis given to: the concept of failure as a random event; the distribution of discrete random values for the probability of failure; and the properties of reliability indices. Numerical techniques for predicting times to failure in various types of aircraft are described. Some practical techniques for enhancing aircraft lifetime are also discussed, including: periodic reliability testing of aircraft parts; preflight and post-flight inspections; and basic aircraft repairs. **DETERMINATION OF CORRECTIONS TO FLOW DIRECTION SENSOR MEASUREMENTS OVER AN ANGLE-OF-ATTACK RANGE FROM 0 DEGREE TO 85 DEGREES M.S. Thesis - George Washington Univ., August 1983**
T. M. MOUL Dec. 1985 52 p refs
(NASA-TM-86402; L-15759; NAS 1.15:86402) Avail: NTIS HC A04/MF A01 CSCL 01C

An investigation was conducted into the nature of corrections for angle-of-attack and angle-of-sideslip measurements obtained with sensors mounted in front of each wingtip of a general aviation airplane. These flow corrections have been obtained from both wind-tunnel and flight tests over an angle-of-attack range from 0 to 85 deg. Both the angle-of-attack and angle-of-sideslip flow corrections were found to be substantial. The corrections were a function of the angle of attack and angle of sideslip and were fairly insensitive to configuration changes and rotational effects. The angle-of-attack flow correction determined from the static wind-tunnel tests agreed reasonably well with the correction determined from flight tests. Author

**COMPUTER PROGRAM FOR PERFORMANCE PREDICTION OF TANDEM-ROTOR HELICOPTERS M.S. Thesis**
D. L. COTNER Jun. 1985 42 p
(AD-A159193) Avail: NTIS HC A03/MF A01 CSCL 01C

A computer program for the HP-41 series calculator is presented which predicts the rotor shaft horsepower required for tandem-rotor helicopters to a given set of helicopter parameters and flight conditions. Three simplified analytical methods of calculating the induced power for tandem-rotor helicopters were explored during the development of the program and their effect on the total shaft horsepower required was compared to actual test data. These comparisons as well as size and complexity considerations were used in selecting the method to be used. The program can be used in preliminary design analysis and as an educational tool where only an estimate of the actual shaft horsepower is required. Author (GRA)

**INVESTIGATIONS OF THE AIRCRAFT LANDING PROCESS USING A COMPUTERIZED SIMULATION MODEL BASED ON THE MONTE CARLO METHOD**
H. J. PETERS May 1985 111 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-951)
(DFVLR-FB-85-27; ISSN-0171-1342) Avail: NTIS HC A06/MF A01; DFVLR, Cologne DM 35.50

A landing approach simulation model based on the data from a civil airport and on the Monte Carlo theory is developed using the General Purpose Simulation System on FORTRAN 4. The model is improved to investigate the landing process with constant and variable landing times. The theoretical landing time distribution with waiting times verified with the Chi-square test show good agreement with the empirical landing time distribution. The turn time and landing time distribution with waiting time parameters are verified by statistical comparison of the simulated distribution and the empirical one. The efficiency of the test distributions is improved with a relevant landing time delimitation. The test distributions are tested successfully in other airports. Author (ESA)

**AN OPTIMISATION METHOD FOR RECONSTRUCTION OF FLIGHT PATH TRAJECTORIES FROM NON-SYNCHRONOUS TIME-SAMPLED OBSERVATIONS BY TWO CINE CAMERAS**
A. ROSS, L. MOCKRIDGE, and D. DRUMM Oct. 1984 68 p refs
(ARL-SYS-R-34; AR-003-969) Avail: NTIS HC A04/MF A01

Helicopter flight path trajectories in approach to a tactical landing aid were monitored, ad hoc, by two cine cameras. Post-trial trajectory reconstruction using simple triangulation methods was confounded by the presence of an unknown bias error in the orientation of one camera, and by nonsynchronous camera timing. The report describes the concept, formulation and implementation of an optimization method which pools all data for a trajectory, permits extraction of bias terms, and yields a complete trajectory smoothed in space and time. **ROTORCRAFT DYNAMICS 1984**
Nov. 1985 497 p refs Proceedings of the 2d Decennial Specialists' Meeting on Rotorcraft Dynamics, Moffett Field, Calif., 7-9 Nov. 1984; sponsored by NASA. Ames Research Center and the American Helicopter Society
(NASA-CP-2400; REPT-85122; NAS 1.55:2400) Avail: NTIS HC A21/MF A01 CSCL 01C

In the conference proceedings are 24 presented papers, their discussions, and material given in two panels. The presented papers address the general areas of the dynamics of rotorcraft or helicopters. Specific topics include the stability of rotors in hover and forward flight, the stability of coupled rotor-fuselage systems in hover, the loads on a rotor in forward flight including new developments in rotor loads calculations, and the calculation of rotorcraft vibration and means for its control or suppression. Material in the first panel deals with the successful application of dynamics technology to engineering development of flight vehicles. Material in the second panel is concerned with large data bases in the area of rotorocraft dynamics and how they are developed, managed, and used.

**TEST RESULTS FROM A DYNAMIC MODEL DYNAFLEX ROTOR**
C. F. NIEBANCK and R. K. GOODMAN *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 57-68 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01C

A one-fifth scale dynamic model of the Sikorsky Dynaflex rotor was tested in hover and in forward flight conditions in a wind tunnel. The Dynaflex rotor features an advanced composite structure which flexes to provide a constant speed universal joint action. Testing concentrated on confirming that the stability and dynamic response of the rotor were satisfactory. Lift conditions of up to .11 Ct/sigma and advance ratios as high as .46 were reached. Vibratory loads were compared to those of articulated rotors. The Dynaflex rotor concept appears to be a practical concept from the standpoint of dynamic response and stability. Author

**OPTIMAL DESIGN APPLICATION ON THE ADVANCED AEROELASTIC ROTOR BLADE**
F. S. WEI and R. JONES *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 137-151 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01C

The vibration and performance optimization procedure using regression analysis was successfully applied to an advanced aeroelastic blade design study. The major advantage of this regression technique is that multiple optimizations can be performed to evaluate the effects of various objective functions and constraint functions. The data bases obtained from the rotorcraft flight simulation program C81 and Myklestad mode shape program are analytically determined as a function of each design variable. This approach has been verified for various blade radial ballast weight locations and blade planforms. This method can also be utilized to ascertain the effect of a particular cost function which is composed of several objective functions with different weighting factors for various mission requirements without any additional effort. **DEVELOPMENT AND APPLICATION OF A TIME-HISTORY ANALYSIS FOR ROTORCRAFT DYNAMICS BASED ON A COMPONENT APPROACH**
R. SOPHER and D. W. HALLOCK *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 153-169 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01C

A time history analysis for rotorcraft dynamics based on dynamical substructures, and nonstructural mathematical and aerodynamic components is described. The analysis is applied to predict helicopter ground resonance and response to rotor damage. Other applications illustrate the stability and steady vibratory response of stopped and gimballed rotors, representative of new technology. Desirable attributes expected from modern codes are realized, although the analysis does not employ a complete set of techniques identified for advanced software. The analysis is able to handle a comprehensive set of steady state and stability problems with a small library of components. Author

**EVALUATION OF A LOAD CELL MODEL FOR DYNAMIC CALIBRATION OF THE ROTOR SYSTEMS RESEARCH AIRCRAFT**
R. W. DUVAL (Advanced Rotorcraft Technology, Inc., Los Altos, Calif.), H. BAHRAMI, and B. WELLMAN *In its* Rotorcraft Dynamics 1984 p 379-393 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01C

The Rotor Systems Research Aircraft uses load cells to isolate the rotor/transmission system from the fuselage. An analytical model of the relationship between applied rotor loads and the resulting load cell measurements is derived by applying a force-and-moment balance to the isolated rotor/transmission system. The model is then used to estimate the applied loads from measured load cell data, as obtained from a ground-based shake test. Using nominal design values for the parameters, the estimation errors, for the case of lateral forcing, were shown to be on the order of the sensor measurement noise in all but the roll axis. An unmodeled external load appears to be the source of the error in this axis. Author

**F-111 NATURAL LAMINAR FLOW GLOVE FLIGHT TEST DATA ANALYSIS AND BOUNDARY LAYER STABILITY ANALYSIS Contractor Report, Aug. 1981 - Jul. 1983**
L. J. RUNYAN, B. H. NAVRAN, and R. A. ROZENDAAL Jan. 1984 224 p refs
(Contract NAS1-15325)
(NASA-CR-166051; NAS 1.26:166051; D6-51153) Avail: NTIS HC A10/MF A01 CSCL 01C

An analysis of 34 selected flight test data cases from a NASA flight program incorporating a natural laminar flow airfoil into partial wing gloves on the F-111 TACT airplane is given. This analysis determined the measured location of transition from laminar to turbulent flow. The report also contains the results of a boundary layer stability analysis of 25 of the selected cases in which the crossflow (C-F) and Tollmien-Schlichting (T-S) disturbance amplification factors are correlated with the measured transition location. The chord Reynolds numbers for these cases ranges from about 23 million to 29 million, the Mach numbers ranged from 0.80 to 0.85, and the glove leading-edge sweep angles ranged from 9 deg to 25 deg. Results indicate that the maximum extent of laminar flow varies from 56% chord to 9-deg sweep on the upper surface, and from 51% chord at 16-deg sweep to 6% chord at 25-deg sweep on the lower. The results of the boundary layer stability analysis indicate that when both C-F and T-S disturbances are amplified, an interaction takes place which reduces the maximum amplification factor of either type of disturbance that can be tolerated without causing transition. CSCL 01C

This volume of the light helicopter family (LHX) trade-off analysis (TOA) report contains the reports of two seperate but related analyses. The first is the force structure analysis that identifies the foreseeable impact of the LHX on the Army's aircraft and manpower requirements. The study concludes that: (1) the total LHX force structure requirements are: (a) LHX-SCAT - 3,072 aircraft; and (b) LHX-Utility - 1,951 aircraft; and (2) depending on LHX candidate, maintenance personnel savings of 8 to 10% are achievable. The second analysis is of reliability, availability, and maintainability/logistics (RAM/LOG). The RAM/LOG analysis intended to identify and quantify the minimum values of RAM and associated supportability goals that the LHX would need to achieve. The RAM/LOG findings/conclusions included: (1) optimum unit size: (a) 11 aircraft per attack helicopter battalion company; and (b) 10 aircraft per aviation reconnaissance squadron troop; (2) 5.7 to 5.8 aircraft flying hours per aircraft per day are the objective flight program; (3) 1.0-hour mean time to repair; (4) 3.6-maintenance man-hours/flight hour maintenance ratio; and (5) 7.1 to 8.7 hours mean time between mission about failure (minimum acceptable value). GRA

L. E. MILLER and P. G. KOCH Jul. 1985 284 p
(Contract DA PROJ. 136-6)
(AD-A158227; AFFDL-TR-75-89-REV-2) Avail: NTIS HC A13/MF A01 CSCL 01B

This report addresses the problems associated with the derivation of aircraft performance characteristics. The emphasis is on segments which are a part of a mission profile. In particular, the following areas are studied; takeoff, climb, cruise, descent and glide, turning, and landing. The generalized approach to performance estimates is first presented. Next, appropriate solutions are derived. Last sensitivity relationships are developed. The relationships determine changes in the performance characteristics as a result of an aircraft configuration change. This permits rapid evaluation of the performance variations for any segment of a mission profile. GRA

**THE RELATIONSHIP BETWEEN MATERIAL FAILURES AND FLIGHT HOURS: STATISTICAL CONSIDERATIONS**

M. S. GOLDBERG Jan. 1985 22 p
(Contract N00014-83-C-0725)
(AD-A159571; CNA-PP-430) Avail: NTIS HC A02/MF A01
CSCL 01C

This paper attempts to clarify the relationships among the following four hypotheses: (1) the number of material failures across intervals of calender time containing equal accumulated flight hours follows a Poisson distribution; (2) the number of elapsed flight hours between successive independent material failures follows an exponential distribution; (3) the expected number of monthly material failures is exactly proportional to monthly flight hours; and (4) the observed number of monthly material failures is strongly correlated with monthly flight hours. By a well-known result, hypotheses (1) and (2) are equivalent. By a second well-known result, hypotheses (1) and (3) are also equivalent. However, hypotheses (1) and (4) are not equivalent. That is, while the expected number of failures is exactly proportional to flight hours under a Poisson distribution, this relationship is not revealed by a linear regression between failures and flight hours. For example, we demonstrate that if the mean and variance of flight hours across months are equal and if the failure rate per flight hour equals .01, then the correlation between failures and flight hours will equal .10. **FRENCH PROGRAM CHARME DEVELOPS PROPFAN AIRCRAFT**

*In its* West Europe Report: Science and Technology (JPRS-WST-85-024) p 22-24 13 Aug. 1985 Transl. into ENGLISH from AFP Sciences (Paris), 14 Mar. 1985 p 25-27
Avail: NTIS HC A04/MF A01

France has decided to begin studies on future engines for heavy cargo propeller planes. The first research in France started around 1978, three years after the American Hamilton Standard (of the United Technologies group, which also owns Pratt and Whitney). The French studies are currently carried out as part of the Propeller Design for Fast Plane for Greater Economy (CHARME) program. The French government prefers the term fast plane propeller instead of the American names Propfan, Freefan, or Unducted Fan (UDF) of General Electric. A test of a new propeller, perfected in France and consisting of 12 blades, is scheduled for September 1985 in a wind tunnel which will model flight conditions. This test is intended to determine the noise level of this propeller. R.J.F.

**EVALUATION OF TAPE RECORDINGS FROM AN AIRBORNE DIGITAL RECORDER [VYHODNOCOVANI MAGNETICKYCH ZAZNAMU Z PALUBNIHO CISLICOVEHO ZAPISOVACE]**

J. STEPANOVSKY Zpravodaj VZLU (ISSN 0044-5355), no. 2, 1985, p. 91-95. In Czech.

A ground-based computerized system for evaluating magnetic tape recordings made by an onboard digital recorder is described. In particular, attention is given to the operation of the computer and its peripherals. The software used in the system is analyzed from the standpoint of the support of computer and onboard recorder functions and from the standpoint of the user. V.L.

**THE POSSIBILITY OF USING A FLIGHT RECORDER FOR THE ANALYSIS OF PILOT PERFORMANCE [MOZNOSTI VYUZITI PALUBNIHO ZAPISOVACE K ANALYZE CINNOSTI PILOTA]**

L. ODSTRCIL Zpravodaj VZLU (ISSN 0044-5355), no. 2, 1985, p. 109, 110. In Czech.

It is shown how a flight recorder can be used for the analysis of the performance of the crew during the flight in order to obtain information useful in the flight training process. A segment analysis of individual flight stages is recommended as an optimum approach. The use of a recorder is particularly effective with flight simulators since pilot performance can be evaluated immediately following a flight stage or a particular flight situation that is being practiced. V.L.

**BIG PICTURE - ANSWER TO THE BIG PROBLEM?**

K. WALKER Flight International (ISSN 0015-3710), vol. 128, Nov. 2, 1985, p. 22-24.

'Big Picture' is an experimental fighter cockpit instrument system whose large area display entirely replaces the conventional instrument panel. Big Picture will apprise pilots of enemy aircraft positions, those of friendly aircraft, air-to-air and surface-to-air missile threats, and terrain, on a 300-400 sq in screen which is touch-sensitive to permit selection of different data types. Helmets incorporating brain activity sensors that could be used to actively control the display are under development in conjunction with Big Picture. O.C.

**AVIONICS UPDATE 1986**

M. HIRST Air International (ISSN 0306-5634), vol. 29, Dec. 1985, p. 283-286.

A development trend and performance improvement evaluation is conducted for state-of-the-art U.S. and West European military avionics, encompassing sensors, signal processors, and user systems. Laser radar, or lidar, is noted to be the critical emerging technology in jam-resistant active sensors for target identification and navigation. Digital signal processor miniaturization achievements are highlighted, together with improvements in cockpit CRT displays. A closing, speculative assessment of prospects for the application of machine intelligence to future avionics is included. O.C.

**FLIGHT DATA ANALYSIS AND STORAGE SYSTEM (FASS)**

B. STOCKER, E. W. SPENCER, and R. SULINSKI (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 8 p.

While the Real-time Acquisition and Processing of Inflight Data system is an effective tool for the acquisition, processing and storage of inflight measurements, the great volume and variety of data recorded for each flight has rendered responsive data access difficult except on a single-flight basis. Accordingly, the Flight Data Analysis and Storage structural statistics library has been developed to accumulate data over the course of an entire flight test program, greatly improving data retrieval capability. This represents an 80-percent reduction in manhours spent in assembling in-flight measurements for component fatigue substantiation. O.C.

**A86-18423**

**A STRUCTURED APPROACH FOR INTEGRATION AND TEST OF AVIONICS SYSTEMS**

J. M. MEDWETZ (IBM Corp., Federal Systems Div., Owego, NY) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 11 p.

Much of the process of contemporary avionics system development involves assembling system elements, achieving integrated function, and validating performance. In the case of complex systems, the efficiency required in integration and testing efforts can be enhanced by ensuring that system specifications are testable before they become binding, by applying computer data base capabilities that can furnish a matrix for the definition of well organized test/development approaches and for the monitoring of progress, and by employing efficient data collection schemes. The effectiveness of these recommendations is noted in their application to the U.S. Navy's Light Airborne Multi-Purpose System. O.C.

**US ARMY FLIGHT CONDITION MONITORING**

R. L. BUCKNER and D. J. MERKLEY (U.S. Army, Applied Technology Laboratory, Fort Eustis, VA) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 5-1 to 5-15. refs

The Flight Condition Monitoring (FCM) method of acquiring operational usage data is presented as it was developed from U.S. Army helicopter service usage programs from 1964 to present. The importance of incorporating operational usage data in fatigue design approaches, such as Safe-Life and Damage Tolerance, is discussed with emphasis on the establishment of dynamic component fatigue lives. The Army's service usage programs are critically reviewed to determine areas of sensitivity in establishing design mission spectra for rotary-winged aircraft. The feasibility of utilizing FCM with state-of-the-art microprocessor recorder technology on future in-service programs is presented with suggested unified approaches to mission spectrum development on current and future helicopter systems. Author

**SPECIALISTS' MEETING ON ADVANCED COCKPIT DESIGN, GRAPEVINE, TEX, OCTOBER 3, 4, 1984, PROCEEDINGS**

Meeting sponsored by AHS. Alexandria, VA, American Helicopter Society, 1984, 211 p. For individual items see A86-18452 to A86-18465.

The present conference on helicopter avionics discusses analytical methods for LHX mission and task analysis, Standard Helicopter Abstract Mission Simulation, a wide angle, low altitude flight simulator vision system for cockpit research and aircrew training, LED displays, thin film electroluminescent displays, the use of a stored topographic data base in modern military helicopters, and head-mounted displays. Also considered are 'virtual cockpit' concepts for the LHX, panoramic display techniques for the LHX, aspects of integrated cockpit information displays, specific differences arising in future helicopter cockpit designs due to civil and military requirements, the operational impact of night vision devices, electroluminescent lighting for the AH-64A helicopter, and the use of interactive voice systems in military helicopters. O.C.

**OVERVIEW OF ADVANCED DISPLAY TECHNOLOGIES**

J. R. TRIMMIER (Sperry Corporate Technology Center, Phoenix, AZ) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 16 p.

The large volume of latent information in advanced digital aircraft systems has required the development of displays for selective presentation only the most pertinent information. Attention is presently given to display technologies whose volume represents a significant reduction from that of the conventional CRT. The most promising systems are liquid crystal displays thin film ac electroluminescent panels, matrix LEDs, vacuum fluorescent panels, ac plasma panels, and flat and 'shadow mask' CRTs. O.C.

**A86-18456**

**A THIN FILM ELECTROLUMINESCENT DISPLAY FOR COCKPIT APPLICATIONS**

G. L. VICK, J. P. SHEPHARD, W. G. RUNYAN, and J. S. TRCKA (Rockwell International Corp., Cedar Rapids, IA) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 12 p.

For aircraft cockpit applications, thin films electroluminescent (TFEL) flat panel displays must be sunlight-readable and sufficiently rugged to sustain combat mechanical, thermal, and other stresses. In addition, panel reflectivity must be lower than for conventional applications. Attention is presently given to a TFEL system developed for the A-10 ground support aircraft, with a view to its display driver control circuitry, display memory, character interface circuitry, and power supply design. Preliminary results are presented. O.C.

**A86-18458**

**ADVANCED LIGHT EMITTING DIODE (LED) DISPLAYS-PACED BY TECHNOLOGY OR SYSTEMS APPLICATION?**

J. WRIGHT (Litton Systems Canada, Ltd., Rexdale, Canada) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 21 p.

Attention is given to the development prospects and drivers of LED display surfaces fabricated by means of discrete, die displacement/wire-bonding techniques, containing integrated serial data interface/decode capability together with associated current sources and sinks. Chromatic, resolution and preceptual characteristics are treated, along with dimensional limits, thermal and power consumption characteristics, and likely cost/performance tradeoffs. Predictions cited are based on development data generated in the course of the last eight years, therefore possessing a high confidence factor for the next 3-4 years. O.C.

**A86-18459**

**USE OF A STORED TOPOGRAPHIC DATA BASE IN THE MODERN MILITARY HELICOPTER**

K. P. GIBBS and J. A. GRACIA (Harris Corp., Government Aerospace Systems Div., Melbourne, FL) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 10 p.

A stored topographical data base may be employed to significantly enhance military helicopter pilot efficiency while reducing workloads. Geographic orientation is automated by furnishing a plan view map with a helicopter position symbol; terrain correlation eliminates the need for position updating and facilitates autonomous navigation, especially in nap-of-the-earth flying. The stored data base also provides a look-ahead capability from cover that is especially useful when presented in a perspective format. The storage of elevation values is directly applicable to terrain following/terrain avoidance. O.C.

**A86-18460**

**HMD: GLOBAL HUD SOLUTION**

D. J. ROTIER (Honeywell, Inc., Avionics Div., St. Louis Park, MN) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 14 p.

A comparative assessment is made of candidate Helmet Mounted Display (HMD) system configurations for single crew member helicopter night flying, giving attention to aircraft loss probability in a high threat combat environment due to system failures, and to the achievement of a minimum head-supported weight value for a system that furnishes the requisite display system redundancy. Both monocular/binocular HMD systems are considered, as are combined monocular/binocular, image intensifier-based, and night vision goggles-based systems. Redundant sensors are noted to be required for combat safety and mission effectiveness. O.C.

**A86-18461**

**HELICOPTER COCKPIT AVIONICS DEVELOPMENT OR THE ADVANCED TRANSPORT AND NEXT GENERATION AIRCRAFT**

C. SCOUGHTON, R. JOHNSTON, and R. COHEN (Bendix Aerospace Sector, Flight Systems Div., Teterboro, NJ) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 28 p.

Significant advances are currently being made in cockpit technology. One advanced cockpit design currently under development by Bendix provides a fully integrated avionics management approach for a new technology military transport helicopter. However, for next generation helicopters such as the Army's LHX, innovative new approaches are required to provide a tighter coupling between pilot and aircraft. An overview of the avionics management system being developed for the Boeing-Vertol Model 360 is presented with emphasis on crew assist functions to reduce stress and increase overall crew efficiency. This is followed with a discussion of crew station drivers, requirements, and technologies for a next generation cockpit solution. Author

**A86-18463**

**HUGHES HELICOPTERS AH-64A ELECTROLUMINESCENT LIGHTING**

T. C. KNIGHT and J. E. RITTER (Hughes Helicopters, Inc., Culver City, CA) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 20 p. refs

Favorable experience with electroluminescent formation lights and natural compatibility with night vision devices led to Electroluminescent Light as a consideration for secondary cockpit illumination. Electroluminescence provides a cool, flat, dependable, low-level light source. The brightness is uniform overall and it casts no shadows. The most efficient light output is blue-green. This is also the color that is most effective with night vision goggles, cathode ray tubes and other night vision aids. The equipment and the relationship to cockpit lighting and night vision will be examined. It meets or exceeds applicable military standards. This new application offers an opportunity to extend the technology into an area certain to be used heavily in the future. Author

**TOWARD AN AVIONICS SUPERSYSTEM**

Defense Electronics (ISSN 0278-3479), vol. 17, Dec. 1985, p. 73, 75, 77 (4 ff.).

Design features, performance objectives and development status assessments are presented for the U.S. Air Force's Pave Pillar program, which has as its goal the creation of a central computer/multiplex bus architecture for a single modular avionics system integrating communications, navigation, targeting, fire control, offensive and defensive EW, and systems status monitoring functions. Attention is given to the Pave Pillar components designated 'Integrated Electronic Warfare System' and 'Low Altitude Navigation and Targeting IR system for Night' (LANTIRN). LANTIRN furnishes tactical strike aircraft with day/night all-weather high speed/low altitude flight and weapons delivery capabilities, and is to be deployed on F-15E, F-16C/D, and A-10 aircraft. The current status of the Airborne Self-Protection Jammer system is assessed. O.C.

**THE EVOLUTION OF THE COCKPIT DISPLAYS IN COMMERCIAL AIRLINES [EVOLUTION DU POSTE DE PILOTAGE DES AVIONS DE LIGNE]**

J. CASTIES (Thomson-CSF, Division Equipements Avioniques, Malakoff, France) Navigation (Paris) (ISSN 0028-1530), vol. 33, Oct. 1985, p. 399-408. In French.

The development of high resolution CRTs has led to the installation of digitized information displays in instrument panels of passenger aircraft. Integrated circuits provided the necessary reliability and image clarity for ensuring flight safety. The devices were first used in simulators for the Concorde and then for flight hardware on the 757 and 767 aircraft. Shadow-mask technology, being implemented for the new generation of Airbus vehicles, has sufficient stability due to the electron gun alignment configuration that the technology is being tested for use in helicopters, which experience high vibration levels. The new avionics displays furnish navigation, aircraft control and flight management information, including digitized maps, meteorological and radar data. Data can be split into two screens, one for status displays and another for checklist procedures for, e.g., compensating for a malfunction. The avionics on the Airbus 320, scheduled for delivery in 1988, will feature a common computer for the displays and a mini-controller for directing the aircraft. Directions being taken to introduce AI into the avionics are briefly discussed. M.S.K.

**INFORMATION-MEASUREMENT COMPLEXES OF FLIGHT VEHICLES [KOMPLEKSIROVANIE INFORMATSIONNO-IZMERITEL'NYKH USTROISTV LETATEL'NYKH APPARATOV]**

IU. P. IVANOV, A. N. SINIAKOV, and I. V. FILATOV Leningrad, Izdatel'stvo Mashinostroenie, 1984, 208 p. In Russian. refs

The concept of information-measurement complexes is defined, and the principles governing the synthesis of such complexes are presented along with their classification. The statistical characteristics of the main instruments in an information-measurement complex are then analyzed, and mathematical models are developed which describe measurements in time and frequency domains and also in state space in accordance with the specific characteristics of measurements on a flight vehicle. Further, the discussion focuses on the principal properties of estimates, the structure of a multichannel complex system, synthesis of optimal linear complex measurement systems, and inertialess nonlinear optimal complex measurement systems. Finally, complex data processing in the control systems of elastic flight vehicles is examined. V.L.

**DYNAMIC CHARACTERISTICS OF AIR DATA SENSOR SYSTEMS: ALTIMETER, SPEEDOMETER AND ALPHA X BETA VANE**

Y. TSUKANO and T. ONO 1985 20 p refs In JAPANESE; ENGLISH summary

(NAL-TR-852; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

Dynamic response characteristics of air-data-sensor systems including a pressure altitude sensor, a dynamic pressure sensor and a alpha beta vane are described in this paper. These air data sensors are currently used as part of instrumentation systems for the Variable Stability and Response Airplane (VSRA). Responses of the pressure sensor system to stepwise inputs from both static and total pressure ports were measured and analyzed to identify the dynamic model of the system, which is assumed to be linear. Response of a alpha beta vane to initial displacement were measured in a 2 m diameter wind tunnel at wind speeds from 30 m/s to 55 m/s and the assumed dynamic model including weak nonlinearity was identified. Author

V. TSEYUKOV *In its* USSR Report: Cybernetics, Computers and Automation Technology (JPRS-UCC-85-009) p 25-26 19 Nov. 1985 Transl. into ENGLISH from Vozdushnyy Transport (Moscow, USSR), 17 Aug. 1985 p 3

Avail: NTIS HC A04

The controls of airplanes of the future will have far fewer electro-mechanical devices. Such devices and dozens of dials and lights will be replaced by the screen of a cathode-ray tube. The development of this kind of integrated information-signaling system is now in progress. With aviation technology advancing rapidly, aircraft systems are becoming more complex, and the most important ones have back-up systems. It is not easy for a pilot to control an aircraft and interact with instruments and devices. The new system will make it possible to remove a portion of the devices that are located directly in front of the pilot, and to remove all the devices from the flight engineer's panel. Needed information on the operation of all of the airplane's maintenance systems and several of its main units will be concentrated in a single place--on the color screens of cathode-ray tubes in the center of the instrument panel. **COATING REQUIREMENTS IN GAS TURBINE ENGINES**

G. W. MEETHAM (Rolls-Royce, Ltd., Derby, England) Journal of Vacuum Science and Technology A (ISSN 0734-2101), vol. 3, Nov.-Dec. 1985, p. 2509-2515. refs

Four types of coatings, with special emphasis on their use in gas turbine engines, are discussed. First, a corrosion resistant coating, aluminide, is considered. It is found that aluminide coatings on engines used in salt contaminated environments improved the corrosion resistance; however, the use of a coating thickness above specification caused brittle cracking of the aluminide coat which could propagate into the base material. Then, thermal barrier coatings based on the low thermal conductivity of ZrO2 are examined. It is shown that the replacement of an initial three-layer coating by a two-layer coating brought about major improvements in the temperature capability and the thermal fatigue resistance of the engines; a fourfold in thermal resistance is achieved. Finally, wear resistance and abradable coatings are addressed, determining that shrouds on turbine rotor blades form a very effective gas path seal and contribute very significantly to turbine efficiency. Although in the past coatings have been regarded as 'post design bolt-on features', they are now part of the design process. F.J.

**FLAME RIG TESTING OF THERMAL BARRIER COATINGS AND CORRELATION WITH ENGINE RESULTS**

G. JOHNER and K. K. SCHWEITZER (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) Journal of Vacuum Science and Technology A (ISSN 0734-2101), vol. 3, Nov.-Dec. 1985, p. 2516-2524. refs

To minimize detrimental thermal stresses in high-performance aeroengines, attempts are made to protect hot components, e.g., combustion chambers, blades, vanes, etc., with plasma-sprayed zirconia coatings. In the present evaluation, the best coating material is first defined using an appropriate rig test. Two different types of test rig, one simulating mainly thermal fatigue stresses and the other centrifugal stresses, are described in detail. The results obtained in each rig with thermal barrier coatings of different chemical composition are also discussed. For the application of thermal barrier coatings in aeroengines, it is necessary to analyze the main stresses on the component to be coated. The paper uses a turbine vane and a blade as examples. In addition, another flame rig is presented which permits the simulation of stresses very similar to those in jet engines. The results of these tests are compared with the behavior of thermal barrier coatings on turbine blades and vane segments in a production-type engine. Author

**THE INFLUENCE OF FORWARD FLIGHT ON THRUST AUGMENTING EJECTORS**

A. KROTHAPALLI, L. VAN DOMMELEN (Florida State University, Tallahassee), and K. KARAMCHETI (Stanford University, CA) AIAA, Fluid Dynamics and Plasmadynamics and Lasers Conference, 18th, Cincinnati, OH, July 16-18, 1985. 12 p. refs (AIAA PAPER 85-1589)

A theoretical analysis is carried out for the flow through a constant area ejector in the presence of a uniform free stream. It is shown that multiple solutions can occur. However, only those which fulfill the entropy condition are considered. For subsonic flight Mach numbers, it is found that the thrust augmentation ratio decreases rapidly with increasing free stream Mach number. In the supersonic range of flight Mach numbers, two solutions were found, one with a relatively large augmentation ratio and the other with an augmentation ratio close to unity. The nature of the different solutions is explained. In addition, their dependence on various parameters, such as pressure, temperature and area ratios was investigated. Author

**TURBOFAN ENGINES FOR COMMERCIAL AIRCRAFT [ZWEISTROMTRIEBWERKE FUER VERKEHRSFLUGZEUGE]**

E. SCHESKY (Dresden, Hochschule fuer Verkehrswesen, East Germany) Technisch-Oekonomische Information der zivilen Luftfahrt (ISSN 0232-5012), vol. 21, no. 5, 1985, p. 192-194. In German. refs

Schesky (1973) has discussed the development of engines for commercial aircraft. The present article is concerned with the continuation of this development during the preceding 15 years, taking into account also predictions for the next 15 years. Only jet turbine engines for the air traffic are considered. A classification of jet turbine engines is presented. It is pointed out that turbofan engines with a high bypass ration represent currently the most important category for commercial flight applications. Attention is given to the state of development of these engines at about 1970, the current state of development, and development trends. It is found that very significant advances with respect to turbofan engines have been made since 1960. However, there remain possibilities for further improvement, in particular with regard to the utilization of new materials. G.R.

**STABILITY OF LIMIT CYCLES IN FRICTIONALLY DAMPED AND AERODYNAMICALLY UNSTABLE ROTOR STAGES**
A. SINHA (Pennsylvania State University, University Park) and J. H. GRIFFIN (Carnegie-Mellon University, Pittsburgh, PA) Journal of Sound and Vibration (ISSN 0022-460X), vol. 103, Dec. 8, 1985, p. 341-356. refs
(Contract NAG3-231)

This paper deals with the stability of limit cycles (Steady-State Oscillations) associated with the multi-degree-of-freedom model of a frictionally damped and aerodynamically unstable rotor stage. By using the first order averaging technique, a generalized criterion has been established to sort out those unstable limit cycles which govern the maximum transient amplitude beyond which the rotor stage becomes unstable.The stability of the remaining steady-state solutions is analyzed by linearizing the averaged system of differential equations. Numerical results are discussed for three-, four- and five-bladed disks. Author

Development of the supersonic cruise aircraft engine continued in this National Aeronautics and Space Administration (NASA) sponsored Pratt and Whitney program for the Preliminary Design of an Advanced High-Pressure Turbine. Airfoil cooling concepts and the technology required to implement these concepts received particular emphasis. Previous supersonic cruise aircraft mission studies were reviewed and the Variable Stream Control Engine (VSCE) was chosen as the candidate or the preliminary turbine design. The design was evaluated for the supersonic cruise mission. The advanced technology to be generated from these designs showed benefits in the supersonic cruise application and subsonic cruise application. The preliminary design incorporates advanced single crystal materials, thermal barrier coatings, and oxidation resistant coatings for both the vane and blade. The 1990 technology vane and blade designs have cooled turbine efficiency of 92.3 percent, 8.05 percent Wae cooling and a 10,000 hour life. An alternate design with 1986 technology has 91.9 percent efficiency and 12.43 percent Wae cooling at the same life. To achieve these performance and life results, technology programs must be pursued to provide the 1990's technology assumed for this study. Author

**AN-22 TEST BED FOR ADVANCED PROPELLER TECHNOLOGY**
V. BELIKOV *In its* USSR Report: Transportation (JPRS-UTR-85-012) p 22-23 24 Oct. 1985 Transl. into ENGLISH from Izvestiya (Moscow), 12 Jul. 1985 p 1 and 6
Avail: NTIS HC A06

The technological and historical development of the turbofan engine is described. Designers and scientists have given birth to a multiple-bladed propeller which has been named the fan propeller. Flight tests carried out with the fan propeller on the AN-32 aircraft have resulted in increased fuel consumption and greater flying speed. Less noise and vibration problems were reported with the new propellers. B.W.

**DYNAMIC RESPONSE OF FILM THICKNESS IN SPIRAL-GROOVE FACE SEALS**
E. DIRUSSO Dec. 1985 22 p refs
(NASA-TP-2544; E-2683; NAS 1.60:2544) Avail: NTIS HC A02/MF A01 CSCL 21E

Tests were performed on an inward- and an outward-pumping spiral-groove face seal to experimentally determine the film thickness response to seal seat motions and to gain insight into the effect of secondary seal friction on film thickness behavior. Film thickness, seal seat axial motion, seal frictional torque, and film axial load were recorded as functions of time. The experiments revealed that for sinusoidal axial oscillations of the seal seat, the primary ring followed the seal seat motion very well. For a skewed seal seat, however, the primary ring did not follow the seal seat motion, and load-carrying capacity was degraded. Secondary seal friction was varied over a wide range to determine its effect on film thickness dynamics. The seals were tested with ambient air at room temperature and atmospheric pressure as the fluid medium. The test speed ranged from 7000 to 20,000 rpm. Seal tangential velocity ranged from 34 to 98 m/sec (113 to 323 ft/sec). Author

**ANALYSIS OF THE EFFECTS OF TRANSIENT HEAT TRANSFER ON AXIAL FLOW COMPRESSOR BLADE BOUNDARY LAYERS M.S. Thesis**

C. W. WOOD Jun. 1985 69 p
(AD-A158094; AFIT/CI/NR-85-87T) Avail: NTIS HC A04/MF A01 CSCL 21E

This thesis determines the magnitude of heat transfer in the high-pressure compressor of a turbofan engine during a Bodie throttle transient and estimates the effect of transient heat transfer on compressor blade boundary layer growth. Total stored thermal energy available for release is determined considering compressor blades and roots only. Thermal energy released during a throttle transient is determined and allocated to individual compressor stages and used to estimate blade heat flux. The average heat transfer coefficient at the maximum heat transfer rate is also calculated. A simple boundary layer analysis is performed assuming zero pressure gradient, compressible turbulent flow over a flat plate. Under free-stream conditions similar to those in the tenth stage of the compressor, this analysis shows increased boundary layer displacement thickness with heat transfer. In zero pressure gradient, the displacement thickness change with heat transfer is small, as is the change in flow deviation angle at the trailing edge of the compressor blade. Heat transfer coefficients are also calculated in the boundary layer analysis and agree with results from the experimental heat transfer allocation procedure to within 30%. Results of boundary layer analysis indicate assumptions made in heat transfer allocation procedure are reasonable and that simple boundary layer analysis with the absence of modifying pressure gradients provides a good first estimate of heat transfer effects on blade boundary layers. This study, for OUSDRE (Research and Advanced Technology, Military Systems Technology), examines the nature of the small gas turbine development process for military applications, attempts to identify gaps between current programs and probable future needs, and makes program recommendations for acquiring desirable new turbine technology. Small turbines are found to fall into one of four categories: man-rated, expendable, auxiliary power, and ground vehicle engines. The technical requirements of each category are reviewed and possible R&D opportunities identified. GRA

**RESONANT CAVITIES FOR STALL RECOVERY IN GAS TURBINE ENGINES Patent Application**

FRENCH, inventor (to Air Force) 23 Jul. 1985 20 p
(AD-D011891; US-PATENT-APPL-SN-757994) Avail: NTIS HC A02/MF A01 CSCL 21E

The present patent application is related generally to aircraft which use gas turbine engines as a means of propulsion, and specifically to a means for improvement in the stall recoverability characteristics of such gas turbine engines through the use of resonant cavities. The ability of gas turbine engines to recover when their compressors enter a rotating stall is enhanced with the accessing resonant cavity to the compressor exhaust port. The added volume of the resonant cavities induces a dynamically unstable operating point in the rotating stall as the cavity acts as a Helmholtz resonator matched with the dynamics of the primary flow. The resonant cavity is effective in enhancing the stall recovery characteristics of the engine. GRA

**STABILITY OF THE STEADY-STATE GLIDING OF A FLIGHT VEHICLE [OB USTOICHIVOSTI STATSIONARNOGO REZHIMA PLANIROVANIIA LETATEL'NOGO APPARATA]**

O. IU. CHERKASOV Moskovskii Universitet, Vestnik, Seriia 1 - Matematika, Mekhanika (ISSN 0579-9368), Sept.-Oct. 1985, p. 80-83. In Russian.

The paper is concerned with the stability of the steady-state gliding of a plate model of a flight vehicle for the case of an arbitrary angle between the resultant of the aerodynamic forces and the plate. For assumptions that are more general than those made in the well-known Zhukovskii problem (Zhukovskii, 1948), it is shown that wave-like and loop-like trajectories tend to stable gliding. V.L.

**FOR AGILE READ ACTIVE**

G. WARWICK Flight International (ISSN 0015-3710), vol. 128, Nov. 9, 1985, p. 29-31.

Agility is defined as a combination of vehicle performance and handling qualities enabling rapid and precise changes in helicopter position or flight path; it is a function of excess rotor thrust available together with the speed of redirection. Attention is presently given to the necessity of developing military helicopter 'test bed' vehicles with which to explore and refine novel high agility technologies. Such demonstrator aircraft are especially valuable in answering questions associated with nap-of-the-earth flight, where agility is most critical. Fly-by-wire, sidestick pilot controls and automatic flight controls are among the candidate technologies for development and demonstration programs. O.C.

(NASA-TM-86799; H-1328; NAS 1.15:86799) Avail: NTIS HC A02/MF A01 CSCL 01C

An autopilot can be used to provide precise control to meet the demanding requirements of flight research maneuvers with high-performance aircraft. This paper presents the development of control laws for a flight test maneuver autopilot for an F-15 aircraft. A linear quadratic regulator approach is used to develop the control laws within the context of flight test maneuver requirements by treating the maneuver as a finite time tracking problem with regulation of state rates. Results are presented to show the effectiveness of the controller in insuring acceptable aircraft performance during a maneuver. Author

An analysis was conducted of the attitude and flightpath angle response of configurations used in the Total In-Flight Simulator (TIFS) pitch-rate command systems program. The results show poor correlation between pilot ratings and attitude response and indicate that attitude was not a major influence in the results. A strong correlation was found to exist, however, between the amount of flightpath angle peak overshoot and the pilot ratings. This correlation is similar to the best correlations that have been obtained in recent closed-loop and time-domain analyses but has the advantage of greatly simplified implementation and interpretation. **THE USE OF ACTIVE CONTROLS TO AUGMENT ROTOR/FUSELAGE STABILITY**

F. K. STRAUB (Hughes Helicopters, Inc., Culver City, Calif.) and W. WARMBRODT *In its* Rotorcraft Dynamics 1984 p 1-15 Nov. 1985 refs Previously announced in IAA as A85-43220

Avail: NTIS HC A21/MF A01 CSCL 01C

The use of active blade pitch control to increase helicopter rotor/body damping is studied. Control is introduced through a conventional nonrotating swashplate. State variable feedback of rotor and body states is used. Feedback parameters include cyclic rotor flap and lead-lag states, and body pitch and roll rotations. The use of position, rate, and acceleration feedback is studied for the various state variables. In particular, the influence of the closed loop feedback gain and phase on system stability is investigated. For the rotor/body configuration analyzed, rotor cyclic inplane motion and body roll-rate and roll-acceleration feedback can considerably augment system damping levels and eliminate ground resonance instabilities. Scheduling of the feedback state, phase, and gain with rotor rotation speed can be used to maximize the damping augmentation. This increase in lead-lag damping can be accomplished without altering any of the system modal frequencies. Investigating various rotor design parameters (effective hinge offset, blade precone, blade flap stiffness) indicates that active control for augmenting rotor/body damping will be particularly powerful for hingeless and bearingless rotor hubs. A convenient and versatile procedure for modeling and analyzing ground resonance phenomena is described and illustrated. A computer program is used which dynamically couples differential equations with nonlinear and time dependent coefficients. Each set of differential equations may represent a component such as a rotor, fuselage, landing gear, or a failed damper. Arbitrary combinations of such components may be formulated into a model of a system. When the coupled equations are formed, a procedure is executed which uses a Floquet analysis to determine the stability of the system. Illustrations of the use of the procedures along with the numerical examples are presented. Author

**EXPERIMENTALLY DETERMINED FLUTTER FROM TWO- AND THREE-BLADED MODEL BEARINGLESS ROTORS IN HOVER**
W. G. BOUSMAN and S. DAWSON *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 69-88 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01C

A series of experiments was performed on a 1.8-m-diam model rotor in hover for the principal purpose of investigating the lead-lag stability of isolated bearingless rotors. Incidental to those tests, at least three types of pitch-flap flutter were encountered. Type 1 flutter occurred approximately at the second flap-mode frequency on both two-and three-bladed rotors for both small and large pitch angles and appeared to be a classic pitch-flap flutter. Type 2 flutter showed mostly torsional motion and was seen on both two- and three-bladed rotors. Type 3 flutter was a regressing flap flutter that occurred for only the three-bladed rotor configurations and appears to be a wake excited flutter. Although flutter occurred on a number of different configurations, no rotor parameters were identified that were clearly stabilizing or destabilizing. Author

An aeroelastic stability of three-degree flap-lag-torsion blade in forward flight is examined. Quasisteady aerodynamics with a dynamic inflow model is used. The nonlinear time dependent periodic blade response is calculated using an iterative procedure based on Floquet theory. The periodic perturbation equations are solved for stability using Floquet transition matrix theory as well as constant coefficient approximation in the fixed reference frame. Results are presented for both stiff-inplane and soft-inplane blade configurations. The effects of several parameters on blade stability are examined, including structural coupling, pitch-flap and pitch-lag coupling, torsion stiffness, steady inflow distribution, dynamic inflow, blade response solution and constant coefficient approximation. **COUPLED ROTOR-BODY VIBRATIONS WITH INPLANE DEGREES OF FREEDOM**
H. MING-SHENG and D. A. PETERS *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 325-341 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01C

In an effort to understand the vibration mechanisms of helicopters, the following basic studies are considered. A coupled rotor-fuselage vibration analysis including inplane degrees of freedom of both rotor and airframe is performed by matching of rotor and fuselage impedances at the hub. A rigid blade model including hub motion is used to set up the rotor flaplag equations. For the airframe, 9 degrees of freedom and hub offsets are used. The equations are solved by harmonic balance. For a 4-bladed rotor, the coupled responses and hub loads are calculated for various parameters in forward flight. The results show that the

addition of inplane degrees of freedom does not significantly affect the vertical vibrations for the cases considered, and that inplane vibrations have similar resonance trends as do flapping vibrations.

**ANALYSIS OF POTENTIAL HELICOPTER VIBRATION REDUCTION CONCEPTS**

A. J. LANDGREBE and M. W. DAVIS *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 243-363 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 01C

Results of analytical investigations to develop, understand, and evaluate potential helicopter vibration reduction concepts are presented in the following areas: identification of the fundamental sources of vibratory loads, blade design for low vibration, application of design optimization techniques, active higher harmonic control, blade appended aeromechanical devices, and the prediction of vibratory airloads. Primary sources of vibration are identified for a selected four-bladed articulated rotor operating in high speed level flight. The application of analytical design procedures and optimization techniques are shown to have the potential for establishing reduced vibration blade designs through variations in blade mass and stiffness distributions, and chordwise center-of-gravity location.

R. W. LEVINGE Jul. 1985 60 p
(AEL-0242-TM; AR-004-156) Avail: NTIS HC A04/MF A01

The possibility of flutter induced by a store carried under the wing of an aircraft is investigated. This involves in-flight dynamic analysis of structural deformations at given points on an airframe due to forces originating in the store. A system of rotating eccentric masses generates a force spectrum 2.4 to 20.0 Hz in both horizontal and vertical axes. Electronically controlled, the Flutter Generator runs for 28 s with a swept frequency of force is computed continuously and telemetered to ground as an analogue signal.

**PREDICTION OF WING AEROELASTIC EFFECTS ON AIRCRAFT LIFT AND PITCHING MOMENT CHARACTERISTICS**

C. V. ECKSTROM Nov. 1985 22 p refs Presented at the Aircraft Flight Loads Technology Transfer Conference, Washington, D.C., 16-17 Oct. 1985
(NASA-TM-87631; NAS 1.15:87631) Avail: NTIS HC A02/MF A01 CSCL 01C

The distribution of flight loads on an aircraft structure determines the lift and pitching moment characteristics of the aircraft. When the load distribution changes due to the aeroelastic response of the structure, the lift and pitching moment characteristics also change. Some estimate of the effect of aeroelasticity on stability and control characteristics, particularly lift and pitching moment, is required for use in aircraft simulation models for evaluation of flight characteristics. This presentation outlines a procedure to incorporate aeroelastic effects into lift and pitching moment data from wind tunnel tests. Results are presented which were obtained from applying this procedure to an aircraft with a very flexible transport-type research wing. The procedure described is generally applicable to all types of aircraft.

This report documents the PIFCGT computer program. In FORTRAN, PIFCGT is a computer design aid for determing Proportional-Integral-Filter (PIF) control laws for aircraft autopilots implemented with a Command Generator Tracker (CGT). The program uses Linear-Quadratic-Regulator synthesis algorithms to determine feedback gains, and includes software to solve the feedforward matrix equation which is useful in determining the command generator tracker feedforward gains. The program accepts aerodynamic stability derivatives and computes the corresponding aerodynamic linear model. The nine autopilot modes that can be designed include four maneuver modes (ROLL SEL, PITCH SEL, HDG SEL, ALT SEL), four final approach models (APR GS, APR LOCI, APR LOCR, APR LOCP), and a BETA HOLD mode. The program has been compiled and executed on a CDC computer.

**USE OF HINGED STRAKES FOR LATERAL CONTROL AT HIGH ANGLES OF ATTACK M.S. Thesis**

R. E. ERB May 1985 164 p
(AD-A158005; AFIT/CI/NR-85-61T) Avail: NTIS HC A08/MF A01 CSCL 20D

This thesis investigated the feasibility of using a portion of the leading edge (LE) strake hinged along the longitudinal axis as a roll control device for a high performance aircraft at high angles of attack (AOA). A wind tunnel test was conducted to gather static force and moment data for use in a six degree of freedom computer simulation. Asymmetric strake deflections, both dihedral and anhedral, were investigated. The longitudinal coefficients were little affected by strake deflection, but the lateral directional coefficients showed a nonlinear, but repeatable, behavior with strake deflection. Comparisons to be published data indicate that the strakes produce similar behavior for different aircraft designs. Simulations of the aircraft response to the strakes showed that an improvement over current roll performance could be obtained by combining the positive strake deflection with the ailerons up to 38 deg. AOA, after which the strakes alone produced the best roll performance. Sideslip and AOA must be closely controlled or the aircraft will either not roll, or will depart during the roll. The roll performance using hinged strakes at high AOA is compared to roll performance using differential (LE) flaps. The diffential LE flaps produce comparable roll rates with less sideslip than produced by the hinged strakes. However, the possibility exists of combining hinged strakes with differential (LE) flaps for improved roll performance.

CSCL 09B

This final report describes an exploratory development effort for the design and fabrication of a digital servocontroller system for load control in full-scale air-frame fatigue tests. Each digital controller replaces four analog controllers. The LSI-11/23 microcomputer in the digital controller executes a PI algorithm to implement direct digital control. It may operate in a stand-alone mode or as a slave processor to a master computer via fiber optic link. Other programmable features specifying loop parameters, building load profiles, adjusting control system gains and monitoring alarm and abort conditions. GRA

**APPLICATION OF MECHANICS TO FLIGHT-SIMULATOR PROBLEMS [APLIKACE MECHANIKY V PROBLEMATICE LETOVYCH SIMULATORU]**
K. JANSA Zpravodaj VZLU (ISSN 0044-5355), no. 1, 1985, p. 25-29. In Czech.

The concepts of aircraft flight simulation and of the flight simulator are briefly explained. The main components of a simulator are described, and the current state of flight-simulation technology in Czechoslovakia is reviewed. The functions and operating principles of the main components and systems of flight simulators are described, and the application of mechanics to the solution of problems associated with their development is discussed. B.J.

**A REVIEW OF ADAPTIVE WALL WIND TUNNELS**
U. GANZER (Berlin, Technische Universitaet, West Germany) Progress in Aerospace Sciences (ISSN 0376-0421), vol. 22, no. 2, 1985, p. 81-111. refs

A brief outline is given of the adaptive wall concept. This is followed by a detailed description of the research facilities used to explore the concept. For tests of aerofoils, facilities with two adaptive walls are shown to yield results of very high quality. Wall adaptation was achieved even for fairly high subsonic Mach numbers. For tests of three-dimensional models, first results give hope that for subsonic flow the use of only two adaptive walls may be sufficient to reduce the wall interference to an acceptable level. On the other hand, test sections with three-dimensional adaptive walls have been employed successfully at subsonic main stream condition. Experimental results for low supersonic speeds are not yet available. From theoretical considerations, however, it can be expected that with three-dimensional adaptive walls one can achieve acceptably small wall interferences at low supersonic speeds. Author

**HOVERING MODEL HELICOPTER ROTOR TESTING**
R. A. PIZIALI and F. F. FELKER, III (NASA, Ames Research Center; U.S. Army, Aeromechanics Laboratory, Moffett Field, CA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 7 p.

A relatively large test chamber, chosen to minimize room interference effects during helicopter hovering rotor tests, was found in initial operations to exhibit large, random variations of thrust, torque, and blade flapping. The source of these problems, unsteady recirculation of test chamber flow, was addressed by the addition of a 'flow straightener' that reduced these parameter variations to 1.5 percent of mean values. Rotor performance was then measured outside the chamber in calm, free air conditions and compared with chamber results obtained before and after modifications. Attention is given to wake flow visualization conducted in the test chamber, as well as outside. O.C.

**MODIFICATION TO THE NASA LANGLEY 4- BY 7-METER TUNNEL FOR IMPROVED ROTORCRAFT AERODYNAMICS AND ACOUSTICS**
Z. T. APPLIN (NASA, Langley Research Center, Hampton, VA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 10 p. refs

Investigations have been conducted with the aim of improving circuit mean flow characteristics and test section turbulence intensity in the NASA Langley 4 x 7-m wind tunnel. Flow deflectors were instaled to displace the airstream and provide more symmetrical velocity distributions. The periodic flow pulsations of the open test section configuration were addressed by modifications of either the test section entrance, using triangular vanes, or the test section exit, using an alternative flow collector geometry; the latter proved more effective. O.C.

**THE WIND TUNNEL AS A DESIGN TOOL**
D. BEVAN and E. J. PYNE (Boeing Vertol Co., Philadelphia, PA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 8 p.

Wind tunnels intended for use as rotorcraft design tools are noted, in view of a major helicopter manufacturer's experience, to require aircraft models that are sufficiently large for the incorporation of Mach-scaled and instrumented rotor blades, as well as a test section sufficiently wide to accept such rotors. Large power supplies and small electric, hydraulic and pneumatic power systems must be used for main rotor and tail rotor drives, control system actuation, drivetrain lubrication, and cooling. Also required are instrumentation and calibration facilities for the maintenance of models with as many as 100 channels; data acquisition and computation systems should be readily modifiable. O.C.

**METHODS OF FULL SCALE FATIGUE TESTING THE APACHE HELICOPTER ROTOR SYSTEMS**

G. J. KORKOSZ (Hughes Helicopters, Inc., Technology Dept., Culver City, CA) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 9-1 to 9-20.

Attention is given to the test methods and fixturing appratus that were developed for full scale fatigue tests of the YAH-64 military helicopter main rotor system's retention characteristics and root-end fatigue, as well as the tail rotor blade/hub assembly's fatigue. The selection of mechanical (electrohydraulic and pneumatic) loading and reacting components for these tests is discussed. Test parameters encompassed tension, torsion, coning, feathering, flapping, flapwise bending, feathering moment, lead-lag load, and chordwise shear. O.C.

**A RIG FOR THE FATIGUE TESTING OF ROTOR HUBS**

G. GRANGER, JR. and R. MAYERJAK (Kaman Aerospace Corp., Bloomfield, CT) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 11-1 to 11-15.
(Contract N00019-82-G-0107)

A rig is described for the fatigue testing of a full-scale main rotor hub. The load paths within the rig are compact, direct, and self-reacting. As a consequence, the rig is small and portable. Its main framework is an open pyramid that is constructed of welded steel plates and rolled sections. The rig is capable of applying significant loads. In current tests of a full-scale rotor hub, the loadings include: centrifugal force = 102,000 lbs; torque = 426,000 inch-lbs; lift = 16,100 lbs; and hub moment = + or - 265,000 inch-lbs. The loads are generated by hydraulic cylinders. The equipment for controlling, measuring, and recording loads is described. In general, such equipment is not dedicated solely to hub testing, but rather is transferable to other projects when not in use for hub testing. It is concluded that the new rig offers a practical, inexpensive method for the fatigue testing of full-scale rotor hubs. Author

**FATIGUE TEST OF THE APACHE AH-64 AIRFRAME**

G. D. DEVEAUX and A. W. MAGULA (Hughes Helicopters, Inc., Culver City, CA) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 12-1 to 12-26.

A fatigue test program of the AH-64 Apache Static Test Airframe is described. In place of the complete airframe being subjected to a spectrum of flight maneuver test conditions, a series of component airframe tests were performed. S-N and spectrum fatigue test data were obtained on selected airframe components, the airframe structure adjacent to these components, and the attachments joining the components to the structure. This series of airframe component tests demonstrated compliance with acceptance limits of acquiring sufficient S-N data to define S-N curves and block spectrum testing to substantiate design fatigue life capability. Of noteworthy interest is that prior to this test program, this airframe was subjected to static limit and ultimate flight and landing load conditions. Author

**WIDE-ANGLE, LOW-ALTITUDE FLIGHT SIMULATOR VISION SYSTEM FOR COCKPIT RESEARCH AND AIRCREW TRAINING**

A. CORT and R. HAWTIN (Westland Helicopters, Ltd., Yeovil, England) IN: Specialists' Meeting on Advanced Cockpit Design, Grapevine, TX, October 3, 4, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 13 p.

'Vistasim' is a low altitude flight simulator for training and operational research whose configuration features a flexible transparency that travels continuously in a roll-wound loop. With normal flight planning, flights of several miles can be undertaken before the scene is represented. A laser light source is used that allows flight to altitudes as low as the ground to be simulated. A parallel action linkage and gimbals system is used to move the transparency in pitch and roll. O.C.

**AIRCRAFT COMPARTMENT PREHEATING DEVICE LUVO 100 [LUFTFAHRZEUGKABINENVORWAERMGERAET LUVO 100]**

K. EPPERLEIN (Interflug Gesellschaft fuer Internationalen Flugverkehr mbH, Berlin, East Germany) Technisch-Oekonomische Information der zivilen Luftfahrt (ISSN 0232-5012), vol. 21, no. 5, 1985, p. 167, 168. In German.

The present article is concerned with a preheating device which has been developed for the airline Interflug. At the airport Berlin-Schoenefeld, the preheating of the aircraft compartments is generally accomplished with the aid of special preheating devices. Advantages of a ground-based climatization procedure are related to lower cost and better environmental conditions. The ground-based preheating devices which are currently employed by Interflug provide heat through the compartment doors and consume much energy. There are also certain restrictions with respect to the employment of these devices. Because of this situation, it became necessary to develop an aircraft compartment preheating device which is free of the considered disadvantages. An important aspect is the possibility of an employment of the preheater in the aircraft types IL-62, Tu-134, and IL-18. The characteristics of the LUVO 100 are discussed together with information regarding its performance. G.R.

An improved compact design for a superconducting magnetic suspension and balance system for an 8 ft. x 8 ft. transonic wind tunnel is developed. The original design of an MSBS in NASA Cr-3802 utilized 14 external superconductive coils and a superconductive solenoid in the airplane test model suspended in a wind tunnel. The improvements are in the following areas: test model solenoid options, dynamic force limits on the model, magnet cooling options, structure and cryogenic designs, power supply specifications, and cost and performance evaluations. The improvements are: MSBS cost reduction of 28%, weight; reduction of 43%, magnet system ampere-meter reduction of 38%, helium liquifier capacity reduction by 33%, magnet system stored energy reduction by 55%, AC loss to liquid helium reduced by 76%, system power supply reduced by 68%, test coil pole strength increased by 19%, wing magnetization increased by 40%, and control frequency limit increased by 200% from 10 Hz to 30 Hz. The improvements are due to: magnetic holmium coil forms in the test model, better rare earth permanent magnets in the wings, fiberglass-epoxy structure replacing stainless steel, better coil configuration, and new saddle roll coil design. CSCL 06P

Accommodation and binocular vergence were measured using a haploscope optometer for 10 observers who viewed collimated (0.15 diopter) and noncollimated presentations of a simulated approach and landing. Collimated imagery produced a small but consistent decrease in accommodation for each observer (M = 12.7 meters). Collimation also produced an increase in the perceived size of objects within the visual scene. These results suggest that the primary influence of collimation is on binocular vergence and that differences in the perceived quality of collimated and noncollimated simulator displays are due to differences in binocular vergence rather than in accommodation. **CONFIGURATION AND LONGITUDINAL WIND TUNNEL TESTING]HY] OF FORWARD-SWEPT WINGS**
W. YE and R. XIAO *In its* China Report: Science and Technology (JPRS-CST-85-036) p 80-90 23 Oct. 1985 refs Transl. into ENGLISH from Kongqidonglixue Xuebao (Mianyang, China), no. 2, Jun. 1985 p 61-68
Avail: NTIS HC A07/MF A01

Based on low-speed wind tunnel testing, calculation of load distribution and the transonic-supersonic area rule, the aerodynamic characteristics of aircraft with a configuration of forward-swept wings (FSW) are analyzed. Measures for improving the aerodynamic characteristics of FSW are suggested. The principle of symmetry is used to solve problems related to the application of the area eddy method and the area rule calculation method for FSW. The experimental research and calculations show that FSW have rather good aerodynamic characteristics and that a winglet at the wing tip can improve the lift and lift-drag ratios FSW. FSW more closely approximate an optimum load distribution than do aft-swept wings (ASW). There are obvious improvements in airflow separation at the FSW base from using a close-coupled canard and a fairing panel at the wing base. FSW more closely approximate an optimum load distribution than do ASW. The axial cross-sectional load distribution on an FSW with a canard more easily approximates an optimum load distribution and thereby can result in an obvious reduction in zero-lift wave drag. **AN ANALYSIS OF CROSS-COUPLING OF A MULTICOMPONENT JET ENGINE TEST STAND USING FINITE ELEMENT MODELING TECHNIQUES Final Report**
W. G. SCHWEIKHARD and W. N. SINGNOI 1985 55 p refs
(Contract NAG3-85)
(NASA-CR-176424; NAS 1.26:176424) Avail: NTIS HC A04/MF A01 CSCL 14B

A two axis thrust measuring system was analyzed by using a finite a element computer program to determine the sensitivities of the thrust vectoring nozzle system to misalignment of the load cells and applied loads, and the stiffness of the structural members. Three models were evaluated: (1) the basic measuring element and its internal calibration load cells; (2) the basic measuring element and its external load calibration equipment; and (3) the basic measuring element, external calibration load frame and the altitude facility support structure. Alignment of calibration loads was the greatest source of error for multiaxis thrust measuring systems. Uniform increases or decreases in stiffness of the members, which might be caused by the selection of the materials, have little effect on the accuracy of the measurements. It is found that the POLO-FINITE program is a viable tool for designing and analyzing multiaxis thrust measurement systems. The response of the test stand to step inputs that might be encountered with thrust vectoring tests was determined. The dynamic analysis show a potential problem for measuring the dynamic response characteristics of thrust vectoring systems because of the inherently light damping of the test stand. E.A.K.

**CONCEPTS FOR THE DEVELOPMENT OF A NONDESTRUCTIVE TESTING AND EVALUATION SYSTEM FOR RIGID AIRFIELD PAVEMENTS Ph.D. Thesis**
P. T. FOXWORTHY 1985 274 p
(AD-A158004; AFIT/CI/NR-85-93T) Avail: NTIS HC A12/MF A01 CSCL 13B

This thesis develops a complete system for nondestructive testing and evaluation of rigid airfield pavements. An extensive review of present destructive and nondestructive equipment and methodologies is made to form the basis for selection of the equipment and analytical model used in this research. A brief description of the selected Dynatest Model 8000 Falling Weight Deflectometer and the ILLISLAB finite element computer model is presented. Three Air Force installations were chosen for in-depth study of pavement response to FWD loads under a variety of environmental and geological conditions. Techniques are presented to determine the location of maximum damage to rigid pavement slabs for one or any combination of aircraft, and the validity of the calculated stresses is established through comparisons of measured and predicted deflections at joints. Major study findings include: (1) new designations for pavement features based on actual loading conditions, (2) guidelines for planning and conducting large scale evaluations of major airfield systems, (3) a computer-based determination of E and K, (4) joint behavior prediction under fluctuating temperatures and their effect on generated slab stresses, (5) procedures to account for the annual distribution of traffic over the range of temperatures normally experienced at any facility, (6) a simplistic means of estimating total past damage from aircraft operations, and (7) development of computer programs to predict remaining structural life of rigid airfield pavements. **PROGRAMMING A MULTIPLE-ORIFICE HYDRAULIC DECELERATOR Final Report, Mar. 1978 - Feb. 1985**
C. G. TOLER Jun. 1985 30 p
(Contract AF PROJ. 7231)
(AD-A159428; AAMRL-TR-85-049) Avail: NTIS HC A03/MF A01 CSCL 14B

The AAMRL Horizontal Deceleration Facility is used to conduct experimental research for the development of design criteria for aircrew personnel protection. The hydraulic deceleration device is a water-filled cylinder. A piston mounted on the front of a deceleration sled ruptures a frangible diaphragm positioned at the opening of the cylinder and displaces the water in the cylinder through the multiple orifices. As the piston travels along the cylinder it closes off the orifices thereby decreasing the available area for the water to escape. Bernoulli's conservation-of-energy equation was applied to the physical state of fluid flow in the cylinder, allowing the orifice area to be determined as a function of the piston cross-sectional area, acceleration, velocity and weight of the sled. A computer program was developed to determine the appropriate plug orifice and location to produce desired acceleration-time profiles. The program corrects for the energy loss due to the vena contracta of each plug. Data from several tests were used to determine a correction coefficient for other losses, such as those attributable to conduit length and surface roughness, as a lumped quantity. Author (GRA)

**STABILITY OF LARGE DAMPED FLEXIBLE SPACECRAFT WITH STORED ANGULAR MOMENTUM**

P. K. MAHARANA and S. K. SHRIVASTAVA (Indian Institute of Science, Bangalore, India) Acta Astronautica (ISSN 0094-5765), vol. 12, Nov. 1985, p. 889-898. refs

The vibrational stability of large flexible structurally damped spacecraft carrying angular momentum and undergoing large rigid body rotations is studied theoretically. Analytical solutions to the motion of rigid gyrostats under torque free conditions are developed which serve as a generalization of existing solutions. Differential equations having constant or periodic coefficients for the structural vibration of the spacecraft, are obtained and Floquet theory is applied to determine the stability of the periodic differential equations. Analysis of a few beam-like and plate-like configurations indicate that the introduction of a single reaction wheel into an axisymmetric satellite does not alter the stability criterion. However, introduction of constant speed rotors deteriorates vibrational stability. I.H.

**AN ANALYTICAL MODULARIZED TREATMENT OF AUTOPILOTS FOR GUIDED PROJECTILE SIMULATIONS**

E. M. FRIEDMAN and M. J. AMORUSO Aug. 1985 42 p (AD-A159311; AD-E401390; ARLCD-TR-85025; Avail: NTIS HC A03/MF A01 CSCL 19A

An innovative technique was developed by which piecewise analytical solutions to guidance and control transfer functions were obtained for use in larger but lower frequency computer simulations of guided munitions. Numerical integration, which is typically used to treat such transfer functions, significantly reduces the integration time step, and increases computer execution time for the overall simulation. The modularized analytical approach accommodates integration time steps associated with the lower frequencies of airframe dynamics which results in faster simulation execution and considerable savings in cost and execution time. **CARBON FIBRES: USES AND PROSPECTS; PROCEEDINGS OF THE THIRD INTERNATIONAL CONFERENCE, LONDON, ENGLAND, OCTOBER 8-10, 1985**

Conference sponsored by the Plastics and Rubber Institute. London, Plastics and Rubber Institute, 1985, 189 p. For individual items see A86-16202 to A86-16209.

Among the topics discussed are manufacturing advancements toward higher strain carbon fibers, the comparative performance of commercially available carbon fibers, woven carbon fiber-reinforced plastic (CFRP) fabrics, the use of carbon fiber-based papers as a sheet reinforcement material, metal-coated carbon fibers for conductive composites, and the development prospects for carbon fiber-reinforced molding compounds and thermoplastics. Also covered are major CFRP civil aircraft components, CFRP helicopter structures, matrix systems for high performance airframe structures, CFRP parts integration advantages and problems, carbon fiber-reinforced coil springs, composite materials in racing car design, carbon fiber reinforcement applications in sports equipment and marine systems, and CFRP medical prosthesis development. A final section is devoted to carbon/carbon composite developments and hybrid fiber-reinforced composite systems. O.C.

**MANUFACTURING ADVANCE TOWARDS HIGH STRAIN FIBERS**

Y. IZUKA, T. NORITA, T. NISHIMURA (Toray Industries Inc., Tokyo, Japan), and K. FUJISAWA (Toray Europe, Ltd., London, England) IN: Carbon fibres: Uses and prospects; Proceedings of the Third International Conference, London, England, October 8-10, 1985 . London, Plastics and Rubber Institute, 1985, p. 2/1-2/15. refs

In order to fulfill aircraft primary structure composite requirements, such high strength/modulus carbon fibers as T800 and T400 have been developed. Composites employing the former yield 20 percent higher tensile and compressive modulus, and 60-80 percent higher tensile strength, than T300 fiber-based composites. Penetration impact loads are, moreover, doubled. The compressive and transverse tensile strengths of the T800-reinforced composite do not, however, reflect the improvement of fiber properties. O.C.

**INTERLEAF TECHNOLOGY FOR CARBON COMPOSITE AIRCRAFT PRIMARY STRUCTURE**

R. B. KRIEGER, JR. (American Cyanamid Co., Teterboro, NJ) IN: Carbon fibres: Uses and prospects; Proceedings of the Third International Conference, London, England, October 8-10, 1985 . London, Plastics and Rubber Institute, 1985, p. 23/1-23/12.

Carbon fiber composites can save weight over aluminum in aircraft structure. This savings could be magnified if the composite were 'tougher', i.e., more tolerant of damage and stress concentration. To accomplish this, the Interleaf Concept has been developed. A thin, high elongation, resin interleaf is placed between each fiber ply to provide toughness. Each ply has its fibers in an epoxy matrix for high hot-wet performance. The two resins remain discrete during cure and so interleaf toughness does not compromise matrix hot-wet compression strength. Author

**DYNAMIC THERMAL ANALYSIS CHARACTERIZATIONS OF ELECTRON-BEAM CURED ADHESIVES**

F. J. CAMPBELL (U.S. Navy, Naval Research Laboratory, Washington, DC) IN: Adhesive chemistry: Developments and trends . New York, Plenum Press, 1984, p. 379-391. Navy-supported research. refs

Continuous scans of modulus versus temperature utilizing the DuPont Dynamic Mechanical Analyzer (DMA) has provided a comparison of the high temperature service capabilities of radiation-cured experimental formulations of a vinyl-modified epoxy resin, Shell Epocryl-12. These scans were compared to data obtained when the same materials were applied as adhesives on aluminum test panels, radiation-cured with an electron beam, and lap shear strength tested at discrete temperatures. The DMA instrument utilizes a thin rectangular specimen for the analysis, so specimens can be cut from blocks or from flat sheets. In this case the sepcimens were cured as sheets of resin-saturated graphite-fibers. The same order of high temperature stability was obtained by each method. However, the DMA method provided a more complete chracterization of temperature performance in a much shorter test time and thus, it can be very useful for quick analyses of formulation and processing variables in many types of materials optimization studies. The paper will present details of this study with illustrations of the comparisons. Author

### THERMAL BARRIER COATINGS FOR JET ENGINE IMPROVEMENT

G. JOHNER and K. K. SCHWEITZER (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) IN: Metallurgical coatings 1984; Proceedings of the Eleventh International Conference, San Diego, CA, April 9-13, 1984. Volume 2 . Lausanne, Switzerland, Elsevier Sequoia, S.A., 1984, p. 301-315. refs

The aim of these investigations is to develop thermal barrier coatings (TBCs) with improved resistance against thermal cycling to prevent problems of over-heating in the hot section of jet engines. Plasma-sprayed TBCs consisting of an Ni-Cr-Al bond coat and zirconia overlayer stabilized with different materials (CaO, MgO or Y2O3) were tested in a burner rig under thermocyclic conditions, in a hot gas centrifugal rig and in a modern jet engine. These tests demonstrate good correlation between the failure mode of the coatings in the thermocyclic tests and in engine tests. The best performance in all tests was shown by zirconia partially stabilized with yttria according to microanalytical investigations of the unstresed and stressed TBCs. Furthermore, heat treatments as well as ongoing optimization of the spraying parameters of the TBCs demonstrate potential improvement. Author

### THE TEMPERATURE DEPENDENCE OF THE ELECTRICAL CONDUCTIVITY OF JET FUELS WITH ANTISTATIC ADDITIVES [ZAVISIMOST' ELEKTROPROVODIMOSTI REAKTIVNYKH TOPLIV S ANTISTATICHESKIMI PRISADKAMI OT TEMPERATURY]

A. I. BELOUSOV and E. M. BUSHUEVA (Vsesoiuznyi Nauchno-Issledovatel'skii Institut Neftianoi Promyshlennost', Moscow, USSR) Khimiia i Tekhnologiia Topliv i Masel (ISSN 0023-1169), no. 10, 1985, p. 26-28. In Russian. refs

A study is made of the temperature dependence of the electrical conductivity of jet fuels with Soviet-made (Sigbal and ASP-1) and foreign (ASA-3 and Kerostat) antistatic additives. An analysis of the results obtained shows that the change of the electrical conductivity of such fuels with temperature is largely determined by the additive. The smallest change of electrical conductivity (1.3 percent per 1 C) is observed for fuels containing the antistatic additive Sigbol. V.L.

### STRUCTURAL MATERIALS IN AERONAUTICS - PROSPECTS AND PERSPECTIVES

G. G. POPE (Royal Aircraft Establishment, Farnborough, England) Zeitschrift fuer Flugwissenschaften und Weltraumforschung (ISSN 0342-068X), vol. 9, Sept.-Oct. 1985, p. 269-283. refs

Recent developments in materials and their prospects for application in airframes and engines are reviewed, with particular attention paid to advances in the U.K. Some of the more important considerations that arise when selecting material for use in airframes and aeroengines are summarized. The merits of composites, titanium alloys, steels, aluminum alloys, and gas turbine materials are discussed in detail. It is concluded that new materials will be acceptable only if a clear understanding is achieved of the relationship between composition, microstructure and material behavior, the manufacturing route, and the quality control of the product. ### ROLE OF DISPERSED OXIDES IN REDUCING SUBSTRATE/COATING INTERDIFFUSION

K. L. LUTHRA (General Electric Co., Schenectady, NY) Journal of Vacuum Science and Technology A (ISSN 0734-2101), vol. 3, Nov.-Dec. 1985, p. 2574-2577. refs

Theoretical calculations have been performed to evaluate the usefulness of dispersed oxides in a barrier layer in reducing substrate/coating interdiffusion. The important variables influencing interdiffusion are (1) the ratio of the thickness of the barrier layer to the total coating, (2) the volume fraction of oxides in the barrier layer, and (3) a tortuosity factor that depends on the distribution of oxides in the barrier layer. The results of calculations suggest that it may be possible to increase the operating life by a factor of up to about 2.5 or increase the operating temperature by a maximum of about 75 C in systems where life is limited by substrate/coating interdiffusion. ### GENERIC ASPECTS OF DELAMINATION IN FATIGUE OF COMPOSITE MATERIALS

T. K. OBRIEN (U.S. Army Structures Laboratory, Hampton, VA) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 2-1 to 2-5. refs

A review of recent work characterizing composite delamination failure in fatigue is presented. Results from tensile fatigue tests on unnotched laminates are high-lighted to demonstrate the influence of delamination on stiffness, strength, and life. The use of fracture mechanics to achieve a generic characterization of delamination is demonstrated. A fatigue design philosophy is proposed based on an understanding of composite delamination behavior. Author

### INTERPRETATION AND EVALUATION OF FATIGUE PROPERTIES OF CAST, HIP AND HEAT TREATED TITANIUM UH-60A M. R. HUB

C. MATUSOVICH and M. M. SCHWARTZ (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 4-1 to 4-22.
(Contract DAAO46-79-C-0043)

Attention is given to the methodology and results of the third phase of a U.S. Army program evaluating the static, fatigue and fracture toughness properties of rammed graphite-cast Ti-6Al-4V material for helicopter main rotor hubs that are subsequently HIPped and beta-STOA processed. Ultimate tensile and yield strengths, elongation, area reduction, and S-N curve shapes were obtained. The typical mean fatigue strength of the cast material was comparable to that of conventionally forged beta-STOA production hubs' material; a higher degree of scatter in the castings-derived data than in that for forgings is, however, noted and discussed. O.C.

### FULL SCLE FATIGUE TESTING OF ADVANCED FIBER COMPOSITE COMPONENTS

D. O. ADAMS and H. L. KEARNEY (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 7-1 to 7-15.

The importance of full-scale testing in the development process for fiber-reinforced composite helicopter dynamic components is discussed, and illustrated by means of several examples drawn from Sikorsky experience in the use of composites in a wide variety of structural applications. Laboratory fatigue testing is conducted at Sikorsky on all flight-critical dynamic components in order to determine structural adequacy. The intention of this testing is to generate fracture modes by testing with loads accelerated above the levels encountered in service. The fracture mechanisms exposed to date in this testing on composite components have not been fiber-related, but rather matrix-related (interlaminar shear or disbond). These fracture mechanisms are related to design details such as ply endings, holes, curved sections, bonded joints, or bolted joints. Test methods and fracture mechanisms for the following components are discussed: Cross Beam Tail Rotor Spars, Main Rotor Blades, UH-60A External Stores Support and S-76 stabilizer. Structural analysis of these components and fracture modes is not presented since the primary mechanism - interlaminar shear is difficult to treat analytically. This emphasizes the importance of the empirical approach as a necessary complement to analysis in the development of critical composite components used in fatigue loaded applications. Author

**FAILURE MECHANISMS OF LAMINATES TRANSVERSELY LOADED BY BOLT PUSH-THROUGH**

W. A. WATERS, JR. (Kentron International Inc., Hampton, Va.) and J. G. WILLIAMS Sep. 1985 26 p refs
(NASA-TM-87603; NAS 1.15:87603) Avail: NTIS HC A03/MF A01 CSCL 11D

Stiffened composite panels proposed for fuselage and wing design utilize a variety of stiffener-to-skin attachment concepts including mechanical fasteners. The attachment concept is an important factor influencing the panel's strength and can govern its performance following local damage. Mechanical fasteners can be an effective method for preventing stiffener-skin separation. One potential failure mode for bolted panels occurs when the bolts pull through the stiffener attachment flange or skin. The resulting loss of support by the skin to the stiffener and by the stiffener to the skin can result in local buckling and subsequent panel collapse. The characteristic failure modes associated with bolt push-through failure are described and the results of a parametric study of the effects that different material systems, boundary conditions, and laminates have on the forces and displacements required to cause damage and bolt pushthrough failure are presented. **FLIGHT SERVICE EVALUATION OF ADVANCED COMPOSITE AILERONS ON THE L-1011 TRANSPORT AIRCRAFT Annual Flight Service Report, Jul. 1984 - Jun. 1985**

R. H. STONE Jul. 1985 10 p refs
(Contract NAS1-15069)
(NASA-CR-177960; NAS 1.26:177960; LR-30904; AFSR-3)
Avail: NTIS HC A02/MF A01 CSCL 11D

Flight service evaluation of composite inboard ailerons on the L-1011 under Contract NAS 1-15069 for a period of five years is discussed. The period from July 1984, when the second yearly inspections were completed, through June 1985 is covered. Four shipsets of graphite/epoxy composite inboard ailerons were installed on L-1011 aircraft for this maintenance evaluation program. These include two Delta aircraft and two TWA aircraft. A fifth shipset of composite ailerons were installed in 1980 on Lockheed's flight test L-1011. This aircraft is now inactive and inspections were therefore not performed this year. No visible damage was observed on any of the composite ailerons, and no maintenance action has occurred on any of the composite parts except for repainting of areas with paint loss. Flight hours on the airline components at the time of inspection ranged from 8767 to 10,804 hours, after approximately 3 years of service. Author

**FURFURYL ALCOHOL POLYMER CONCRETES FOR USE IN ALL-WEATHER REPAIRS OF CONCRETE AND ASPHALT SURFACES**

L. E. KUKACKA and T. SUGAMA Apr. 1985 26 p Presented at the American Concrete Institute Fall Meeting on Polymers in Concrete, Chicago, Illinois, 3 Oct. 1985
(Contract DE-AC02-76CH-00016)
(DE85-014825; BNL-36465; CONF-851[illegible]115-1) Avail: NTIS HC A03/MF A01

The following criteria were established: high strength at an age of 1 h, placement of the materials must be possible during heavy precipitation over temperatures ranging from -32 to 52 C, and the chemical constituents should be low cost and have long-term stability when contained in a maximum of three packages during storage. A formulation consisting of furfuryl alcohol monomer (FA), (ALPHA), (ALPHA), (ALPHA) - trichlorotoluene, pyridine, silane, zinc chloride, silica filler, and coarse aggregate meets these requirements. Optimized formulations were established for use with premixed and percolation placement methods. The premixed formulation is compatible with moisture contents up to 4% by weight of the total mass, which simulates placement in a 2.54 cm/h rainfall. The working time for the FA-PC slurry can be controlled at greater than or equal to 15 min over the entire operating temperature range by simply varying the (ALPHA), (ALPHA), (ALPHA)-trichlorotoluene catalyst concentration while holding all of the other constituents constant. Prototype equipment for the mixing and placement of FA-PC was demonstrated: a concrete transit mix supply of mixed aggregate, a hopper-fed volumetric feed screw which supplied aggregate at a known rate to a mixing screw, and a monomer pump and spray nozzle. **DEVELOPMENT OF NEW COMBUSTOR TECHNOLOGIES FOR APPLICATION TO ALTERNATIVE AEROENGINE FUELS, PHASE 1 Final Report, Dec. 1983**

B. SIMON Bonn Bundesministerium fuer Forschung und Technologie Jun. 1985 95 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie
(BMFT-FB-W-85-004; ISSN-0170-1339) Avail: NTIS HC A05/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 20

An air blast fuel injection system for alternative fuels was developed and tested in a reversed flow annular combustion chamber. It was adapted to the boundary conditions of the jet engine (size, form, thermodynamical data). A wall temperature computational program was developed taking into account the impact of the various fuels on the wall temperatures. Recommendations are made for further investigation of an optimal chamber, the introduction of improved cooling techniques, the influence of fuels on the chamber and the application of the air blast injector with alternative flame tube shapes. **EFFECTS OF VIBRATION-INDUCED CAVITATION OF PHYSICOCHEMICAL CHARACTERISTICS OF AIRCRAFT FUEL**

P. P. MERTSALOV, B. G. BEDRIK, and K. L. SUPONKO *In its* USSR Report: Chemistry (JPRS-UCH-85-013) p 46-47 22 Oct. 1985 Transl. into ENGLISH from Khimiya i Tekhnologiya Topliv i Masel (Moscow, USSR), no. 7, Jul. 1985 p 23-25
Avail: NTIS HC A04/MF A01

An analysis was conducted on the factors leading to vibration-induced cavitation in aircraft fuel, resulting from sudden changes in hydrostatic pressure and resultant variability in tensile stresses. The data demonstrates that both hydrodynamic and aircraft factors are predisposed to maximum cavitation in the vibration range of 30 to 300 Hz and vibroacceleration of 10 to 30 g. The specific alterations in fuels TS-1 and T-6 consist of changes in the granulometric profile with an increase in the percentage of particles 1 to 5 micron in size and a decrease in the percentages of those in the 5 to 100 micron (most pronounced with the 15 to 100 micron fraction). Other changes include a decrease in fuel viscosity and thermal stability, and an increase in tar substances. Vibration is, therefore, an important factor to be considered in the formulation and testing of new aviation fuels. Author

**STRESS CONCENTRATION AROUND A SMALL CIRCULAR HOLE IN THE HIMAT COMPOSITE PLATE**

W. L. KO Dec. 1985 18 p refs
(NASA-TM-86038; H-1235; NAS 1.15:86038) Avail: NTIS HC A02/MF A01 CSCL 11D

Anisotropic plate theory is used to calculate the anisotropic stress concentration factors for a composite plate (AS/3501-5 graphite/epoxy composite, single ply or laminated) containing a circular hole. This composite material is used on the highly maneuverable aircraft technology (HiMAT) vehicle. It is found that the anisotropic stress concentration factor could be greater or less than 3 (the stress concentration factor for isotropic materials), and that the locations of the maximum tangential stress points could shift with the change of fiber orientation with respect to the loading axis. The effect of hole size on the stress concentration factor is examined using the Point Stress Criterion and the Averaged Stress Criterion. The predicted stress concentration factors based on the two theories compared fairly well with the measured values for the hole size 0.3175 cm (1/8 in). It is also found that through the lamination process, the stress concentration factor could be reduced drastically, indicating an improvement in structural performance. Author

A continuous inline blender is developed at JPL to blend precisely metered quantities of ICI developed polymer slurries into a stream of Jet-A fuel. The inline blender is used to produce 5 to 10 gallons per minute of freshly blended AMK. The proprietary ICI slurries are made of FM-9 type polymers in a glycol/amine carrier fluid. Depending upon the polymer particle size and powder loading, the slurry consistency ranges from free flowing to a paste with viscosities in the range of 5000 to 100,000 centipoise. With one of the polymer slurries, a provision is made for a time delay between the addition of slurry and the addition of the amine sequentially into the Jet-A stream. Author

This report summarizes qualitative data on the chemical variability of approximately 300 features (chemical components or mixture of components) in neat Air Force distillate fuels, in water equilibrated with the fuels, and in the vapor phase above the fuels, from over 50 fuel sources. These data were obtained to better understand the environmental effects of possible fuel spills and to serve as baseline data which can be used in the development of environmental models for photochemical smog, soot formation from Air Force use of these fuels. Over 50 petroleum-derived JP-4 fuels, one shale-derived JP-4 fuel, and one petroleum-derived JP-5 fuel were analyzed. This report summarizes results for the variability of the major features in water which has been equilibrated with the neat fuels, and in the headspace above the neat fuels. Data base management programs were used to measure feature variability in the data base of over 50 fuels. Feature concentration averages, ranges, standard deviations, and percent relative standard deviations were determined for the 300 features in over 50 fuels, analyzed in duplicate. The variability of data acquisition and data analysis phases of the study was also assessed by calculating the averages, ranges, standard deviations, and percent relative standard deviations for the 300 feature concentrations of one JP-4 fuel which was used as the Reference Fuel and analyzed 18 times for water-soluble features and seven times for vapor phase features. The results of tests on how fuel composition affects the performance of three Navy aircraft engine combustors, the TF30, T56, and T53, were analyzed. The objective of this analysis was to identify which fuel property best correlated with the smoke-related measurements: radiation flux, linear temperature rise, smoke number, and smoke emissions. The effects of fuel composition were investigated by using a series of 10 Naval Air Propulsion Center jet fuels with various properties, such as hydrogen contents of 12.83 to 13.82% and total aromatic hydrocarbon contents of 15.9 to 28.5%. Several laboratory combustion characteristics of these fuels were measured and these characteristics were used in analysis. Altogether, 15 fuel parameters were used to correlate the 45 combustor test results. The reported operating conditions of the tests, such as inlet air pressure, inlet air temperature, or fuel/air ratio, were also used as correlating parameters to determine whether variations in these variables, nearly constant for individual tests, also affected the smoke-related test results. GRA

**THE DYNAMICS OF ELASTIC BARS UNDER CONDITIONS OF ARBITRARY KINEMATIC EXCITATION [DINAMIKA UPRUGIKH STERZHNEI PRI PROIZVOL'NOM KINEMATICHESKOM VOZBUZHDENII]**

I. N. GINZBURG (Khar'kovskii Institut Inzhenerov Kommunal'nogo Stroitel'stva, Kharkov, Ukrainian SSR) Problemy Mashinostroeniia (ISSN 0131-2928), no. 22, 1984, p. 28-34. In Russian. refs

Nonlinear differential equations are obtained which describe the relative motion of an elastic bar under arbitrary kinematic excitation of the supporting body. Linear equations of relative motion are integrated for the case of uniform rotation of the supporting body about the axis normal to the guiding plane and for the case of pulsed acceleration. The longitudinal and transverse displacements of the bar are calculated for various angular velocities, pulse lengths, and geometric parameters of the system, and the results are presented in graphic form. V.L.

### EXPERIMENTAL CHARACTERIZATION OF CRACKS AT STRAIGHT ATTACHMENT LUGS

G. NICOLETTO (Bologna, Universita, Italy) Engineering Fracture Mechanics (ISSN 0013-7944), vol. 22, no. 5, 1985, p. 829-838. refs

Lugs are widely used to connect aircraft components. As damage tolerance requirements become increasingly important for design qualification, the cracked-hole problem has received sustained attention because it is the prevalent failure initiation mode of the aircraft industry and lacks an exact stress intensity factor solution. The present work deals with an experimental characterization of cracked lugs, using frozen-stress photoelasticity. Corner, transitioning and through-the-thickness cracks are considered. Experimental stress intensity distributions are presented and discussed in relation to previous studies. Various effects on SIF are assessed. Author

### ATTACHED CAVITATION AND THE BOUNDARY LAYER - EXPERIMENTAL INVESTIGATION AND NUMERICAL TREATMENT

J. P. FRANC and J. M. MICHEL (Grenoble I, Universite, Saint-Martin-d'Heres, France) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 154, May 1985, p. 63-90. refs

(Contract DRET-80-414; DRET-81-513)

Attached cavitation on a wall with continuous curvature is investigated on the basis of experiments carried out on various bodies (circular and elliptic cylinders, NACA 16 012 foil). Visualization of the boundary layer by dye injection at the leading edge shows that a strong interaction exists between attached cavitation and the boundary layer. In particular, it is shown that the cavity does not detach from the body at the minimum pressure point, but behind a laminar separation, even in largely developed cavitating flow. A detachment criterion which takes into account this link between attached cavitation and boundary layer is proposed. It consists of connecting a cavitating potential-flow calculation and a boundary-layer calculation. Among all the theoretically possible detachment points, the actual detachment point is chosen to be the one for which the complete calculation predicts a laminar separation just upstream. This criterion, applied to the NACA foil, leads to a prediction which is in good agreement with experimental results. Author

### LONGITUDINAL VORTICES IMBEDDED IN TURBULENT BOUNDARY LAYERS. I - SINGLE VORTEX

I. M. M. A. SHABAKA, R. D. MEHTA, and P. BRADSHAW (Imperial College of Science and Technology, London, England) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 155, June 1985, p. 37-57. refs

(Contract N00014-78-G-0032; NR PROJECT 061-256)

Detailed mean-flow and turbulence measurements have been made in a low-speed turbulent boundary layer in zero pressure gradient with an isolated, artificially generated vortex imbedded in it. The vortex was generated by a half-delta wing on the floor of the wind-tunnel settling chamber, so that the vortex entering the working section had the circulation as that originally generated, while axial-component velocity variations were very much reduced, relative to the local mean velocity, from values just behind the generator. The measurements show that the circulation around the vortex imbedded in the boundary layer is almost conserved, being reduced only by the spanwise-component surface shear stress. Therefore the region of flow affected by the vortex continues to grow downstream, its cross-sectional dimensions being roughly proportional to the local boundary-layer thickness. The behavior of the various components of eddy viscosity, deduced from measured Reynolds stresses, and of the various triple products, suggests that the simple empirical correlations for these quantities used in present-day turbulence models are not likely to yield flow predictions which are accurate in detail. Author

### A GENERAL PURPOSE, MULTI-STAGE, COMPONENT MODAL SYNTHESIS METHOD

D. N. HERTING (Mac-Neal-Schwendler Corp., Los Angeles, CA) Finite Elements in Analysis and Design (ISSN 0168-874X), vol. 1, Aug. 1985, p. 153-164. refs

A general purpose algorithm for the dynamic analysis of large-order finite element structural models using real modal coordinates is presented. Each component substructure may be formulated to include free or fixed boundary modes, inertia relief displacement shapes, and physical displacements as generalized degrees of freedom. Capabilities are developed for transforming interior loads, such as aerodynamic effects, to the reduced set of coordinates. Theory and tests prove that the method duplicates results from most of the other popular methods by selecting various optional terms. The conclusion contains practical recommendations based upon several applications to structural analysis. Author

**GEAR TOOTH SURFACE FATIGUE TESTING WITH FULL SIZE TEST SPECIMENS**

R. J. DRAGO and H. J. NONEMAKER (Boeing Vertol Co., Philadelphia, PA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 18 p.

Attention is given to the test rig configurations and control and instrumentation systems of a major helicopter manufacturer's Gear Research Test Facility. The approach used at this facility for the surface durability testing of full size spur, helical and spiral bevel gears, in support of a helicopter transmission design effort, is demonstrated. Data analyses yield a mean S/N curve, unbiased standard deviation, and 99-percent confidence limits on the mean curve. O.C.

**A86-18410**

**HELICOPTER DRIVE SYSTEM BENCH TESTING**

D. L. JOHNSON (Bell Helicopter Textron, Inc., Transmission Bench Test Facility, Fort Worth, TX) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 8 p.

Such major helicopter rotor drive system components as gearboxes, driveshafts and masts must be subjected to laboratory development and qualification tests prior to entering service, in order to uncover and eliminate design deficiencies. Endurance and fatigue tests are then conducted to complete the qualification process. Testing takes place in isolated cells, and a computer-controlled data acquisition system monitors test specimen parameters. Power absorption and mechanical and electrical regenerative test stands are used in the cells. O.C.

**A86-18426**

**TESTING LARGE TRANSMISSIONS**

J. C. MACK and R. F. MCCANN (Boeing Vertol Co., Philadelphia, PA) IN: National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, 8 p.

Attention is given to the performance requirements and evaluation procedures that have been devised for large helicopter transmission tests, such as multiplex telemetry systems. Test requirements encompass the investigation of the relationship of tooth contact patterns to their stress fields, as well as the effects of vibratory excitations at operating speed, since undamped, high frequency vibratory forces can severely impact gear integrity. Computer-based data processing shortens the time required for data reduction and improves the accuracy of the results obtained. O.C.

**A86-18431**

**TORSIONAL LOW CYCLE FATIGUE OF SPLINE-ENDED DRIVE COMPONENTS**

C. P. HARDERSEN and T. VOTHANH (Kaman Aerospace Corp., Bloomfield, CT) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 1-1 to 1-16.

Spline-ended joints of three different kinds of steel materials (9315, 4340, 300 maraging) were tested for torsional low cycle fatigue. The experimental data, the S-N curve fitting and the construction method are presented. The noticeable discrepancies between the actual failure modes and the conventional design criteria for splines are observed. Discussions include allowance for scatter, explanation of a typical failure phenomenon, and an attempt at correlating experimental results with torsional fatigue theory, considering fatigue progression under combined bending and torsion. Some recommendations for an improvement of spline design techniques to predict low cycle torsional strength are proposed, mainly in the categories of spline geometry, material choices, and treatment of stress concentration. A design criteria approach is suggested to account for low cycle torsional fatigue in spline-ended joints. Author

**A86-18436**

**ANOTHER LOOK AT GENERALIZED S-N CURVE SHAPES**

C. ALBRECHT (Boeing Vertol Co., Philadelphia, PA) IN: Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings . Alexandria, VA, American Helicopter Society, 1984, p. 6-1 to 6-8. refs

With existing helicopter lifetimes being extended further and further by commercial use, service life extension programs (SLEP) and modernization programs, low-frequency, high-amplitude cyclic loads (GAG-trip cycle) are having an increasing impact on component lives. This is particularly true for drive system components. This paper presents an approach to establish S-N curve shapes, covering the full range of cyclic loading, including GAG-trip cycle loads to be used for the life calculations. Nondimensionalized S-N curves and constant life diagrams are presented for typical helicopter aluminum and steel alloys. The main focus of this paper is to identify a means to permit generation of families of full range S-N curves, using only a limited number of high-cycle fatigue tests. Author

**AN INTRODUCTION TO THE THEORY OF NONLINEAR VIBRATIONS OF AIRCRAFT STRUCTURES [VVEDENIE V TEORIIU NELINEINYKH KOLEBANII AVIAKONSTRUKTSII]**

R. E. LAMPER Moscow, Izdatel'stvo Mashinostroenie, 1985, 88 p. In Russian. refs

The book is concerned with some typical problems encountered in the study of nonlinear vibrations of aircraft structures, such as skin panels, adjustable stabilizer, landing gear struts, and bluff parts of the airframe. Both qualitative methods of analysis on a phase plane and analytical methods are examined. Particular attention is given to small-parameter methods, including the Krylov-Bogoliubskii-Mitropolskii asymptotic method and the Van der Pol method. Finally, the principal characteristics of parametric vibrations are discussed. V.L.

IU. N. ERMAK, N. P. KOLINA, and A. IA. IUSHIN PMTF - Zhurnal Prikladnoi Mekhaniki i Tekhnicheskoi Fiziki (ISSN 0044-4626), Sept.-Oct. 1985, p. 65-69. In Russian. refs

The effect of entropy layer absorption on the aerodynamic heating of a blunt round cone with a half-angle of taper of 10 deg is investigated experimentally and analytically for Mach 6.1 and 8. Similarity parameters are obtained for heat transfer under conditions of entropy layer absorption by a turbulent boundary layer. The experimental and analytical results are processed in terms of similarity parameters for laminar and turbulent boundary layer flows. The results are then used to obtain interpolation formulas for the heat transfer parameter. V.L.

**DEVELOPMENT OF MULTIGRID ALGORITHMS FOR PROBLEMS FROM FLUID DYNAMICS**

K. BECKER and U. TROTTENBERG *In* DGLR The State of Development Research in Numerical Aerodynamics in West Germany p 112-120 1984 refs In GERMAN

Avail: NTIS HC A08/MF A01

Multigrid algorithms are developed to demonstrate multigrid technique efficiency for complicated fluid dynamics problems regarding error reduction and discretization accuracy. Subsonic potential 2-D flow around a profile is studied as well as rotation-symmetric flow in a slot between two rotating spheres and the flow in the combustion chamber of Otto engines. The study of the 2-D subsonic potential flow around a profile with the multigrid algorithm is discussed. Author (ESA)

This report covers work done on the research project Analysis and Computation of Internal Flow Field in a Scramjet Engine. The work is supported by the NASA Langley Research Center (Computational Methods Branch of the High-Speed Aerodynamics Division) through research grant NAG1-423. The governing equations of two-dimensional chemically-reacting flows are presented together with the global two-step chemistry model. The finite-difference algorithm used is illustrated and the method of circumventing the stiffness is discussed. The computer program developed is used to solve two model problems of a premixed chemically-reacting flow. The results obtained are physically reasonable. Author

**NUMERICAL APPROXIMATION OF THE TOTAL DRAG OF A BODY IN A TUBE**

K. C. KAUFMAN 25 Jun. 1985 43 p

(Contract N00024-79-C-6043)

(AD-A159548; ARL/PSU/TM-85-106) Avail: NTIS HC A03/MF A01 CSCL 20D

A study is made of numerical methods to approximate the total drag coefficient of an axisymmetric body in a tube. An analytical relationship for the drag coefficient is obtained via a standard open system control volume analysis. This relationship is found to be difficult to apply numerically using available numerical tools, leading to an approximation of the drag coefficient by neglecting the tube wall skin friction and the pressure distribution across the tube radius near the body tail. The resulting drag coefficient approximation, which accounts for tunnel blockage and horizontal buoyancy effects, is found to provide a good estimate to available experimental data for an unheated body. The approximation makes use of currently available numerical codes for axisymmetric inviscid and boundary layer flow. Numerical obtained drag distributions over a range of Reynolds numbers are compared with experimental drag data for the unheated laminar flow body in the Garfield Thomas 48-inch diameter water tunnel. **FORMATION AND CHARACTERIZATION OF SIMULATED SMALL DROPLET ICING CLOUDS**

R. D. INGEBO Jan. 1986 13 p refs Proposed for presentation at the 24th Aeospace Sciences Meeting, Reno, Nev., 6-8 Jan. 1986; sponsored by AIAA

(NASA-TM-87180; E-2828; NAS 1.15:87180) Avail: NTIS HC A02/MF A01 CSCL 14B

Two pneumatic two-fluid atomizers operating at high liquid and gas pressures produced water sprays that simulated small droplet clouds for use in studying icing effects on aircraft performance. To measure median volume diameter, MVD or D sub v.5, of small droplet water sprays, a scattered-light scanning instrument was developed. Drop size data agreed fairly well with calculated values at water and nitrogen pressures of 60 and 20 psig, respectively, and at water and nitrogen pressures of 250 and 100 psig, respectively, but not very well at intermediate values of water and nitrogen pressure. MVD data were correlated with D sub 0, W sub N, and W sub w, i.e., orifice diameter, nitrogen, and water flowrate, respectively, to give the expression for MVD in microns. Author

**THREE-DIMENSIONAL, TRANSONIC ROTOR FLOW FIELD RECONSTRUCTED FROM HOLOGRAPHIC INTERFEROGRAM DATA**

J. K. KITTLESON, Y. H. YU, and F. BECKER (Max-Planck-Inst. fuer Stroemungsforschung, Goettingen, West Germany) Oct. 1985 21 p refs

(NASA-TM-86816; REPT-85347; NAS 1.15:86816; USAAVSCOM-TR-85-A-10) Avail: NTIS HC A02/MF A01 CSCL 14E

Holographic interferometry and computer-assisted tomography (CAT) are used to determine the transonic flow field of a model rotor blade in hover. A pulsed ruby laser records 40 interferograms with a 61 cm-diam view field near the model rotor-blade tip operating at a tip Mach number of 0.90. After digitizing the interferograms and extracting fringe-order functions, the data are transferred to a CAT code. The CAT code then calculates pressure coefficients in several planes above the blade surface. The values from the holography-CAT method compare favorably with previously obtained numerical computations and laser velocimeter measurements at most locations near the blade tip. The results demonstrate the technique's potential for three-dimensional transonic rotor flow studies. Author

(AD-A158448; STI-TR-1193-1; AFWAL-TR-84-3104) Avail: NTIS HC A07/MF A01 CSCL 01C

This report presents methodologies for the direct digital control of vehicles with flexible modes. The techniques yield robust control system designs with modest or minimal requirements on the number of sensors and control actuators. The digital system techniques used include primarily the w-transforms for direct design and stability assessment, and the hybrid frequency response, for assessment and understanding of digital system peculiarities. The sawtooth Bode is used as the basic control system design concept. These three elements are applied to several examples, including a comprehensive case study for a fighter aircraft flight and flexible mode control system. Both continuous and discrete system designs are considered and the continuous system characteristics are contrasted with an optimal control design. This comparison pinpoints some of the features needed to make optimal control procedures more practical and mature for flexible vehicle control applications. An important step is taken in this direction by determining the nature of performance criteria which yield, for an example case, a highly robust, extremely simple controller derived from an optimal control procedure. (NASA-CR-176415; NAS 1.26:176415) Avail: NTIS HC A04/MF A01 CSCL 20K

Fatigue cracks are a major problem in designing structures subjected to cyclic loading. Cracks frequently occur in structures such as aircraft and spacecraft. The inspection intervals of many aircraft structures are based on crack-propagation lives. Therefore, improved prediction of propagation lives under flight-load conditions (variable-amplitude loading) are needed to provide more realistic design criteria for these structures. The main thrust was to develop a three-dimensional, nonlinear, elastic-plastic, finite element program capable of extending a crack and changing boundary conditions for the model under consideration. The finite-element model is composed of 8-noded (linear-strain) isoparametric elements. In the analysis, the material is assumed to be elastic-perfectly plastic. The cycle stress-strain curve for the material is shown Zienkiewicz's initial-stress method, von Mises's yield criterion, and Drucker's normality condition under small-strain assumptions are used to account for plasticity. The three-dimensional analysis is capable of extending the crack and changing boundary conditions under cyclic loading. Author

**PLANNING, CREATING AND DOCUMENTING A NASTRAN FINITE ELEMENT MODEL OF A MODERN HELICOPTER**
R. GABAL, D. REED, R. RICKS, and W. KESACK *In* NASA. Ames Research Center Rotorcraft Dynamics 1984 p 307-324 Nov. 1985 refs
Avail: NTIS HC A21/MF A01 CSCL 20K

Mathematical models based on the finite element method of structural analysis as embodied in the NASTRAN computer code are widely used by the helicopter industry to calculate static internal loads and vibration of airframe structure. The internal loads are routinely used for sizing structural members. The vibration predictions are not yet relied on during design. NASA's Langley Research Center sponsored a program to conduct an application of the finite element method with emphasis on predicting structural vibration. The Army/Boeing CH-47D helicopter was used as the modeling subject. The objective was to engender the needed trust in vibration predictions using these models and establish a body of modeling guides which would enable confident future prediction of airframe vibration as part of the regular design process. The problems helicopter operators face when using VHF communications within typical operating environments where coverage by the network of ground stations may be deficient are addressed. This is of particular interest to IFR helicopter operators. The specific reasons why communications effectiveness can be limited in mountainous or remote regions, considering typical low helicopter operating altitudes, are reviewed. Recommendations to operators for improving the airborne VHF installation, and therefore improving its coverage capabilities, are presented. Several installation-related factors are discussed. These include the characteristics of the hardware, i.e., the transceiver and the antenna, and the characteristics of the installation, including antenna installation and resulting coverage pattern, the cable run, the effects of signal availability and ways of maximizing the capture of the available signal. A set of procedures is presented which allows operators to evaluate numerically the benefit in terms of signal strength or sensitivity they may expect given that they make specific improvements to a given actual or planned installation. **NUMBER OF TARGETS THREATENED SIMULTANEOUSLY (NOTTS) IN CONJUNCTION WITH OVER THE HORIZON BACK-SCATTER (OTHB) RADAR COVERAGE Final Report, Jan. 1984 - Dec. 1985**
J. F. SHEEDY Aug. 1985 74 p
(AD-A159304; AD-F250300; USAFA-TR-85-9) Avail: NTIS HC A04/MF A01 CSCL 17I

Number of Targets Threatened Simultaneously (NOTTS) is a measure of the presence (in a background of unknowns) of a surprise attack on the U.S. retaliatory force. Four NOTTS indicators PEAK, KURTOSIS, RIDGE, and P1, P2, and P3 are defined and evaluated using the J5YA Raid Recognition Algorithm for a bomber or cruise missile raid against SAC and C3 target sets. Scatter charts showing background noise produced by commercial traffic, raid plus noise combined are presented and used to describe the setting of reaction thresholds. The effect of time of day, probability of radar detection, and the choice of target set and raid design on reaction threshold are discussed. Although ideal settings of indicators are practical in the cases discussed, attention is drawn to the limited data available for modeling of unknowns in OTHB coverage. GRA

**BASIC CHARACTERISTICS OF RADAR ANTENNA WITH SYNTHESIZED APERTURE TRACKING ARBITRARY MOTION OF AIRCRAFT Abstract Only**
Y. S. ITSKHOKI, N. A. SAZONOV, and Y. F. TOLSTOV *In its* USSR Report: Electronics and Electrical Engineering (JPRS-UEE-85-006) p 14 30 Apr. 1985 Transl. into ENGLISH from Radiotekhnika i Elektronika (Moscow, USSR), v. 29, no. 11, Nov. 1984 p 2164-2172
Avail: NTIS HC A05/MF A01

A problem in tracking the motion of an aircraft which carries a radar antenna with synthesized aperture are random phase fluctuations of the input signal. These fluctuations, caused by instability of the aircraft trajectory and elastic vibrations of the aircraft structure as well as by tropospheric effects and intentional interference, worsen the azimuth resolution and the accuracy of azimuth determination. This situation is analyzed here for the more general case of arbitrary motion of the aircraft and arbitrary *observation angle* rather than for rectilinear motion and lateral observation. The output signal serves as performance criterion, its waveform being determined principally by the radiation pattern of the real antenna and its modulus remaining approximately constant over the aperture synthesization time. On this basis, the trajectory of the phase center of the real antenna can be approximated with a quadratic parabola. For given wavelength and elevation angle, the best azimuth resolution attainable with signal processing by the straight convolution method (second target on observation line) is determined by the length of aperture synthesization time, the tangential component of aircraft velocity, and the form of the weight function. In the absence of phase fluctuations, the error of azimuth determination is in this case determined only by the resolving power of the radar with synthesized antenna aperture. Signal processing by the harmonic analysis method introduces some defocusing, which worsens the resolution, even in the absence of phase fluctuations. Author

**HEAT TRANSFER CHARACTERISTICS WITHIN AN ARRAY OF IMPINGING JETS. EFFECTS OF CROSSFLOW TEMPERATURE RELATIVE TO JET TEMPERATURE Final Report**
L. W. FLORSCHUETZ and C. C. SU Washington NASA Oct. 1985 175 p refs
(Contract NSG-3075)
(NASA-CR-3936; E-2696; NAS 1.26:3936; CR-R-R85020) Avail: NTIS HC A08/MF A01 CSCL 20D

Spanwise average heat fluxes, resolved in the streamwise direction to one stream-wise hole spacing were measured for two-dimensional arrays of circular air jets impinging on a heat transfer surface parallel to the jet orifice plate. The jet flow, after impingement, was constrained to exit in a single direction along the channel formed by the jet orifice plate and heat transfer surface. The crossflow originated from the jets following impingement and an initial crossflow was present that approached the array through an upstream extension of the channel. The regional average heat fluxes are considered as a function of parameters associated with corresponding individual spanwise rows within the array. A linear superposition model was employed to formulate appropriate governing parameters for the individual row domain. The effects of flow history upstream of an individual row domain are also considered. The results are formulated in terms of individual spanwise row parameters. A corresponding set of streamwise resolved heat transfer characteristics formulated in terms of flow and geometric parameters characterizing the overall arrays is described. E.A.K.

Computers are playing an increasingly important role in the field of aerodynamics such as that they now serve as a major complement to wind tunnels in aerospace research and development. Factors pacing advances in computational aerodynamics are identified, including the amount of computational power required to take the next major step in the discipline. The four main areas of computational aerodynamics research at NASA Ames Research Center which are directed toward extending the state of the art are identified and discussed. Example results obtained from approximate forms of the governing equations are presented and discussed, both in the context of levels of computer power required and the degree to which they either further the frontiers of research or apply to programs of practical importance. Finally, the Numerical Aerodynamic Simulation Program--with its 1988 target of achieving a sustained computational rate of 1 billion floating-point operations per second--is discussed in terms of its goals, status, and its projected effect on the future of computational aerodynamics. **MOBILE INTERCEPT OF STORMS**
R. T. ARNOLD *In* NASA. Marshall Space Flight Center NASA/MSFC FY-85 Atmospheric Processes Research Review p 7-8 Oct. 1985 refs
Avail: NTIS HC A07/MF A01 CSCL 04B

A NASA U2 research aircraft was used to fly over storms in the area of Oklahoma, southern Kansas, and north Texas. The primary goal was to acquire lightning data to serve as ground truth for U2 overflights. A mobile laboratory was instrumented and the storm intercept was coordinated through communication to the U2 provided by airplane guidance at NSSL and through direct communication with the U2 pilot from a portable transceiver in the mobile lab. The flights were successful in spite of an unusual sparsity of storm activity during the operational period and an early termination of the scheduled flight program. Severe storms data was gathered within the area of Oklahoma with good Doppler radar coverage. A vehicle followed a mobile lab and released instrumented balloons. A standard meteorological rawinsonde was used as was a balloon-borne electric field meter. There was success in flying, tracking, and receiving data from mobily launched balloons on several days. **RESULTS OF ICING FLIGHTS IN WINTER 1983/84: ICE ACCRETION THICKNESS IN CORRELATION WITH CLOUD PHYSICAL PARAMETERS, OBJECT AND CLOUD PARAMETERS**
H. E. HOFFMANN, R. ROTH, and J. DEMMEL May 1985 46 p refs In GERMAN; ENGLISH summary
(DFVLR-FB-85-39; ISSN-0171-1342) Avail: NTIS HC A03/MF A01; DFVLR, Cologne DM 16

Twenty-five icing flights on a DO 28 research aircraft were carried out to determine the correlation between ice accretion thickness on standard cylinders and cloud physical parameters (liquid water content, temperature, particle phase and size), object parameters (cylinder diameter) and cloud parameters (cloud altitude, location coordinates, time, stratus or cumulus). The relationship between ice accretion thickness and water content is demonstrated with the ice accretion model of the Canadian National Research Council. Effects of the cloud particle size on ice accretion thickness could not be shown. The ice accretion thickness change due to liquid water content depends on cylinder diameter. Liquid water content, ice accretion thickness, and icing degree increase with altitude. Stratus or cumulus has no effect on the ice accretion thickness. Author (ESA)

**METHOD OF CALCULATING ANGULAR DIMENSIONS OF FLIGHT VEHICLE COCKPIT CANOPY CASINGS**
A. V. LEKAREV *In its* USSR Report: Space Biology and Aerospace Medicine, Vol. 19, No. 4, Jul. - Aug. 1985 (JPRS-USB-85-006) p 120-124 4 Nov. 1985 refs Transl. into ENGLISH from Kosmich. Biol. i Aviakosmich. Med. (Moscow), v. 19, no. 4, Jul. - Aug. 1985 p 81-83
Avail: NTIS HC A08

The view from flight vehicle (FV) cockpits is an important factor in assuring flying safety and providing comfortable conditions for the pilot's visual observation of space outside the cockpit. At the present time, transparent parts of most cockpits in different types of FV are executed in the form of flat panels installed into the metal frame of the cockpit canopy. Presence of opaque components (casings) in the cockpit canopy results in obscuring part of the outside area, which worsens viewing conditions from the pilot's work place. In order to improve the view from FV cockpits with flat transparent parts, a method was developed for calculating the angular dimensions of casings (seams) on the basis of distinctions of human binocular vision. The proposed method makes it possible to meet the requirements as to strength features of the canopy frame and provide for comfortable viewing conditions outside the cockpit. The method is based on crossed diplopia in an empirical horopter from a point of the cyclopic eye of the observer. B.W.

(AIAA PAPER 85-4048)

An initial integration of artificial intelligence (AI) in the aircraft cockpit is described. A prototype expert system is to be implemented as a pilot's assistant in a simulation environment. The flight simulation environment provides a realistic vehicle for the critical evaluation of the expert system. Plans and objectives for General Dynamics' AI simulation efforts are presented. D.H.

**SIMPLE APPROXIMATIONS OF FUNCTIONS WITH ADDITIONAL CONSTRAINTS [PROSTYE PRIBLIZHENIIA FUNKTSII S DOPOLNITEL'NYMI USLOVIIAMI]**
A. V. ANTONETS Zhurnal Vychislitel'noi Matematiki i Matematicheskoi Fiziki (ISSN 0044-4669), vol. 25, Nov. 1985, p. 1589-1598. In Russian. refs

Simple formulas and algorithms for the criterial approximation of functions are proposed which are relevant to problems in practical aerodynamics. For the unified numerical solution of higher-order systems of linear equations with a rectangular matrix, a method of consecutive 'minimal' refinements is developed whereby computational process with automatic control of rounding-off error accumulation invariably yields an accurate or an approximate 'compromise' solution. Examples of correlations of the aerodynamic coefficients of bodies are presented which can lead to the development of an efficient method for calculating aerodynamic characteristics using reference bodies. This final report describes an exploratory development effort for the design and fabrication of a digital servocontroller system for load control in full-scale air-frame fatigue tests. Each digital controller replaces four analog controllers. The LSI-11/23 microcomputer in the digital controller executes a PI algorithm to implement direct digital control. It may operate in a stand-alone mode or as a slave processor to a master computer via fiber optic link. Other programmable features specifying loop parameters, building load profiles, adjusting control system gains and monitoring alarm and abort conditions. GRA

This thesis investigated the available methods for implementing human-computer interfaces using sophisticated graphics systems, with the goal of designing and implementing an advanced graphics development environment. Such a developmental laboratory is necessary to support current and futuristic crew station design for display-oriented cockpits. The result of this effort was the development system DESIGNS. The DESIGNS software system was tailored specifically for real-time, pilot-in-the-loop, research and development simulation. Critical features of such a system include fast turn-around time, and the capability to expand as enhanced tools are developed. The resulting system supports interactive development of heads-up and heads-down display symbology. It generates correct display formatting information for multiple target graphics devices. Future enhancements include rehosting to a more powerful workstation, preferably in Ada, and continued addition of graphics development tools supporting simulation needs. GRA

A study was done to identify and evaluate options for providing major improvements, extensions, and integration of essential automatic data processing equipment. This work is part of a long-term (several years duration) project in which Oak Ridge National Laboratory (ORNL) is establishing a center of excellence in support of the Department of the Navy in the Shipboard Nontactical Automated Data Processing Program. The program involves Honewell DPS-6 minicomputers, Digital Equipment Corporation PDP-11 minicomputers, Zenith personal computers, and magnetic tape recorders for surface processing of in-flight recorded data. The central issue addressed in this report is hardware and software options for interfacing the tape readers to the Honeywell equipment. Three leading candidate methods for providing the required interface were identified and analyzed. Variations of one method were also analyzed. A system-by-system comparison of the options is given in seven key areas: data transfer speed, data transmission distance capabilities, adaptability for processing classified data, flexibility and/or expandability, space required, logistics, and cost. **TONE EXCITED JETS. I - INTRODUCTION**
H. K. TANNA and K. K. AHUJA (Lockheed-Georgia Co., Marietta, GA) Journal of Sound and Vibration (ISSN 0022-460X), vol. 102, Sept. 8, 1985, p. 57-61. Research supported by Lockheed Internal Research and Development Program. refs
(Contract NAS3-21987)

The major objective of the present study is an understanding of the mechanism of broadband jet noise augmentation due to upstream excitation, in terms of the relationship between excitation characteristics, changes in large scale and/or small scale turbulence structure of the jet, and sound radiated to the far field under both static and simulated forward velocity conditions. A systematic set of acoustic measurements was accordingly made for a range of flow conditions in the acoustic research facilities of a large transport aircraft manufacturer. After analyzing acoustic results, turbulence measurements were made with a laser velocimeter for those jet conditions at which jet noise amplification was important. A theory was developed to account for static and in-flight simulation results. O.C.

**TONE EXCITED JETS. IV - ACOUSTIC MEASUREMENTS**
K. K. AHUJA and D. F. BLAKNEY (Lockheed-Georgia Co., Marietta, GA) Journal of Sound and Vibration (ISSN 0022-460X), vol. 102, Sept. 8, 1985, p. 93-117. Research supported by Lockheed Internal Research and Development Program. refs
(Contract NAS3-21987)

Attention is given to acoustic results from an experiment designed to deepen insight into the noise generated by a tone-excited jet, with emphasis on the mechanism of broadband jet noise amplification. Results are presented for both heated and unheated jets, with and without the effect of forward flight simulation over a range of excitation frequencies and levels, and for zero-order and first-order spinning modes. Broadband jet noise amplifications of up to 5 dB have been observed in this study. Relative velocity effects are the same for both excited and unexcited jets. It is concluded that small scale turbulence generates the additional broadband noise upon excitation of the jet by an upstream-injected discrete tone acoustic wave. O.C.

**NOISE OF COUNTER-ROTATION PROPELLERS WITH NONSYNCHRONOUS ROTORS**
D. B. HANSON and C. J. MCCOLGAN (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT) Journal of Aircraft (ISSN 0021-8669), vol. 22, Dec. 1985, p. 1097-1099.

Counter-rotating propeller rotors, when run at different speeds, give rise to a noise spectrum-splitting phenomenon whose rotor-alone and interaction tones can be discriminated. Tabular data are presently given for such a rotor system, indicating mode behavior with frequency near the blade passing frequency and at twice that frequency. The mode-splitting behavior is found to constitute a powerful technique for noise source diagnoses in counter-rotating propellers. O.C.

**ACOUSTIC RECOGNITION OF AIRCRAFT TYPES IN FLIGHT**
I. YAMADA, A. YOKOTA, K. YAMAMOTO, and S. SHIMIZU (Kobayasi Institute of Physical Research, Kokubunji, Japan) Acoustical Society of Japan, Journal (ISSN 0388-2861), vol. 6, July 1985, p. 203-213. refs

A method for the acoustic recognition of aircraft types and flight patterns is presented, in which a discriminatory analysis slightly different from the ordinary one is used and peak-hold spectra (one-third octave band) relative to the peak value of A weighted sound pressure levels are selected for characteristic parameters of reference patterns. The newly developed procedure proved to be able to recognize aircraft types and flight patterns accurately irrespective of the mission of an airfield. Only a small number of parameters are required in the procedure. Author

**NOISE GENERATED BY A STRETCHING VORTEX**
R. LEGENDRE (ONERA, Chatillon-sous-Bagneux, France) La Recherche Aerospatiale (English Edition) (ISSN 0379-380X), no. 2, 1985, p. 73-78.

A model of turbulence which consists of concentrated eddies has been used to illustrate a substantial source of aerodynamic noise. It is noted that the small vortex tubes between the large eddies, which have nonnegligible rotationals, probably have little effect on noise generation in virtue of their random signs and small peripheral velocities. Attention is given to the 'vortex stretching' phenomenon in three-dimensional flow, which is due to interactions with other vortices or with obstacles; calculations are presented which demonstrate this to be a powerful source of aerodynamic noise. O.C.

**01GENERAL AVIATION INTERIOR NOISE PROBLEM: SOME SUGGESTED SOLUTIONS Ph.D. Thesis**

R. NAVANEETHAN 1984 465 p

Avail: Univ. Microfilms Order No. DA8513813

The airborne noise transmission through aircraft sidewall is one of the important source, path combinations of the sound transmission into an aircraft cabin. A broad-based approach, i.e., laboratory investigation of sound transmission through panels, use of modern data analysis techniques and application to actual aircraft was used to determine methods to reduce general aviation interior noise. The experimental noise reduction characteristics of stiffened flat and curved panels with damping treatment are discussed. The experimental results of double-wall panels used in the general aviation industry are given. The effects of skin panel material, fiberglass insulation and trim panel material on the noise reduction characteristics of double-wall panels are investigated. These results are compared with the theoretical predictions from classical sound transmission theory for multilayered panels. The changes needed in the classical sound transmission theory for a better agreement are discussed. It is also shown that the same theory can successfully be used to design the interior noise control treatment of a new aircraft. Author

The objective of this project was to develop high-temperature pressure sensors using non-metallic components and optical sensing methods. The sensors are to operate over a temperature range from room temperature approx. 20C to 540C, to respond to internal pressure up to 690 kPa, to respond to external pressure up to 690 kPa, and to withstand external overpressure of 2070 kPa. Project tasks include evaluating sensing techniques and sensor systems. These efforts include materials and sensing method selection, sensor design, sensor fabrication, and sensor testing. Sensors are tested as a function of temperature, pressure, overpressure, and vibration. The project results show that high-temperature pressure sensors based on glass components and optical sensing methods are feasible. The microbend optical diaphragm deflection sensor exhibits the required sensitivity and stability for use as a pressure sensor with temperature compensation. for the microbend sensor, the 95% confidence level deviation of input pressure from the pressure calculated from the overall temperature-compensated calibration equation is 3.7% of full scale. The limitations of the sensors evaluated are primarily due to the restricted temperature range of suitable commercially available optical fibers and the problems associated with glass-to-metal pressure sealing over the entire testing temperature range. **ON SECOND PROPAGATION IN RADIAL FAN CASINGS**

M. BARTENWERFER and T. GIKADI (Technical Univ., Berlin) Feb. 1985 34 p refs In GERMAN; ENGLISH summary Report will also be announced as translation (ESA-TT-957)

(DFVLR-FB-85-32; ISSN-0171-1342) Avail: NTIS HC A03/MF A01; DFVLR, Cologne DM 11

Sound propagation in radial fan hollow casings was studied for cylindrical and spiral-shaped casings of the same volume and width. After measurement of the sound reflection through the different casings a monopole or dipole sound source of reduced expansion at the casing cut-off was introduced and the frequency responses in the intake and outflow canals determined. The influence of casing geometry and the flow in the casing on the rejection level and on the system frequency responses was determined. The applicability of the one-mode approximation for description of the frequency responses was verified. Torsional sound in the outflow canal can be reduced with a phase-variable sound source synchronous with the rotation frequency at the cut-off. Author (ESA)

**HOW IS AIRLINE DEREGULATION WORKING?**

M. E. LEVINE Northrop University Law Journal of Aerospace, Energy, and the Environment (ISSN 0196-1489), vol. 5, Winter 1984, p. 11-16.

An assessment is made of the economic, operational and political consequences of U.S. airline industry deregulation since 1978, which have in many cases proved very different from what the authors of the Deregulation Act anticipated. Fuel prices tripled between 1978 and 1980; this very severe strain was compounded by the air traffic controller's strike of 1981. A world-wide recession prevented the profitable sale or lease abroad of excess aircraft. Nevertheless, the greater flexibility that the deregulated environment has made for is judged to have permitted airlines to meet these problems through otherwise inconceivable route system restructurings. O.C.

**A86-18538**

**AIRLINE DEREGULATION - WHAT WILL WE KNOW AND WHEN WILL WE KNOW IT?**

B. REIN (Wiley, Johnson and Rein, Washington, DC) Northrop University Law Journal of Aerospace, Energy, and the Environment (ISSN 0196-1489), vol. 5, Winter 1984, p. 17-23.

The present evaluation of the emerging consequences of U.S. Airlines' deregulation since 1978 notes that the greater freedom now found in route system choice appears to have led to higher levels of aircraft utilization. Attention is given to the questions of company failures and mergers, and the entry of new companies into the deregulated market. The extent to which travel agencies' control by existing airlines may impede the entrance of new airlines into the market is considered. O.C.

**A86-18848**

**RECENT DEVELOPMENTS IN AVIATION CASE LAW**

W. D. CARTER, JR. (Fulbright and Jaworski, Houston, TX) Journal of Air Law and Commerce (ISSN 0021-8642), vol. 51, no. 1, 1985, p. 51-118. refs

A review of cases pertaining to recent aviation decisions is presented. Cases regarding federal subject matter, jurisdiction, personal jurisdiction, death in aircraft crashes in water, and federal removal are analyzed. Governmental liability and exception are studied. Cases concerning air carrier liability, including products damage and negligence, are examined. The applicability of the Warsaw Convention to notice of claims, limitation on liability, and damage recovery is investigated. General, and pilot qualification and airworthiness certificate insurance exclusions are discussed. Cases involving damage and the calculation of damage incurred in an aircraft accident are described. I.F.

**A86-18649**
**PILOT MEDICAL CERTIFICATION - PROCEDURES AND RECENT DEVELOPMENTS**
M. T. MCDERMOTT and R. J. SHERBACK (Joseph, Powell, McDermott, and Reiner, Washington, DC) Journal of Air Law and Commerce (ISSN 0021-8642), vol. 51, no. 1, 1985, p. 119-154. refs

The role of the FAA in issuing the three classes of pilot medical certification is described. The FAA can deny, revoke, or require reexamination of medical certification; the pilot can counter a revocation by requesting reconsideration, special insurance or exemption, or review by the NTSB. The NTSB's review procedure is examined. Examples of court case requesting recertification are presented. FAA changes in the regulations governing coronary artery disease, alcoholism, and request for exemption procedures are discussed; these FAA changes limit the review power of the NTSB. NTSB changes in discovery, now allowing depositions and interrogations, are examined. The effect of a new FAA Administrator and Federal Air Surgeon on FAA policy is considered. I.F.

**THE F/A-18 FIGHTER/ATTACK AIRCRAFT PROGRAM**
P. G. NICHOLSON May 1985 72 p
(AD-A159292; AD-F250300; AU-AWC-85-157) Avail: NTIS HC A04/MF A01 CSCL 05A

The history of the F/A-18 Fighter/Attack aircraft program is traced from its beginning as a result of the Naval Air Combat Fighter competition to 1984 when its future seems assured. Factors which affected the acquisition process are examined with a view to identifying those which might have significant influence on future tactical aircraft programs. Not surprisingly, the dominant factor is shown to be program cost and a number of strategies to minimize the effects of budgetary constraints are identified. The need for long-term planning and a rational comprehensive approach to controllable, programmatic factors is seen as essential in order to maintain adequate production levels in the face of less controllable economic factors. A coordinated approach to the operational requirements of the four United States tactical air forces is considered mandatory in order to promote commonality and develop multiple solutions. If this is not achieved, the F/A-18 program indicates that Congress is likely to intervene and play a more active role in areas where professional military expertise has traditionally held sway. GRA

**LIZZY - THE FIRST BRITISH LIQUID PROPELLANT ROCKET MOTOR**
J. GRIFFITHS (Science Museum, London, England) British Interplanetary Society, Journal (ISSN 0007-084X), vol. 38, Dec. 1985, p. 531-536. refs

Low-budget efforts by government-funded British researchers experimenting with liquid-fueled rocket concepts from 1941-43 are chronicled. The program was initiated to find a replacement for cordite as a rocket fuel. It was decided to follow the few published notes of Goddard and use LOX and gasoline. The immediate design problems were handling the LOX, building a combustion chamber, initiating the firing and delivering fuel to the combustion chamber. The goal was an engine that would produce 2000 lb thrust for 30 sec. Tests covered post-nozzle mixing of fuels and various nozzle geometries, chamber materials, flow rates and nozzle cooling techniques. A detailed pictorial summary of the first successful test, producing 1000 lb thrust, 7 mos after the program was initiated is provided. M.S.K.

Investigation of chemically-reacting supersonic internal flows
[NASA-CR-176363] p 188 N86-14532
Digital servocontroller system. Volume 2. Maintenance manual
[AD-A159066] p 179 N86-15322
**ALTIMETERS**
Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha times beta vane
[NAL-TR-852] p 172 N86-15312
**ANGLE OF ATTACK**
Static and dynamic pitch stability of a blunted cone with forward facing aerodynamic spike in hypersonic flow p 135 A86-16249
Simulation of three-dimensional viscous transonic flows p 148 N86-14233
Determination of corrections to flow direction sensor measurements over an angle-of-attack range from 0 degree to 85 degrees
[NASA-TM-86402] p 167 N86-14267

Hypersonic characteristics of an advanced aerospace plane at Mach 20.3
[NASA-TM-86435] p 152 N86-15245
Use of hinged strakes for lateral control at high angles of attack
[AD-A158005] p 178 N86-15321
Numerical simulation of viscous supersonic flow over a generic fighter configuration
[NASA-TM-86823] p 190 N86-15627

**ANGULAR MOMENTUM**
Stability of large damped flexible spacecraft with stored angular momentum p 182 A86-18355

**ANISOTROPIC FLUIDS**
Contribution to the potential calculation of anisotropic compression shocks in a plane case
p 150 N86-14245

**ANISOTROPIC PLATES**
Stress concentration around a small circular hole in the HiMAT composite plate
[NASA-TM-86036] p 184 N86-15350

**ANTIMISTING FUELS**
Antimisting kerosene: Development of a continuous 10 GPM in-line blender
[NASA-CR-176432] p 185 N86-15412

**APPLICATIONS PROGRAMS (COMPUTERS)**
Increasing productivity of the McAuto CAD/CAE system by user-specific applications programming
p 193 N86-15200

**APPROACH CONTROL**
Investigations of the aircraft landing process using a computerized simulation model based on the Monte Carlo method
[DFVLR-FB-85-27] p 167 N86-14269

**APPROXIMATION**
Simple approximations of functions with additional constraints p 192 A86-18918
Numerical approximation of the total drag of a body in a tube
[AD-A159548] p 188 N86-14538
Numerical solutions for three-dimensional cases: Delta wings p 155 N86-15264

**ARRAYS**
Heat transfer characteristics within an array of impinging jets. Effects of crossflow temperature relative to jet temperature
[NASA-CR-3936] p 190 N86-15625

**ARTIFICIAL INTELLIGENCE**
General dynamics simulation and artificial intelligence integration
[AIAA PAPER 85-4048] p 192 A86-17830

**ARTIFICIAL SATELLITES**
West Europe report: Science and technology
[JPRS-WST-85-024] p 189 N86-15447

**ASPECT RATIO**
Aspect ratio effects on the aerodynamics of a Wortmann airfoil at low Reynolds number p 137 A86-16313

**ASPHALT**
Furfuryl alcohol polymer concretes for use in all-weather repairs of concrete and asphalt surfaces
[DE85-014825] p 184 N86-14391

**ATMOSPHERIC EFFECTS**
The disturbance of aircraft navigation and communication systems by atmospheric static electricity
p 160 A86-18695

**ATMOSPHERIC ELECTRICITY**
The disturbance of aircraft navigation and communication systems by atmospheric static electricity
p 160 A86-18695

**ATMOSPHERIC SOUNDING**
Mobile intercept of storms p 191 N86-15771

**ATMOSPHERIC TURBULENCE**
Downburst: Microburst and macroburst
[PB85-148880] p 191 N86-14826

**ATOMIZERS**
Formation and characterization of simulated small droplet icing clouds
[NASA-TM-87180] p 188 N86-14554

**ATTITUDE (INCLINATION)**
Spatial orientation of an aircraft during the execution of lateral maneuvers p 175 A86-18987

**ATTITUDE CONTROL**
A flightpath overshoot flying qualities metric for the landing task
[NASA-TM-86795] p 176 N86-14276

**AUTOMATIC CONTROL**
Light helicopter family trade-off analysis. Volume 7: Appendix R
[AD-A158076] p 168 N86-15307
Work on putting computer and CRTs in airliner control panels p 172 N86-15947

**AUTOMATIC FLIGHT CONTROL**
Integrated Application of Active Controls (IAAC) technology to an advanced subsonic transport project: Test act system description
[NASA-CR-172221] p 176 N86-14277

**AUTOMATIC PILOTS**
An analytical modularized treatment of autopilots for guided projectile simulations
[AD-A159311] p 182 N86-14282
PIFCGT: A PIF autopilot design program for general aviation aircraft
[NASA-CR-166123] p 178 N86-15320

**AUTOMATIC TEST EQUIPMENT**
The past, the present, and the future of aircraft test and diagnostic technology p 179 A86-16854
An aircraft maintenance and repair strategy using a test and diagnostic system p 133 A86-16855
A computerized automatic control system for structural testing p 192 A86-18438

**AUTOMATION**
Simulating the total system, warts and all — automatic target acquisition for LHX helicopter p 164 A86-18422
System partitioning to provide for automatic mission and vehicle management p 175 A86-18465

**AUXILIARY POWER SOURCES**
Small turbine technology review
[AD-A158514] p 175 N86-15316

**AVIONICS**
Avionics update 1986 p 170 A86-17524
Flight evaluation of a digital electronic engine control in an F-15 airplane p 173 A86-17784
A structured approach for integration and test of avionics systems p 170 A86-18423
Helicopter cockpit avionics development or the advanced transport and next generation aircraft
p 171 A86-18461
System partitioning to provide for automatic mission and vehicle management p 175 A86-18465
Toward an avionics supersystem p 172 A86-18552
The evolution of the cockpit displays in commercial airlines p 172 A86-18694
Avionics system for future civil helicopters
[BMFT-FB-W-85-005] p 160 N86-14266
Cold regions logistic supportability testing of electronic. avionic and communications equipment
[AD-A158887] p 188 N86-14514
A fault tolerant system for an integrated avionics sensor configuration
[NASA-CR-3834] p 160 N86-15276

**AXIAL FLOW**
Analysis of the effects of transient heat transfer on axial flow compressor blade boundary layers
[AD-A158094] p 175 N86-15315

**AXISYMMETRIC BODIES**
Drag reduction of perforated axisymmetric bodies in supersonic flow p 144 A86-18047
Numerical approximation of the total drag of a body in a tube
[AD-A159548] p 188 N86-14538

**AXISYMMETRIC FLOW**
An implicit finite-difference procedure for the numerical solution of unsteady supersonic flow over a blunt body
p 148 N86-14229
Calculation of axisymmetric laminar supersonic flows over blunt bodies p 148 N86-14234

**B**

**BACKGROUND NOISE**
Number of targets threatened simultaneously (NOTTS) in conjunction with over the horizon back-scatter (OTHB) radar coverage
[AD-A159304] p 189 N86-15528

**BEARING (DIRECTION)**
Analytical estimation of the variance of error in determining geographic-meridian direction by the gyrocompass method with random oscillation of the base p 160 A86-18990

**BEARINGLESS ROTORS**
Parametric study of the aeroelastic stability of a bearingless rotor p 176 N86-15283
Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover
p 177 N86-15286

**BENDING MOMENTS**
On the teaching of the principles of wing flexure-torsion flutter p 185 A86-16248

**BIOTECHNOLOGY**
West Europe report: Science and technology
[JPRS-WST-85-024] p 189 N86-15447

**BIRD-AIRCRAFT COLLISIONS**
Finite element analysis of soft-body impact
[AD-A158438] p 158 N86-14259

**BLADE TIPS**
Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data
[NASA-TM-86816] p 188 N86-14555
Aeroelastic considerations for torsionally soft rotors
p 157 N86-15289

**BLOWDOWN WIND TUNNELS**
An airfoil flutter model suspension system to accommodate large static transonic airloads
[NASA-CR-177998] p 146 N86-14220

**BLOWOUTS**
Long taxi rolls can lead to catastrophic blow-outs
p 157 A86-17063

**BLUFF BODIES**
An experimental study of geometrical effects on the drag and flow field of two bluff bodies separated by a gap
p 141 A86-17055

**BLUNT BODIES**
Static and dynamic pitch stability of a blunted cone with forward facing aerodynamic spike in hypersonic flow
p 135 A86-16249
L.D.A. measurements in the turbulent near-wake of blunt bodies p 139 A86-16371
Heat transfer at the lateral surface of a blunt cone during the absorption of the entropy layer by a laminar or a turbulent boundary layer p 187 A86-18907
An implicit finite-difference procedure for the numerical solution of unsteady supersonic flow over a blunt body
p 148 N86-14229
Calculation of axisymmetric laminar supersonic flows over blunt bodies p 148 N86-14234
Calculation of seperated laminar supersonic flows over blunt bodies of revolution at zero angle of attack
[DFVLR-FB-85-30] p 151 N86-14256

**BO-105 HELICOPTER**
Avionics system for future civil helicopters
[BMFT-FB-W-85-005] p 160 N86-14266

**BODY KINEMATICS**
The dynamics of elastic bars under conditions of arbitrary kinematic excitation p 185 A86-16761

**BODY-WING CONFIGURATIONS**
A transonic wing-body flowfield calculation with improved grid topology p 142 A86-17134
Review of research in numerical aerodynamics at the DFVLR in Brunswick p 150 N86-14248
Procedure for solution of the full potential equation at Dornier GmbH p 150 N86-14249

**BOLTS**
Failure mechanisms of laminates transversely loaded by bolt push-through
[NASA-TM-87603] p 184 N86-14314

**BOMBER AIRCRAFT**
Number of targets threatened simultaneously (NOTTS) in conjunction with over the horizon back-scatter (OTHB) radar coverage
[AD-A159304] p 189 N86-15528

**BOUNDARY LAYER COMBUSTION**
Development of new combustor technologies for application to alternative aeroengine fuels, phase 1
[BMFT-FB-W-85-004] p 184 N86-14402

**BOUNDARY LAYER CONTROL**
Shock wave/turbulent boundary layer interaction and its control p 145 A86-18535
Aircraft Drag Prediction and Reduction
[AGARD-R-723] p 155 N86-15266
Aircraft drag reduction technology: A summary
p 155 N86-15267
Laminar flow control with suction: Theory and experiment p 155 N86-15269
Design considerations for application of laminar flow control systems to transport aircraft p 155 N86-15270
Turbulent drag reduction for external flows
p 156 N86-15271
Transonic drag rise and drag reduction by active/passive boundary layer control p 156 N86-15275

**BOUNDARY LAYER FLOW**
The effect of trip wire roughness on the performance of the Wortmann FX 63-137 airfoil at low Reynolds numbers p 139 A86-16322
Procedure for solution of the Navier-Stokes equations at Dornier GmbH p 149 N86-14238
Numerical approximation of the total drag of a body in a tube
[AD-A159548] p 188 N86-14538
Prediction of the drag of wings at subsonic speeds by viscous/inviscid interaction techniques
p 156 N86-15274

**BOUNDARY LAYER SEPARATION**
On the effects of boundary-layer transition on a cylindrical afterbody at incidence in low-speed flow
p 135 A86-16250
Airfoil design for Reynolds numbers between 50,000 and 500,000 p 138 A86-16302
Low Reynolds number airfoil design
p 136 A86-16303
Airfoil design at low Reynolds number with constrained pitching moment p 136 A86-16304
Research on laminar separation bubbles at Delft University of Technology in relation to low Reynolds number airfoil aerodynamics p 137 A86-16306
An analysis of a separation bubble transition criterion at low Reynolds numbers p 137 A86-16309

Theoretical and experimental study of low Reynolds number transitional separation bubbles p 137 A86-16310

Separation bubble behavior for a NACA 23009 airfoil p 137 A86-16312

Symmetry breaking and lift hysteresis arising from massive laminar separation - A study of multiple steady-state solutions p 138 A86-16316

Attached cavitation and the boundary layer - Experimental investigation and numerical treatment p 186 A86-17032

Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence [AIAA PAPER 85-1690] p 143 A86-17845

The vortex patterns of dynamic separation - A parametric and comparative study p 145 A86-18534

Calculation of separated laminar supersonic flows over blunt bodies of revolution at zero angle of attack [DFVLR-FB-85-30] p 151 N86-14256

**BOUNDARY LAYER STABILITY**

Effect of pressure gradients on the growth of subharmonic disturbances in boundary layers p 136 A86-16306

Boundary-layer transition: T-S waves and crossflow mechanisms p 155 N86-15268

Laminar flow control with suction: Theory and experiment p 155 N86-15269

**BOUNDARY LAYER TRANSITION**

On the effects of boundary-layer transition on a cylindrical afterbody at incidence in low-speed flow p 135 A86-16250

Effect of pressure gradients on the growth of subharmonic disturbances in boundary layers p 136 A86-16306

Theoretical and experimental study of low Reynolds number transitional separation bubbles p 137 A86-16310

Aircraft Drag Prediction and Reduction [AGARD-R-723] p 155 N86-15266

Boundary-layer transition: T-S waves and crossflow mechanisms p 155 N86-15268

Laminar flow control with suction: Theory and experiment p 155 N86-15269

**BOUNDARY LAYERS**

Relative advantages of thin-layer Navier-Stokes and interactive boundary-layer procedures [NASA-TM-86778] p 152 N86-15244

F-111 natural laminar flow glove flight test data analysis and boundary layer stability analysis [NASA-CR-166051] p 168 N86-15305

Analysis of the effects of transient heat transfer on axial flow compressor blade boundary layers [AD-A158094] p 175 N86-15315

**BOUNDARY VALUE PROBLEMS**

The state of development research in numerical aerodynamics in West Germany — conference [DGLR-84-01] p 147 N86-14225

Summary report on the working group for conference 1: Solutions of the Navier-Stokes equations p 147 N86-14226

Solutions of the Navier-Stokes equations with the finite volume method p 148 N86-14235

A Navier-Stokes procedure for simulation of two-dimensional and quasi two-dimensional grid flows p 149 N86-14236

Shock design for refined recalculations p 150 N86-14247

Formulation of the Euler boundary value problem p 154 N86-15258

Numerical methods p 154 N86-15259

Numerical solutions for three-dimensional cases: Swept wings p 154 N86-15263

Concluding remarks p 155 N86-15265

**BRAKES (FOR ARRESTING MOTION)**

Programming a multiple-orifice hydraulic decelerator [AD-A159428] p 181 N86-15328

**BRAKING**

High-speed braking of an aircraft tire on grooved surfaces p 162 A86-17787

**BRANCHING (MATHEMATICS)**

Adapter pallet system [AD-D011858] p 191 N86-15671

**BROKEN SYMMETRY**

Symmetry breaking and lift hysteresis arising from massive laminar separation - A study of multiple steady-state solutions p 138 A86-16316

## C

**CALIBRATING**

Evaluation of a load cell model for dynamic calibration of the rotor systems research aircraft p 168 N86-15304

**CAMBER**

Delta wings with shock-free cross flow p 145 A86-18528

**CAMBERED WINGS**

West Europe report: Science and technology [JPRS-WST-85-024] p 189 N86-15447

MBB studies variable-camber wing for Airbus p 169 N86-15449

**CAMERAS**

An optimisation method for reconstruction of flight path trajectories from non-synchronous time-sampled observations by two cine cameras [ARL-SYS-R-34] p 167 N86-15279

**CANARD CONFIGURATIONS**

Configuration and longitudinal wind tunnel testing]hy] of forward-swept wings p 161 N86-14449

**CANOPIES**

Numerical simulation of viscous supersonic flow over a generic fighter configuration [NASA-TM-86823] p 190 N86-15627

Method of calculating angular dimensions of flight vehicle cockpit canopy casings p 191 N86-15886

**CARBON FIBER REINFORCED PLASTICS**

Carbon fibres: Uses and prospects; Proceedings of the Third International Conference, London, England, October 8-10, 1985 p 182 A86-16201

Manufacturing advance towards high strain fibers p 182 A86-16203

Interleaf technology for carbon composite aircraft primary structure p 182 A86-16208

**CARBON FIBERS**

Carbon fibres: Uses and prospects; Proceedings of the Third International Conference, London, England, October 8-10, 1985 p 182 A86-16201

**CARET WINGS**

Flow past caret wings with flaps p 146 A86-18903

**CARGO AIRCRAFT**

Adapter pallet system [AD-D011858] p 191 N86-15671

**CASCADE FLOW**

Computation of flowfields in high solidity and high turning angle cascades using Euler equations [AIAA PAPER 85-1705] p 144 A86-17847

The effect of the curvature of the external contours of turbine blade profiles on their aerodynamic characteristics p 144 A86-18152

Unsteady transonic flows in an axial flow compressor p 145 A86-18529

Large-scale separation and hysteresis in cascades p 145 A86-18577

Reference test cases and contributors p 154 N86-15261

**CASING**

Method of calculating angular dimensions of flight vehicle cockpit canopy casings p 191 N86-15886

**CAST ALLOYS**

Interpretation and evaluation of fatigue properties of cast, HIP and heat treated titanium UH-60A M. R. Hub p 183 A86-18434

**CASUALTIES**

Results of the expert study of accidents during operation of German aircraft in the homeland and abroad as well as of foreign aircraft in the homeland p 158 N86-14261

Results of the expert study of accidents during operation of German aircraft in the homeland and abroad as well as of foreign aircraft in the homeland p 159 N86-14262

**CATHODE RAY TUBES**

The evolution of the cockpit displays in commercial airlines p 172 A86-18694

Work on putting computer and CRTs in airliner control panels p 172 N86-15947

**CAVITATION FLOW**

Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel p 184 N86-15346

**CAVITY RESONATORS**

Resonant cavities for stall recovery in gas turbine engines [AD-D011891] p 175 N86-15317

**CEPSTRAL ANALYSIS**

01General aviation interior noise problem: Some suggested solutions p 194 N86-15053

**CERAMIC COATINGS**

Thermal barrier coatings for jet engine improvement p 183 A86-16278

**CERTIFICATION**

FAA certification of rotorcraft engine induction system for ice protection p 157 A86-18406

New techniques for optimization and certification of helicopters in icing conditions p 164 A86-18416

Pilot medical certification - Procedures and recent developments p 195 A86-18849

**CH-47 HELICOPTER**

New techniques for optimization and certification of helicopters in icing conditions p 164 A86-18416

**CHANNEL FLOW**

Mathematical solution for unsteady subsonic flow past a thin profile in a channel p 140 A86-16851

Supercritical mode of the nonlinear interaction of subsonic and supersonic inviscid jets in a two-dimensional channel p 142 A86-17098

**CHEMICAL COMPOSITION**

Variability of major organic components in aircraft fuels [AD-A159057] p 185 N86-15415

**CHEMICAL REACTIONS**

Investigation of chemically-reacting supersonic internal flows [NASA-CR-176363] p 188 N86-14532

**CIRCULAR CONES**

Heat transfer at the lateral surface of a blunt cone during the absorption of the entropy layer by a laminar or a turbulent boundary layer p 187 A86-18907

**CIRCULAR CYLINDERS**

Results of icing flights in winter 1983/84: Ice accretion thickness in correlation with cloud physical parameters, object and cloud parameters [DFVLR-FB-85-39] p 191 N86-15838

**CIRCULATION CONTROL ROTORS**

Dynamic stability of a bearingless circulation control rotor blade in hover p 177 N86-15297

Dynamic response characteristics of a circulation control rotor model pneumatic system p 157 N86-15298

**CIVIL AVIATION**

Airline efficiency p 157 A86-17174

NASA flight operations review [NASA-CR-176404] p 135 N86-14215

Effectiveness of the civil aviation security program [AD-A159511] p 158 N86-14260

Avionics system for future civil helicopters [BMFT-FB-W-85-005] p 160 N86-14266

AN-22 test bed for advanced propeller technology p 174 N86-14274

West Europe report: Science and technology [JPRS-WST-85-024] p 189 N86-15447

**CLIMBING FLIGHT**

Engine-out take-off climb - An old airworthiness problem reviewed p 161 A86-17061

**CLOSURE LAW**

A model for closing the inviscid form of the average-passage equation system [NASA-TM-87199] p 147 N86-14224

Separated transonic airfoil flow calculations with a nonequilibrium turbulence model [NASA-TM-86830] p 152 N86-15247

**CLOUD PHYSICS**

Downburst: Microburst and macroburst [PB85-148880] p 191 N86-14826

Results of icing flights in winter 1983/84: Ice accretion thickness in correlation with cloud physical parameters, object and cloud parameters [DFVLR-FB-85-39] p 191 N86-15838

**CLOUDS**

Formation and characterization of simulated small droplet icing clouds [NASA-TM-87180] p 188 N86-14554

**CLUTCHES**

Drive train simulation requirements for development of helicopter overrunning clutches p 166 A86-17071

**COATINGS**

A method for measuring pressure distribution by means of indicating coatings p 140 A86-16687

**COCKPIT SIMULATORS**

General dynamics simulation and artificial intelligence integration [AIAA PAPER 85-4048] p 192 A86-17830

Manned simulation studies of aircrew workload in the F-15 dual role fighter p 158 A86-18454

Advanced technology cockpit simulator p 180 A86-18462

**COCKPITS**

Big Picture - Answer to the big problem? p 170 A86-17172

Specialists' Meeting on Advanced Cockpit Design, Grapevine, Tex, October 3, 4, 1984, Proceedings p 170 A86-18451

Wide-angle, low-altitude flight simulator vision system for cockpit research and aircrew training p 180 A86-18453

Overview of advanced display technologies p 171 A86-18455

A thin film electroluminescent display for cockpit applications p 171 A86-18456

Tomorrow's cockpit technology in today's modern helicopter p 166 A86-18457

Helicopter cockpit avionics development or the advanced transport and next generation aircraft p 171 A86-18461

The evolution of the cockpit displays in commercial airlines p 172 A86-18694

Method of calculating angular dimensions of flight vehicle cockpit canopy casings p 191 N86-15886

**COILS**

Ferromagnetic resonance probe liftoff suppression apparatus
[AD-D011913] p 190 N86-15647

**COLD WEATHER TESTS**

Cold regions logistic supportability testing of electronic, avionic and communications equipment
[AD-A158887] p 186 N86-14514

**COMBAT**

The fighter. III p 162 A86-17523

Testing helicopters for the air-to-air combat role p 164 A86-18424

**COMBUSTION CHAMBERS**

Development of new combustor technologies for application to alternative aeroengine fuels, phase 1
[BMFT-FB-W-85-004] p 184 N86-14402

Fuel effects on soot formation in turbojet engines
[AD-A159073] p 185 N86-15416

**COMMAND AND CONTROL**

Modernizing tactical C3I p 159 A86-18551

**COMMERCIAL AIRCRAFT**

Propulsion for advanced commercial transports
[AIAA PAPER 85-3061] p 173 A86-17829

Turbofan engines for commercial aircraft p 173 A86-18725

Compilation and analysis of the Federal Aviation Administration's inspection of a sample of commercial air carriers
[PB85-241196] p 159 N86-14284

**COMMUNICATION EQUIPMENT**

Modernizing tactical C3I p 159 A86-18551

Cold regions logistic supportability testing of electronic, avionic and communications equipment
[AD-A158887] p 186 N86-14514

**COMPOSITE MATERIALS**

Composite tail section offers superior performance p 133 A86-17379

Pultrusion used to fabricate tail rotor spar p 133 A86-17380

Generic aspects of delamination in fatigue of composite materials p 183 A86-18432

Failure mechanisms of laminates transversely loaded by bolt push-through
[NASA-TM-87603] p 184 N86-14314

Stress concentration around a small circular hole in the HiMAT composite plate
[NASA-TM-86038] p 184 N86-15350

**COMPOSITE STRUCTURES**

Manufacturing advance towards high strain fibers p 182 A86-16203

Parts integration - Advantages and problems --- in aircraft design p 133 A86-16207

Interleaf technology for carbon composite aircraft primary structure p 182 A86-16208

Developmental testing for composite frames --- of helicopters p 163 A86-18403

Development testing of the H-60 composite main rotor blade p 163 A86-18404

U.S. Army/Sikorsky ACAP airframe test techniques/methodology p 165 A86-18427

Flight service evaluation of advanced composite ailerons on the L-1011 transport aircraft
[NASA-CR-177960] p 184 N86-14317

Test results from a dynamic model dynaflex rotor p 167 N86-15285

**COMPRESSIBLE BOUNDARY LAYER**

A compressible laminar boundary layer on a plane triangular plate with an attached shock wave p 146 A86-18902

**COMPRESSIBLE FLOW**

A fourth-order scheme for the unsteady compressible Navier-Stokes equations
[NASA-CR-177994] p 147 N86-14221

Solutions of the Navier-Stokes equations for vortical flow p 148 N86-14231

Numerical solutions for three-dimensional cases: Swept wings p 154 N86-15263

Analysis of the effects of transient heat transfer on axial flow compressor blade boundary layers
[AD-A158094] p 175 N86-15315

**COMPRESSOR BLADES**

Analysis of the effects of transient heat transfer on axial flow compressor blade boundary layers
[AD-A158094] p 175 N86-15315

**COMPUTATION**

A fourth-order scheme for the unsteady compressible Navier-Stokes equations
[NASA-CR-177994] p 147 N86-14221

**COMPUTATIONAL FLUID DYNAMICS**

Computational and theoretical studies of unsteady viscous aerodynamics p 137 A86-16307

Research on laminar separation bubbles at Delft University of Technology in relation to low Reynolds number airfoil aerodynamics p 137 A86-16308

Computational study of flow over Miley and Wortmann airfoils p 138 A86-16317

Experiments with several elements for viscous incompressible flows p 186 A86-16833

A theoretical basis for extending surface-paneling methods to transonic flow p 142 A86-17131

A transonic wing-body flowfield calculation with improved grid topology p 142 A86-17134

Calculation of three-dimensional shock/turbulent boundary-layer interaction generated by sharp fin p 142 A86-17135

Vortex-fitted potential and vortex-captured Euler solution for leading-edge vortex flow p 142 A86-17149

Three-dimensional solutions to the Euler equations with one million grid points p 142 A86-17150

Solution of the Euler equations - Explicit schemes acceleration by a multigrid method
[ONERA, TP NO. 1985-129] p 142 A86-17627

A comparative study of the parabolized Navier-Stokes code using various grid-generation techniques p 143 A86-17654

On a weak solution for a transonic flow problem p 143 A86-17738

Helicopter linear noise p 193 A86-17776

Application of NLR's calculation methods to transonic flow about oscillating wings p 143 A86-17778

Nonplanar, subsonic, three-dimensional oscillatory piecewise continuous kernel function method p 162 A86-17779

Interactive graphics for geometry generation - A program with a contemporary design p 192 A86-17781

Computation of flowfields in high solidity and high turning angle cascades using Euler equations
[AIAA PAPER 85-1705] p 144 A86-17847

Numerical computation of unsteady transonic flow about wings with flaps
[AIAA PAPER 85-1712] p 144 A86-17849

On the numerical solution of nonlinear problems in fluid dynamics by least squares and finite element methods. II Applications to transonic flow simulations p 144 A86-17886

Computation of unsteady transonic flows with an implicit numerical method for solving the Euler equations p 145 A86-18686

A compressible laminar boundary layer on a plane triangular plate with an attached shock wave p 146 A86-18902

Simple approximations of functions with additional constraints p 192 A86-18918

Summary report on the working group for conference 1: Solutions of the Navier-Stokes equations p 147 N86-14226

Integrated wing engine system (IFAS), phase 2
[BMFT-FB-W-85-008] p 151 N86-14257

Test cases for inviscid flow field methods
[AGARD-AR-211] p 153 N86-15256

Numerical methods p 154 N86-15259

Exact solutions to transonic and supersonic flows p 154 N86-15260

Numerical solutions of two-dimensional reference test cases p 154 N86-15262

Computational fluid dynamics at NASA Ames and the numerical aerodynamic simulation program
[NASA-TM-86709] p 190 N86-15626

**COMPUTATIONAL GRIDS**

A transonic wing-body flowfield calculation with improved grid topology p 142 A86-17134

Three-dimensional solutions to the Euler equations with one million grid points p 142 A86-17150

Solution of the Euler equations - Explicit schemes acceleration by a multigrid method
[ONERA, TP NO. 1985-129] p 142 A86-17627

A comparative study of the parabolized Navier-Stokes code using various grid-generation techniques p 143 A86-17654

Grid generation for single airfoil using conformal mapping
[NAL-TR-8511] p 148 N86-14217

Summary report on the working group on conference 2: Solutions of the Euler equations p 148 N86-14227

A Navier-Stokes procedure for simulation of two-dimensional and quasi two-dimensional grid flows p 149 N86-14236

Application of a dynamic grid adaptation in the ASWR procedure p 149 N86-14243

Development of multigrid algorithms for problems from fluid dynamics p 187 N86-14244

Numerical methods p 154 N86-15259

Numerical solutions of two-dimensional reference test cases p 154 N86-15262

Concluding remarks p 155 N86-15265

**COMPUTER AIDED DESIGN**

Interactive graphics for geometry generation - A program with a contemporary design p 192 A86-17781

Behaviour of a rectangular wing in a supersonic flow - Dynamic pressure and normal force analysis in the range 1.3-4.0 Mach p 146 A86-19005

Increasing productivity of the McAuto CAD/CAE system by user-specific applications programming p 193 N86-15200

Optimal design application on the advanced aeroelastic rotor blade p 167 N86-15290

Development and application of a time-history analysis for rotorcraft dynamics based on a component approach p 168 N86-15291

Restructuring the rotor analysis program C-60 p 168 N86-15292

PIFCGT: A PIF autopilot design program for general aviation aircraft
[NASA-CR-166123] p 178 N86-15320

**COMPUTER AIDED TOMOGRAPHY**

Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data
[NASA-TM-86816] p 166 N86-14555

**COMPUTER GRAPHICS**

Interactive graphics for geometry generation - A program with a contemporary design p 192 A86-17781

Increasing productivity of the McAuto CAD/CAE system by user-specific applications programming p 193 N86-15200

A rapid method for estimating equivalent parabolic polars from wind-tunnel tests
[AD-A158663] p 153 N86-15251

**COMPUTER PROGRAMS**

FLEXWAL: A computer program for predicting the wall modifications for two-dimensional, solid, adaptive-wall tunnels
[NASA-TM-84648] p 150 N86-14250

Computer program for performance prediction of tandem-rotor helicopters
[AD-A159193] p 167 N86-14268

01General aviation interior noise problem: Some suggested solutions p 194 N86-15063

Ground resonance analysis using a substructure modeling approach p 176 N86-15282

Parametric study of the aeroelastic stability of a bearingless rotor p 176 N86-15283

Development of an unsteady aerodynamics model to improve correlation of computed blade stresses with test data p 156 N86-15288

Restructuring the rotor analysis program C-60 p 168 N86-15292

Planning, creating and documenting a NASTRAN finite element model of a modern helicopter p 169 N86-15300

PIFCGT: A PIF autopilot design program for general aviation aircraft
[NASA-CR-166123] p 178 N86-15320

Programming a multiple-orifice hydraulic decelerator
[AD-A159429] p 181 N86-15326

**COMPUTERIZED SIMULATION**

Integrated wing engine system (IFAS), phase 2
[BMFT-FB-W-85-008] p 151 N86-14257

The interactive generation of alphanumerics and symbology with designs on the future
[AD-A159218] p 192 N86-14982

Use of hinged strakes for lateral control at high angles of attack
[AD-A158006] p 178 N86-15321

Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements
[AD-A158004] p 181 N86-15324

Computational fluid dynamics at NASA Ames and the numerical aerodynamic simulation program
[NASA-TM-86709] p 190 N86-15626

**CONCRETES**

Furfuryl alcohol polymer concretes for use in all-weather repairs of concrete and asphalt surfaces
[DE85-014825] p 184 N86-14301

**CONFERENCES**

Carbon fibres: Uses and prospects; Proceedings of the Third International Conference, London, England, October 8-10, 1985 p 182 A86-16201

Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings p 136 A86-16301

National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings p 163 A86-18401

Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings p 134 A86-18430

Specialists' Meeting on Advanced Cockpit Design, Grapevine, Tex, October 3, 4, 1984, Proceedings p 170 A86-18451

The state of development research in numerical aerodynamics in West Germany --- conference
[DGLR-84-01] p 147 N86-14225

**CONFORMAL MAPPING**
Grid generation for single airfoil using conformal mapping
[NAL-TR-8511] p 146 N86-14217

**CONSISTENCY**
A consistent spatial differencing scheme for the transonic full-potential equation in three dimensions
[NASA-TM-86716] p 152 N86-15246

**CONTAINERS**
Influence of the dropping conditions on container motion near the carrier and on the impact parameters
p 158 A86-19069

**CONTAMINANTS**
Aircraft accident report: Vieques Air Link, Inc., Britten-Norman BN-21-6 Islander, N589SA, Vieques, Puerto Rico, August 2, 1984
[PB85-901408] p 159 N86-15276

**CONTRAROTATING PROPELLERS**
Noise of counter-rotation propellers with nonsynchronous rotors p 193 A86-17788

**CONTROL BOARDS**
Work on putting computer and CRTs in airliner control panels p 172 N86-15947

**CONTROL EQUIPMENT**
The past, the present, and the future of aircraft test and diagnostic technology p 179 A86-16854

**CONTROL STABILITY**
Prediction of wing aeroelastic effects on aircraft lift and pitching moment characteristics
[NASA-TM-87631] p 178 N86-15319

**CONTROL SYSTEMS DESIGN**
Development of a flight test maneuver autopilot for an F-15 aircraft
[NASA-TM-86799] p 176 N86-14275

**CONTROL THEORY**
Development of a flight test maneuver autopilot for an F-15 aircraft
[NASA-TM-86799] p 176 N86-14275

**CONTROL UNITS (COMPUTERS)**
Digital servocontroller system. Volume 2. Maintenance manual
[AD-A159086] p 179 N86-15322

**CONTROL VALVES**
Dynamic response characteristics of a circulation control rotor model pneumatic system p 157 N86-15298

**COOLING**
Preliminary design of a supersonic cruise aircraft high-pressure turbine
[NASA-CR-174878] p 174 N86-14272

**COOLING SYSTEMS**
Heat transfer in cooled parts of aircraft gas-turbine engines --- Russian book p 174 A86-18745

**CORRECTION**
Determination of corrections to flow direction sensor measurements over an angle-of-attack range from 0 degree to 85 degrees
[NASA-TM-86402] p 167 N86-14267

**CORRELATION**
A review of dynamic inflow and its effect on experimental correlations p 157 N86-15293

**CORROSION PREVENTION**
Design against corrosion --- applicable to aircraft structures p 161 A86-17382

**CORROSION RESISTANCE**
Coating requirements in gas turbine engines
p 173 A86-17490

**COST ANALYSIS**
Propulsion for advanced commercial transports
[AIAA PAPER 85-3061] p 173 A86-17829

**COST EFFECTIVENESS**
Airline efficiency p 157 A86-17174
Pultrusion used to fabricate tail rotor spar
p 133 A86-17380
Magnetic suspension and balance system advanced study
[NASA-CR-3937] p 180 N86-14278

**COST REDUCTION**
Fuel saving by optimal integration of on-board avionics and air traffic control
[NLR-MP-84035-U] p 159 N86-14283

**COSTS**
Light helicopter family trade-off analysis. Volume 10: Appendices V, W, X, and Z
[AD-A158079] p 169 N86-15309

**COUNTER ROTATION**
Noise of counter-rotation propellers with nonsynchronous rotors p 193 A86-17788

**COUPLINGS**
Parametric study of the aeroelastic stability of a bearingless rotor p 176 N86-15283

**CRACK GEOMETRY**
Experimental characterization of cracks at straight attachment lugs p 188 A86-16821

**CRACK PROPAGATION**
Modelling for fatigue crack growth prediction in aircraft
p 161 A86-17011
Impact of loads recording methodology on crack-growth-based individual aircraft tracking
p 162 A86-17790
Damage tolerance analysis of components of rotor wing aircraft p 165 A86-18446
Damage tolerance analysis of the H-53 helicopter
p 166 A86-18449
Three-dimensional elastic-plastic finite-element analysis of fatigue crack propagation
[NASA-CR-176415] p 189 N86-14687

**CRACKS**
Three-dimensional elastic-plastic finite-element analysis of fatigue crack propagation
[NASA-CR-176415] p 189 N86-14687

**CRASHES**
Aircraft accident report: Vieques Air Link, Inc., Britten-Norman BN-21-6 Islander, N589SA, Vieques, Puerto Rico, August 2, 1984
[PB85-901408] p 159 N86-15276

**CRASHWORTHINESS**
Light helicopter family trade-off analysis. Volume 10: Appendices V, W, X, and Z
[AD-A158079] p 169 N86-15309

**CREW STATIONS**
Specialists' Meeting on Advanced Cockpit Design, Grapevine, Tex, October 3, 4, 1984, Proceedings
p 170 A86-18451
The interactive generation of alphanumerics and symbology with designs on the future
[AD-A158218] p 192 N86-14982

**CROSS COUPLING**
An analysis of cross-coupling of a multicomponent jet engine test stand using finite element modeling techniques
[NASA-CR-176424] p 181 N86-15323

**CROSS FLOW**
Mean-flow measurements in a supersonic three-dimensional turbulent boundary layer
p 141 A86-17059
Delta wings with shock-free cross flow
p 145 A86-18528
Boundary-layer transition: T-S waves and crossflow mechanisms p 155 N86-15268
F-111 natural laminar flow glove flight test data analysis and boundary layer stability analysis
[NASA-CR-166051] p 168 N86-15305
Heat transfer characteristics within an array of impinging jets. Effects of crossflow temperature relative to jet temperature
[NASA-CR-3936] p 190 N86-15625

**CROSS SECTIONS**
Programming a multiple-orifice hydraulic decelerator
[AD-A159428] p 181 N86-15328

**CURING**
Dynamic thermal analysis characterizations of electron-beam cured adhesives p 182 A86-16234

**CURVE FITTING**
A rapid method for estimating equivalent parabolic polars from wind-tunnel tests
[AD-A159559] p 153 N86-15251

**CURVED PANELS**
01General aviation interior noise problem: Some suggested solutions p 194 N86-15053

**CYCLIC LOADS**
Torsional low cycle fatigue of spline-ended drive components p 187 A86-18431
Another look at generalized S-N curve shapes
p 187 A86-18436

**CYLINDRICAL BODIES**
On the effects of boundary-layer transition on a cylindrical afterbody at incidence in low-speed flow
p 135 A86-16250
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17636
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17845
The experimental determination of the subsonic aerodynamic characteristics of an Ogive-Cylinder body including a comparison with theoretical estimates, volume 1
[CAR-8509] p 151 N86-15242
Programming a multiple-orifice hydraulic decelerator
[AD-A159428] p 181 N86-15328

## D

**DAMAGE**
Development and application of a time-history analysis for rotorcraft dynamics based on a component approach
p 168 N86-15291

**DAMAGE ASSESSMENT**
A methodology for analyzing laser-induced structural damage p 186 A86-17791

**DAMPING**
A review of dynamic inflow and its effect on experimental correlations p 157 N86-15293
The influence of dynamic inflow and torsional flexibility on rotor damping in forward flight from symbolically generated equations p 177 N86-15295

**DAMPING TESTS**
Calculation of separated laminar supersonic flows over blunt bodies of revolution at zero angle of attack
[DFVLR-FB-85-30] p 151 N86-14256

**DATA ACQUISITION**
Navy aircraft support data systems study: ECAMS/NALCOMIS integration feasibility and procedure
[DE85-016977] p 192 N86-15003
Performance and loads data from a hover test of a full-scale XV-15 rotor
[NASA-TM-86833] p 152 N86-15243

**DATA BASES**
Use of a stored topographic data base in the modern military helicopter p 171 A86-18459

**DATA PROCESSING EQUIPMENT**
Navy aircraft support data systems study: ECAMS/NALCOMIS integration feasibility and procedure
[DE85-016977] p 192 N86-15003

**DATA RECORDING**
Impact of loads recording methodology on crack-growth-based individual aircraft tracking
p 162 A86-17790

**DATA REDUCTION**
A rapid method for estimating equivalent parabolic polars from wind-tunnel tests
[AD-A159559] p 153 N86-15251

**DATA STORAGE**
Flight Data Analysis and Storage System (FASS)
p 170 A86-18407

**DECELERATION**
Programming a multiple-orifice hydraulic decelerator
[AD-A159428] p 181 N86-15328

**DECISION MAKING**
Light helicopter family trade-off analysis. Volume 4: Appendix N
[AD-A158075] p 168 N86-15306

**DEFECTS**
Ferromagnetic resonance probe liftoff suppression apparatus
[AD-D011913] p 190 N86-15647

**DEFORMATION**
Flutter generator control and force computer
[AEL-0242-TM] p 178 N86-15318

**DEGREES OF FREEDOM**
Coupled rotor-body vibrations with inplane degrees of freedom p 177 N86-15301

**DEICERS**
Flight tests of the helicopter pneumatic deicing system
p 163 A86-18408
New techniques for optimization and certification of helicopters in icing conditions p 164 A86-18416

**DELAMINATING**
Generic aspects of delamination in fatigue of composite materials p 183 A86-18432

**DELTA WINGS**
Vortex-fitted potential and vortex-captured Euler solution for leading-edge vortex flow p 142 A86-17149
Delta wings with shock-free cross flow
p 145 A86-18528
A compressible laminar boundary layer on a plane triangular plate with an attached shock wave
p 146 A86-18902
Flow past caret wings with flaps p 146 A86-18903
Comparison of the Euler and potential solutions for supersonic flows over delta wings p 149 N86-14239
Numerical solutions for three-dimensional cases: Delta wings p 155 N86-15264

**DESIGN ANALYSIS**
Investigations of transonic Ludwieg tubes. III - Effects of plenum exhaust system on starting process of tunnel test section p 140 A86-16838
Composite tail section offers superior performance
p 133 A86-17379
Pultrusion used to fabricate tail rotor spar
p 133 A86-17380
Velocity and temperature decay characteristics of inverted-profile jets
[NASA-TM-87159] p 147 N86-14223
Preliminary design of a supersonic cruise aircraft high-pressure turbine
[NASA-CR-174878] p 174 N86-14272
Analysis of potential helicopter vibration reduction concepts p 178 N86-15302

**DESTRUCTIVE TESTS**
Helicopter wire strike protection system qualification testing p 163 A86-18411

**DETECTION**
Number of targets threatened simultaneously (NOTTS) in conjunction with over the horizon back-scatter (OTHB) radar coverage
[AD-A159304] p 189 N86-15528

**DIAPHRAGMS (MECHANICS)**
Development of optical diaphragm deflection sensors
[NASA-CR-175008] p 194 N86-15113

**DIFFERENCE EQUATIONS**
A consistent spatial differencing scheme for the transonic full-potential equation in three dimensions
[NASA-TM-86716] p 152 N86-15246

**DIFFERENTIAL EQUATIONS**
The influence of dynamic inflow and torsional flexibility on rotor damping in forward flight from symbolically generated equations p 177 N86-15295

**DIFFERENTIAL INTERFEROMETRY**
Vortices and pressure waves at trailing edges
[ISL-CO-224/84] p 153 N86-15252

**DIFFUSION COEFFICIENT**
False diffusion in three-dimensional flow calculations p 143 A86-17653

**DIGITAL COMPUTERS**
Work on putting computer and CRTs in airliner control panels p 172 N86-15947

**DIGITAL SYSTEMS**
Evaluation of tape recordings from an airborne digital recorder p 170 A86-16858
Flight evaluation of a digital electronic engine control in an F-15 airplane p 173 A86-17784
Methodologies for the direct digital control of highly flexible vehicles
[AD-A158448] p 188 N86-14615
Digital servocontroller system. Volume 1: Operations manual
[AD-A158392] p 192 N86-14960
PIFCGT: A PIF autopilot design program for general aviation aircraft
[NASA-CR-166123] p 178 N86-15320
Digital servocontroller system. Volume 2. Maintenance manual
[AD-A159086] p 179 N86-15322

**DIGITAL TECHNIQUES**
Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data
[NASA-TM-86816] p 188 N86-14555

**DIMENSIONS**
Method of calculating angular dimensions of flight vehicle cockpit canopy casings p 191 N86-15886

**DISCONTINUITY**
Studies on the interference of wings and propeller slipstreams p 151 N86-15241

**DISCRETE FUNCTIONS**
Application of a dynamic grid adaptation in the ASWR procedure p 149 N86-14243

**DISPLACEMENT**
Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha x beta vane
[NAL-TR-852] p 172 N86-14270

**DISPLAY DEVICES**
Big Picture - Answer to the big problem? p 170 A86-17[illegible]72
Wide-angle, low-altitude flight simulator vision system for cockpit research and aircrew training p 180 A86-18453
Overview of advanced display technologies p 171 A86-18455
A thin film electroluminescent display for cockpit applications p 171 A86-18456
Tomorrow's cockpit technology in today's modern helicopter p 166 A86-18457
Advanced light emitting diode (LED) displays-paced by technology or systems application? p 171 A86-18458
Display formats and information transfer requirements as they relate to mission, aircrew and aircraft type p 171 A86-18464
The evolution of the cockpit displays in commercial airlines p 172 A86-18694
The interactive generation of alphanumerics and symbology with designs on the future
[AD-A159218] p 192 N86-14982
Work on putting computer and CRTs in airliner control panels p 172 N86-15947

**DOPPLER RADAR**
Mobile intercept of storms p 191 N86-15771

**DORNIER AIRCRAFT**
Claude Dornier - Pioneer of aviation; Academic Seminar, Technische Universitaet Muenchen, Munich, West Germany, October 24, 1984, Papers p 195 A86-16325

**DOWNWASH**
Light helicopter family trade-off analysis. Volume 10: Appendices V, W, X, and Z
[AD-A158079] p 169 N86-15309

**DRAG**
Numerical approximation of the total drag of a body in a tube
[AD-A159548] p 186 N86-14538

**DRAG MEASUREMENT**
Prediction of the drag of wings at subsonic speeds by viscous/inviscid interaction techniques p 156 N86-15274

**DRAG REDUCTION**
An experimental study of geometrical effects on the drag and flow field of two bluff bodies separated by a gap p 141 A86-17055
Drag reduction of perforated axisymmetric bodies in supersonic flow p 144 A86-18047
Aircraft Drag Prediction and Reduction
[AGARD-R-723] p 155 N86-15266
Aircraft drag reduction technology: A summary p 155 N86-15267
Laminar flow control with suction: Theory and experiment p 155 N86-15269
Design considerations for application of laminar flow control systems to transport aircraft p 155 N86-15270
Turbulent drag reduction for external flows p 156 N86-15271
Parasitic and interference drag prediction and reduction p 156 N86-15272
Recent developments in three-dimensional wake analysis p 156 N86-15273
Transonic drag rise and drag reduction by active/passive boundary layer control p 156 N86-15275

**DROPS (LIQUIDS)**
Formation and characterization of simulated small droplet icing clouds
[NASA-TM-87180] p 188 N86-1[illegible]

**DUCTED FLOW**
Multiple ducted streams with a periodic or a steady supersonic driver flow p 142 A86-17129

**DYNAMIC CHARACTERISTICS**
Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha times beta vane
[NAL-TR-852] p 172 N86-15312
Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel p 184 N86-15346
Dynamic gas temperature measurement system. Volume 2: Operation and program manual
[NASA-CR-168267] p 190 N86-15651

**DYNAMIC LOADS**
Injury pattern analysis of helicopter wire strike accidents (+Gz load) p 158 A86-18843

**DYNAMIC MODELS**
Test results from a dynamic model dynaflex rotor p 167 N86-15285
Development of an unsteady aerodynamics model to improve correlation of computed blade stresses with test data p 156 N86-15288
Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha times beta vane
[NAL-TR-852] p 172 N86-15312

**DYNAMIC PRESSURE**
Behaviour of a rectangular wing in a supersonic flow - Dynamic pressure and normal force analysis in the range 1.3-4.0 Mach p 146 A86-19005

**DYNAMIC RESPONSE**
Finite element analysis of soft-body impact
[AD-A158436] p 158 N86-14259
Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha x beta vane
[NAL-TR-852] p 172 N86-14270
A review of dynamic inflow and its effect on experimental correlations p 157 N86-15293
Dynamic response characteristics of a circulation control rotor model pneumatic system p 157 N86-15298
Dynamic response of film thickness in spiral-groove face seals
[NASA-TP-2544] p 174 N86-15313

**DYNAMIC STABILITY**
A review of dynamic inflow and its effect on experimental correlations p 157 N86-15293

**DYNAMIC STRUCTURAL ANALYSIS**
A general purpose, multi-stage, component modal synthesis method p 186 A86-18124
Aeroelasticity and dynamics of the helicopter structure --- Russian book p 166 A86-18733
Finite element analysis of soft-body impact
[AD-A158436] p 158 N86-14259
An analysis of cross-coupling of a multicomponent jet engine test stand using finite element modeling techniques
[NASA-CR-176424] p 181 N86-15323

**DYNAMIC TESTS**
Dynamic thermal analysis characterizations of electron-beam cured adhesives p 182 A86-16234

E

**EFFICIENCY**
Airline efficiency p 157 A86-17174
Propulsion for advanced commercial transports
[AIAA PAPER 85-3061] p 173 A86-17829

**EIGENVALUES**
A new Euler algorithm based on characteristic flux extrapolation p 149 N86-14241

**EJECTION SEATS**
Three-axis electrofluidic angular rate sensor for ejection seat steering thrust vector control
[AD-A159413] p 159 N86-15277

**EJECTORS**
Multiple ducted streams with a periodic or a steady supersonic driver flow p 142 A86-17129
The influence of forward flight on thrust augmenting ejectors
[AIAA PAPER 85-1589] p 173 A86-17843

**ELASTIC BARS**
The dynamics of elastic bars under conditions of arbitrary kinematic excitation p 185 A86-16761

**ELASTIC WAVES**
Vortices and pressure waves at trailing edges
[ISL-CO-224/84] p 153 N86-15252

**ELASTODYNAMICS**
The dynamics of elastic bars under conditions of arbitrary kinematic excitation p 185 A86-16761

**ELECTRIC FIELDS**
Mobile intercept of storms p 191 N86-15771

**ELECTRICAL RESISTIVITY**
The temperature dependence of the electrical conductivity of jet fuels with antistatic additives p 183 A86-16750

**ELECTROLUMINESCENCE**
A thin film electroluminescent display for cockpit applications p 171 A86-18456
Hughes helicopters AH-64A electroluminescent lighting p 171 A86-18463

**ELECTRON BEAMS**
Dynamic thermal analysis characterizations of electron-beam cured adhesives p 182 A86-16234

**ELECTRONIC CONTROL**
Flight evaluation of a digital electronic engine control in an F-15 airplane p 173 A86-17784

**ELECTRONIC EQUIPMENT TESTS**
Cold regions logistic supportability testing of electronic, avionic and communications equipment
[AD-A158887] p 186 N86-14514

**ELECTRONIC TRANSDUCERS**
Determination of corrections to flow direction sensor measurements over an angle-of-attack range from 0 degree to 85 degrees
[NASA-TM-86402] p 167 N86-14267

**ELECTRONIC WARFARE**
Toward an avionics supersystem p 172 A86-18552

**ELECTROSTATICS**
The temperature dependence of the electrical conductivity of jet fuels with antistatic additives p 183 A86-16750

**ELLIPSOIDS**
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17636
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17845

**ENERGY CONSERVATION**
Fuel saving by optimal integration of on-board avionics and air traffic control
[NLR-MP-84035-U] p 159 N86-14263

**ENGINE CONTROL**
Flight evaluation of a digital electronic engine control in an F-15 airplane p 173 A86-17784

**ENGINE DESIGN**
The V2500 engine p 173 A86-17750
Propulsion system integration configurations for future prop-fan powered aircraft p 173 A86-17777
Propulsion for advanced commercial transports
[AIAA PAPER 85-3061] p 173 A86-17829
Turbofan engines for commercial aircraft p 173 A86-18725

**ENGINE FAILURE**
Aircraft accident report: Vieques Air Link, Inc., Britten-Norman BN-21-6 Islander, N589SA, Vieques, Puerto Rico, August 2, 1984
[PB85-901409] p 159 N86-15276
Resonant cavities for stall recovery in gas turbine engines
[AD-D011891] p 175 N86-15317

**ENGINE INLETS**
FAA certification of rotorcraft engine induction system for ice protection p 157 A86-18406

**ENGINE PARTS**
Flame rig testing of thermal barrier coatings and correlation with engine results p 173 A86-17491

Heat transfer in cooled parts of aircraft gas-turbine engines --- Russian book p 174 A86-18745
AN-22 test bed for advanced propeller technology p 174 N86-14274

ENGINES
Small turbine technology review [AD-A158514] p 175 N86-15316

ENTROPY
Heat transfer at the lateral surface of a blunt cone during the absorption of the entropy layer by a laminar or a turbulent boundary layer p 187 A86-18907

ENVIRONMENT SIMULATION
The interactive generation of alphanumerics and symbology with designs on the future [AD-A159216] p 192 N86-14962

ENVIRONMENTAL SURVEYS
Variability of major organic components in aircraft fuels [AD-A159057] p 185 N86-15415

ENVIRONMENTAL TESTS
An environmental aerodynamic test system for low-Reynolds-number applications p 138 A86-16315

ENVIRONMENTS
Light helicopter family trade-off analysis. Volume 10: Appendices V, W, X, and Z [AD-A158079] p 169 N86-15309

EPOXY MATRIX COMPOSITES
Interleaf technology for carbon composite aircraft primary structure p 182 A86-16208
The AV-8B fatigue test program p 165 A86-18443

EPOXY RESINS
Dynamic thermal analysis characterizations of electron-beam cured adhesives p 182 A86-16234

EQUATIONS OF MOTION
The dynamics of elastic bars under conditions of arbitrary kinematic excitation p 185 A86-16761
Response of a rotorcraft model with damping non-linearities p 162 A86-17698
Influence of the dropping conditions on container motion near the carrier and on the impact parameters p 158 A86-19069
A fault tolerant system for an integrated avionics sensor configuration [NASA-CR-3834] p 160 N86-15278
The influence of dynamic inflow and torsional flexibility on rotor damping in forward flight from symbolically generated equations p 177 N86-15295
Flap-lag-torsion stability in forward flight p 177 N86-15296

ERRORS
Basic characteristics of radar antenna with synthesized aperture tracking arbitrary motion of aircraft p 189 N86-15575

EULER EQUATIONS OF MOTION
Three-dimensional solutions to the Euler equations with one million grid points p 142 A86-17150
Solution of the Euler equations - Explicit schemes acceleration by a multigrid method [ONERA, TP NO. 1985-129] p 142 A86-17627
Computation of flowfields in high solidity and high turning angle cascades using Euler equations [AIAA PAPER 85-1705] p 144 A86-17847
Some recent developments in numerical methods for transonic flows p 144 A86-17889
Computation of unsteady transonic flows with an implicit numerical method for solving the Euler equations p 145 A86-18686
Objectives and scope of the Working Group 07 p 153 N86-15257
Formulation of the Euler boundary value problem p 154 N86-15258
Numerical methods p 154 N86-15259
Exact solutions to transonic and supersonic flows p 154 N86-15260
Numerical solutions for three-dimensional cases: Swept wings p 154 N86-15263
Concluding remarks p 155 N86-15265

EULER-CAUCHY EQUATIONS
The state of development research in numerical aerodynamics in West Germany --- conference [DGLR-84-01] p 147 N86-14225
Summary report on the working group on conference 2: Solutions of the Euler equations p 148 N86-14227
Calculation of axisymmetric laminar supersonic flows over blunt bodies p 148 N86-14234
Comparison of the Euler and potential solutions for supersonic flows over delta wings p 149 N86-14239
Trailing edge flow with transonic profiles p 149 N86-14240
A new Euler algorithm based on characteristic flux extrapolation p 149 N86-14241
Procedure for solution of the Euler equations at Dornier GmbH p 149 N86-14242
Application of a dynamic grid adaptation in the ASWR procedure p 149 N86-14243
Contribution to the potential calculation of anisotropic compression shocks in a plane case p 150 N86-14245
Review of research in numerical aerodynamics at the DFVLR in Brunswick p 150 N86-14248

EUROPEAN AIRBUS
West Europe report: Science and technology [JPRS-WST-85-024] p 189 N86-15447
MBB studies variable-camber wing for Airbus p 169 N86-15449

EXHAUST SYSTEMS
Resonant cavities for stall recovery in gas turbine engines [AD-D011891] p 175 N86-15317

EXISTENCE THEOREMS
On a weak solution for a transonic flow problem p 143 A86-17738

EXPERT SYSTEMS
General dynamics simulation and artificial intelligence integration [AIAA PAPER 85-4048] p 192 A86-17830

EXTERNAL STORES
Flutter generator control and force computer [AEL-0242-TM] p 178 N86-15318

F

F-111 AIRCRAFT
F-111 natural laminar flow glove flight test data analysis and boundary layer stability analysis [NASA-CR-166051] p 166 N86-15305

F-15 AIRCRAFT
Flight evaluation of a digital electronic engine control in an F-15 airplane p 173 A86-17784
Manned simulation studies of aircrew workload in the F-15 dual role fighter p 158 A86-18454
Development of a flight test maneuver autopilot for an F-15 aircraft [NASA-TM-86799] p 176 N86-14275

F-18 AIRCRAFT
Observations on helicopter integrated system testing based on F/A-18 experiences p 134 A86-18417

F-4 AIRCRAFT
2001 Phantom odyssey p 162 A86-17525

FACTORIZATION
An implicit finite-difference procedure for the numerical solution of unsteady supersonic flow over a blunt body p 148 N86-14229

FAILURE
The relationship between material failures and flight hours: Statistical considerations [AD-A159571] p 169 N86-15311

FAILURE ANALYSIS
Using diagnostic systems to collect data on the reliability of aircraft p 133 A86-16861
The relationship between material failures and flight hours: Statistical considerations [AD-A159571] p 169 N86-15311

FAILURE MODES
Full scle fatigue testing of advanced fiber composite components p 183 A86-18437
Failure mechanisms of laminates transversely loaded by bolt push-through [NASA-TM-87603] p 184 N86-14314

FATIGUE (MATERIALS)
Modelling for fatigue crack growth prediction in aircraft p 161 A86-17011
Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings p 134 A86-18430
Generic aspects of delamination in fatigue of composite materials p 183 A86-18432
Three-dimensional elastic-plastic finite-element analysis of fatigue crack propagation [NASA-CR-176415] p 189 N86-14687
Digital servocontroller system. Volume 1: Operations manual [AD-A158392] p 192 N86-14960

FATIGUE LIFE
US Army Flight Condition Monitoring p 170 A86-18435
Another look at generalized S-N curve shapes p 187 A86-18436
Use of a Service Life Assessment Program (SLAP) for identifying Service Life Extension Program (SLEP) procedures for fatigue sensitive airframe components p 134 A86-18442
Helicopter fatigue - The changing scene p 165 A86-18445
Damage tolerance analysis of components of rotor wing aircraft p 165 A86-18446
The application of fatigue damage tolerance concepts to helicopters - The approach proposed by the UK military airworthiness authorities p 165 A86-18447
Damage tolerance and civil helicopter design p 166 A86-18448

FATIGUE TESTING MACHINES
A computerized automatic control system for structural testing p 192 A86-18438
Methods of full scale fatigue testing the Apache helicopter rotor systems p 180 A86-18439
A rig for the fatigue testing of rotor hubs p 180 A86-18440

FATIGUE TESTS
Gear tooth surface fatigue testing with full size test specimens p 187 A86-18409
Helicopter drive system bench testing p 187 A86-18410
Torsional low cycle fatigue of spline-ended drive components p 187 A86-18431
Interpretation and evaluation of fatigue properties of cast, HIP and heat treated titanium UH-60A M. R. Hub p 183 A86-18434
Full scle fatigue testing of advanced fiber composite components p 183 A86-18437
Methods of full scale fatigue testing the Apache helicopter rotor systems p 180 A86-18439
Fatigue test of the Apache AH-64 airframe p 180 A86-18441
The AV-8B fatigue test program p 165 A86-18443
SH-2F airframe fatigue test plan p 165 A86-18444
Turbine blade thermal fatigue testing Pratt and Whitney aircraft hollow core blades [NASA-TM-86528] p 174 N86-14271
Digital servocontroller system. Volume 2. Maintenance manual [AD-A159066] p 179 N86-15322

FAULT TOLERANCE
Damage tolerance analysis of components of rotor wing aircraft p 165 A86-18446
The application of fatigue damage tolerance concepts to helicopters - The approach proposed by the UK military airworthiness authorities p 165 A86-18447
Damage tolerance and civil helicopter design p 166 A86-18448
Damage tolerance analysis of the H-53 helicopter p 166 A86-18449
A fault tolerant system for an integrated avionics sensor configuration [NASA-CR-3834] p 160 N86-15278

FEASIBILITY ANALYSIS
Avionics system for future civil helicopters [BMFT-FB-W-85-005] p 160 N86-14266

FEEDBACK
PIFCGT: A PIF autopilot design program for general aviation aircraft [NASA-CR-166123] p 178 N86-15320

FERROMAGNETIC RESONANCE
Ferromagnetic resonance probe liftoff suppression apparatus [AD-D011913] p 190 N86-15647

FIBER OPTICS
Development of optical diaphragm deflection sensors [NASA-CR-175008] p 194 N86-15113
Digital servocontroller system. Volume 2. Maintenance manual [AD-A159066] p 179 N86-15322

FIBER ORIENTATION
Stress concentration around a small circular hole in the HiMAT composite plate [NASA-TM-86038] p 184 N86-15350

FIBER REINFORCED COMPOSITES
Full scle fatigue testing of advanced fiber composite components p 183 A86-18437

FIBER STRENGTH
Manufacturing advance towards high strain fibers p 182 A86-16203

FIGHTER AIRCRAFT
Big Picture - Answer to the big problem? p 170 A86-17172
Testing time for AMX - The close support specialist moves towards production p 162 A86-17435
The fighter. II p 162 A86-17522
The fighter. III p 162 A86-17523
Characteristics of the design of VTOL jet aircraft --- Russian book p 162 A86-17600
The F/A-18 Fighter/Attack aircraft program [AD-A159292] p 195 N86-15205
Investigation of a supersonic cruise fighter model flow field [NASA-TM-86361] p 152 N86-15248
Numerical simulation of viscous supersonic flow over a generic fighter configuration [NASA-TM-86823] p 190 N86-15627

FILAMENT WINDING
Composite tail section offers superior performance p 133 A86-17379

FILM THICKNESS
Dynamic response of film thickness in spiral-groove face seals [NASA-TP-2544] p 174 N86-15313

**FINITE DIFFERENCE THEORY**

False diffusion in three-dimensional flow calculations p 143 A86-17653

A fourth-order scheme for the unsteady compressible Navier-Stokes equations [NASA-CR-177994] p 147 N86-14221

An implicit finite-difference procedure for the numerical solution of unsteady supersonic flow over a blunt body p 148 N86-14229

Calculation of separated laminar supersonic flows over blunt bodies of revolution at zero angle of attack [DFVLR-FB-85-30] p 151 N86-14256

**FINITE ELEMENT METHOD**

Experiments with several elements for viscous incompressible flows p 186 A86-16833

On the numerical solution of nonlinear problems in fluid dynamics by least squares and finite element methods. II Applications to transonic flow simulations p 144 A86-17886

A general purpose, multi-stage, component modal synthesis method p 186 A86-18124

Information-measurement complexes of flight vehicles --- Russian textbook p 172 A86-18743

**FLOQUET THEOREM**

Ground resonance analysis using a substructure modeling approach p 176 N86-15282

**FLOW CHARACTERISTICS**

Freestream turbulence effects on wake properties of a flat plate at an incidence p 142 A86-17132

Modification to the NASA Langley 4- by 7-meter tunnel for improved rotorcraft aerodynamics and acoustics p 179 A86-18414

**FLOW DEFLECTION**

Modification to the NASA Langley 4- by 7-meter tunnel for improved rotorcraft aerodynamics and acoustics p 179 A86-18414

Flow past caret wings with flaps p 146 A86-18903

**FLOW DISTORTION**

Vortices incident upon a leading edge - Instantaneous pressure fields p 141 A86-17060

**FLOW DISTRIBUTION**

An experimental study of geometrical effects on the drag and flow field of two bluff bodies separated by a gap p 141 A86-17055

A review of adaptive wall wind tunnels p 179 A86-17067

Computation of flowfields in high solidity and high turning angle cascades using Euler equations [AIAA PAPER 85-1705] p 144 A86-17847

Theoretical and experimental flow fields for a supersonic cruise fighter forebody [NASA-TM-86450] p 146 N86-14218

A model for closing the inviscid form of the average-passage equation system [NASA-TM-87199] p 147 N86-14224

Solutions of the Navier-Stokes equations with the finite volume method p 148 N86-14235

Comparison of the Euler and potential solutions for supersonic flows over delta wings p 149 N86-14239

Investigation of chemically-reacting supersonic internal flows [NASA-CR-176363] p 188 N86-14532

The experimental determination of the subsonic aerodynamic characteristics of an Ogive-Cylinder body including a comparison with theoretical estimates, volume 1 [CAR-8509] p 151 N86-15242

Investigation of a supersonic cruise fighter model flow field [NASA-TM-86361] p 152 N86-15248

Fundamental study of flow field generated by rotorcraft blades using wide-field shadowgraph [NASA-CR-176443] p 152 N86-15249

Test cases for inviscid flow field methods [AGARD-AR-211] p 153 N86-15256

Objectives and scope of the Working Group 07 p 153 N86-15257

Formulation of the Euler boundary value problem p 154 N86-15258

Numerical methods p 154 N86-15259

Exact solutions to transonic and supersonic flows p 154 N86-15260

Reference test cases and contributors p 154 N86-15261

Numerical solutions of two-dimensional reference test cases p 154 N86-15262

Numerical solutions for three-dimensional cases: Swept wings p 154 N86-15263

Numerical solutions for three-dimensional cases: Delta wings p 155 N86-15264

Concluding remarks p 155 N86-15265

Boundary-layer transition: T-S waves and crossflow mechanisms p 155 N86-15266

**FLOW EQUATIONS**

False diffusion in three-dimensional flow calculations p 143 A86-17653

A model for closing the inviscid form of the average-passage equation system
[NASA-TM-87199] p 147 N86-14224

**FLOW GEOMETRY**
Experiments on unsteady flows about wing sections p 138 A86-16318
Attached cavitation and the boundary layer - Experimental investigation and numerical treatment p 186 A86-17032

**FLOW MEASUREMENT**
L.D.A. measurements in the turbulent near-wake of blunt bodies p 139 A86-16371
Mean flow properties measured around an aerofoil close to its maximum lift p 140 A86-16395
Longitudinal vortices imbedded in turbulent boundary layers. I - Single vortex p 186 A86-17043
An experimental study of geometrical effects on the drag and flow field of two bluff bodies separated by a gap p 141 A86-17055
Mean-flow measurements in a supersonic three-dimensional turbulent boundary layer p 141 A86-17059
Transonic rotor flow-measurement technique using holographic interferometry p 141 A86-17069
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17845

**FLOW VELOCITY**
Experimental analysis of tip vortex by laser Doppler anemometry p 140 A86-16387
Study of high speed combustion flows by laser velocimetry
[NASA-CR-176439] p 190 N86-15668

**FLOW VISUALIZATION**
Separation bubble behavior for a NACA 23009 airfoil p 137 A86-16312
Experiments on unsteady flows about wing sections p 138 A86-16318
Streamwise and spanwise vortical patterns visualized over airfoils in unsteady flow p 138 A86-16319
Attached cavitation and the boundary layer - Experimental investigation and numerical treatment p 186 A86-17032
The vortex patterns of dynamic separation - A parametric and comparative study p 145 A86-18534

**FLUID DYNAMICS**
Relative advantages of thin-layer Navier-Stokes and interactive boundary-layer procedures
[NASA-TM-86778] p 152 N86-15244
Formulation of the Euler boundary value problem p 154 N86-15258

**FLUID FLOW**
Programming a multiple-orifice hydraulic decelerator
[AD-A159428] p 181 N86-15328

**FLUIDICS**
Three-axis electrofluidic angular rate sensor for ejection seat steering thrust vector control
[AD-A159413] p 159 N86-15277

**FLUTTER**
Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover p 177 N86-15286
Flutter generator control and force computer
[AEL-0242-TM] p 178 N86-15318

**FLUTTER ANALYSIS**
An airfoil flutter model suspension system to accommodate large static transonic airloads
[NASA-CR-177998] p 146 N86-14220

**FLY BY WIRE CONTROL**
For agile read active — control of military helicopters p 175 A86-17175
Integrated Application of Active Controls (IAAC) technology to an advanced subsonic transport project: Test act system description
[NASA-CR-172221] p 176 N86-14277

**FORMAT**
Display formats and information transfer requirements as they relate to mission, aircrew and aircraft type p 171 A86-18464

**FORTRAN**
PIFCGT: A PIF autopilot design program for general aviation aircraft
[NASA-CR-166123] p 178 N86-15320

**FRACTURE MECHANICS**
Generic aspects of delamination in fatigue of composite materials p 183 A86-18432

**FRACTURE STRENGTH**
Interpretation and evaluation of fatigue properties of cast, HIP and heat treated titanium UH-60A M. R. Hub p 183 A86-18434

**FREE FLOW**
Freestream turbulence effects on wake properties of a flat plate at an incidence p 142 A86-17132
Determination of the intensity of a free vortex sheet in the context of airfoil theory p 146 A86-18904

A consistent spatial differencing scheme for the transonic full-potential equation in three dimensions
[NASA-TM-86716] p 152 N86-15246
Numerical methods p 154 N86-15259
Numerical simulation of viscous supersonic flow over a generic fighter configuration
[NASA-TM-86823] p 190 N86-15627

**FREE JETS**
Evaluation of a correction for sound propagation through free-jet shear layers p 193 A86-17783

**FUEL COMBUSTION**
Fuel effects on soot formation in turbojet engines
[AD-A159073] p 185 N86-15416

**FUEL CONSUMPTION**
Propulsion for advanced commercial transports
[AIAA PAPER 85-3061] p 173 A86-17829
Fuel saving by optimal integration of on-board avionics and air traffic control
[NLR-MP-84035-U] p 159 N86-14263

**FUEL TESTS**
Development of new combustor technologies for application to alternative aeroengine fuels, phase 1
[BMFT-FB-W-85-004] p 184 N86-14402

**FUEL-AIR RATIO**
Fuel effects on soot formation in turbojet engines
[AD-A159073] p 185 N86-15416

**FULL SCALE TESTS**
An environmental aerodynamic test system for low-Reynolds-number applications p 138 A86-16315
A structured approach for integration and test of avionics systems p 170 A86-18423

**FUNCTIONS (MATHEMATICS)**
Simple approximations of functions with additional constraints p 192 A86-18918

**FURFURYL ALCOHOL**
Furfuryl alcohol polymer concretes for use in all-weather repairs of concrete and asphalt surfaces
[DE85-014825] p 184 N86-14391

**FUSELAGES**
SH-2F airframe fatigue test plan p 165 A86-18444
Failure mechanisms of laminates transversely loaded by bolt push-through
[NASA-TM-87603] p 184 N86-14314
The use of active controls to augment rotor/fuselage stability p 176 N86-15281
Influence of various unsteady aerodynamic models on the aeromechanical stability of a helicopter in ground resonance p 177 N86-15294

## G

**CAS BEARINGS**
Dynamic response of film thickness in spiral-groove face seals
[NASA-TP-2544] p 174 N86-15313

**GAS DYNAMICS**
Self-similar supersonic gas flows through a permeable screen p 140 A86-16784

**GAS TEMPERATURE**
Dynamic gas temperature measurement system. Volume 2: Operation and program manual
[NASA-CR-168267] p 190 N86-15651

**GAS TURBINE ENGINES**
Coating requirements in gas turbine engines p 173 A86-17490
Flame rig testing of thermal barrier coatings and correlation with engine results p 173 A86-17491
Heat transfer in cooled parts of aircraft gas-turbine engines --- Russian book p 174 A86-18745
Stability of limit cycles in frictionally damped and aerodynamically unstable rotor stages p 174 A86-19198
Resonant cavities for stall recovery in gas turbine engines
[AD-D011691] p 175 N86-15317

**GAS TURBINES**
Small turbine technology review
[AD-A158514] p 175 N86-15316
Heat transfer characteristics within an array of impinging jets. Effects of crossflow temperature relative to jet temperature
[NASA-CR-3936] p 190 N86-15625

**GASOLINE**
Aircraft accident report: Vieques Air Link, Inc., Britten-Norman BN-21-6 Islander, N589SA, Vieques, Puerto Rico, August 2, 1984
[PB85-901408] p 159 N86-15276

**GEAR TEETH**
Gear tooth surface fatigue testing with full size test specimens p 187 A86-18409

**GENERAL AVIATION AIRCRAFT**
Damage tolerance and civil helicopter design p 166 A86-18448
Determination of corrections to flow direction sensor measurements over an angle-of-attack range from 0 degree to 85 degrees
[NASA-TM-86402] p 167 N86-14267
01General aviation interior noise problem: Some suggested solutions p 194 N86-15053
PIFCGT: A PIF autopilot design program for general aviation aircraft
[NASA-CR-166123] p 178 N86-15320

**GEOMETRY**
Aeroelastic considerations for torsionally soft rotors p 157 N86-15289

**GLIDING**
Stability of the steady-state gliding of a flight vehicle p 175 A86-16787

**GOVERNMENT PROCUREMENT**
The F/A-18 Fighter/Attack aircraft program
[AD-A159292] p 195 N86-15205

**GRAPHITE-EPOXY COMPOSITES**
Flight service evaluation of advanced composite ailerons on the L-1011 transport aircraft
[NASA-CR-177960] p 184 N86-14317
Stress concentration around a small circular hole in the HiMAT composite plate
[NASA-TM-86038] p 184 N86-15350

**GROOVES**
Dynamic response of film thickness in spiral-groove face seals
[NASA-TP-2544] p 174 N86-15313

**GROUND RESONANCE**
Ground resonance analysis using a substructure modeling approach p 176 N86-15282
Nonlinear dynamics of a helicopter model in ground resonance p 177 N86-15284
Development and application of a time-history analysis for rotorcraft dynamics based on a component approach p 168 N86-15291

**GUIDANCE (MOTION)**
An analytical modularized treatment of autopilots for guided projectile simulations
[AD-A159311] p 182 N86-14282

**GYROCOMPASSES**
Analytical estimation of the variance of error in determining geographic-meridian direction by the gyrocompass method with random oscillation of the base p 160 A86-18990

**GYROSCOPES**
Stability of large damped flexible spacecraft with stored angular momentum p 162 A86-18355

**GYROSTABILIZERS**
Spatial orientation of an aircraft during the execution of lateral maneuvers p 175 A86-18987

## H

**H-53 HELICOPTER**
Damage tolerance analysis of the H-53 helicopter p 166 A86-18449

**H-60 HELICOPTER**
Development testing of the H-60 composite main rotor blade p 163 A86-18404

**HARMONIC CONTROL**
Adaptation of a modern medium helicopter (Sikorsky S-76) to higher harmonic control p 178 N86-15303

**HARRIER AIRCRAFT**
The AV-8B fatigue test program p 165 A86-18443

**HEAD-UP DISPLAYS**
HMD: Global HUD solution p 171 A86-18460

**HEAT TRANSFER**
Analysis of the effects of transient heat transfer on axial flow compressor blade boundary layers
[AD-A158094] p 175 N86-15315
Heat transfer characteristics within an array of impinging jets. Effects of crossflow temperature relative to jet temperature
[NASA-CR-3936] p 190 N86-15625

**HEAT TRANSFER COEFFICIENTS**
Heat transfer in cooled parts of aircraft gas-turbine engines --- Russian book p 174 A86-18745
Heat transfer at the lateral surface of a blunt cone during the absorption of the entropy layer by a laminar or a turbulent boundary layer p 167 A86-18907
Dynamic gas temperature measurement system. Volume 2: Operation and program manual
[NASA-CR-168267] p 190 N86-15651

**HEATING EQUIPMENT**
Aircraft compartment preheating device LUVO 100 p 180 A86-18722

**HEAVY LIFT HELICOPTERS**
Testing large transmissions p 187 A86-18426

**HELICOPTER CONTROL**
For agile read active --- control of military helicopters p 175 A86-17175
The use of active controls to augment rotor/fuselage stability p 176 N86-15281

**HELICOPTER DESIGN**
Composite tail section offers superior performance p 133 A86-17379
National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings p 163 A86-18401
Developmental testing for composite frames --- of helicopters p 163 A86-18403
Observations on helicopter integrated system testing based on F/A-18 experiences p 134 A86-18417
R&M test data management during helicopter system development p 164 A86-18419
The role of simulation for the LHX p 164 A86-18421
Simulating the total system, warts and all --- automatic target acquisition for LHX helicopter p 164 A86-18422
Testing large transmissions p 187 A86-18426
The wind tunnel as a design tool p 179 A86-18429
Torsional low cycle fatigue of spline-ended drive components p 187 A86-18431
Generic aspects of delamination in fatigue of composite materials p 183 A86-18432
US Army Flight Condition Monitoring p 170 A86-18435
Damage tolerance analysis of components of rotor wing aircraft p 165 A86-18446
The application of fatigue damage tolerance concepts to helicopters - The approach proposed by the UK military airworthiness authorities p 165 A86-18447
Damage tolerance and civil helicopter design p 166 A86-18448
Specialists' Meeting on Advanced Cockpit Design, Grapevine, Tex, October 3, 4, 1984, Proceedings p 170 A86-18451
Tomorrow's cockpit technology in today's modern helicopter p 166 A86-18457
Helicopter cockpit avionics development or the advanced transport and next generation aircraft p 171 A86-18461
Advanced technology cockpit simulator p 180 A86-18462
Hughes helicopters AH-64A electroluminescent lighting p 171 A86-18463
System partitioning to provide for automatic mission and vehicle management p 175 A86-18465
Activities report in aerospace research p 135 N86-15240
Rotorcraft Dynamics 1984 [NASA-CP-2400] p 167 N86-15280
Nonlinear dynamics of a helicopter model in ground resonance p 177 N86-15284
Optimal design application on the advanced aeroelastic rotor blade p 167 N86-15290
Development and application of a time-history analysis for rotorcraft dynamics based on a component approach p 168 N86-15291

**HELICOPTER ENGINES**
Drive train simulation requirements for development of helicopter overrunning clutches p 186 A86-17071
FAA certification of rotorcraft engine induction system for ice protection p 157 A86-18406
Gear tooth surface fatigue testing with full size test specimens p 187 A86-18409
Helicopter drive system bench testing p 187 A86-18410
Testing large transmissions p 187 A86-18426

**HELICOPTER PERFORMANCE**
Helicopter performance --- Book p 161 A86-16210
28 years of flight testing helicopters p 161 A86-17381
Helicopter linear noise p 193 A86-17776
Dynamic interface - Conventional flight testing plus a new analytical approach p 163 A86-18405
Hovering model helicopter rotor testing p 179 A86-18412
Reliability development testing of SH-60B helicopter mechanical systems p 164 A86-18420
Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data [NASA-TM-86816] p 188 N86-14555
Rotorcraft Dynamics 1984 [NASA-CP-2400] p 167 N86-15280
Optimal design application on the advanced aeroelastic rotor blade p 167 N86-15290
Light helicopter family trade-off analysis. Volume 4: Appendix N [AD-A158075] p 168 N86-15306

**HELICOPTER PROPELLER DRIVE**
Torsional low cycle fatigue of spline-ended drive components p 187 A86-18431

**HELICOPTER TAIL ROTORS**
Pultrusion used to fabricate tail rotor spar p 133 A86-17380
Methods of full scale fatigue testing the Apache helicopter rotor systems p 180 A86-18439

**HELICOPTERS**
Model constraints on structural dynamic force determination p 181 A86-17070
Aeroelastic model helicopter rotor testing in the Langley TDT --- Transonic Dynamics Tunnel p 163 A86-18402
Modification to the NASA Langley 4- by 7-meter tunnel for improved rotorcraft aerodynamics and acoustics p 179 A86-18414
Helicopter Fatigue Specialists' Meeting, St. Louis, MO, October 16-18, 1984, Proceedings p 134 A86-18430
Another look at generalized S-N curve shapes p 187 A86-18436
Full scle fatigue testing of advanced fiber composite components p 183 A86-18437
A computerized automatic control system for structural testing p 192 A86-18438
A rig for the fatigue testing of rotor hubs p 180 A86-18440
Helicopter fatigue - The changing scene p 165 A86-18445
Wide-angle, low-altitude flight simulator vision system for cockpit research and aircrew training p 180 A86-18453
Aeroelasticity and dynamics of the helicopter structure --- Russian book p 166 A86-18733
Computer program for performance prediction of tandem-rotor helicopters [AD-A159193] p 167 N86-14268
An optimisation method for reconstruction of flight path trajectories from non-synchronous time-sampled observations by two cine cameras [ARL-SYS-R-34] p 167 N86-15279
Influence of various unsteady aerodynamic models on the aeromechanical stability of a helicopter in ground resonance p 177 N86-15294
Flap-lag-torsion stability in forward flight p 177 N86-15296
An examination of the relations between rotor vibratory loads and airframe vibrations p 177 N86-15299
Coupled rotor-body vibrations with inplane degrees of freedom p 177 N86-15301
Analysis of potential helicopter vibration reduction concepts p 178 N86-15302
Adaptation of a modern medium helicopter (Sikorsky S-76) to higher harmonic control p 178 N86-15303
Light helicopter family trade-off analysis. Volume 7: Appendix R [AD-A158076] p 168 N86-15307
Light helicopter family trade-off analysis. Volume 8: Appendices S and T [AD-A158077] p 169 N86-15308
Light helicopter family trade-off analysis. Volume 10: Appendices V, W, X, and Z [AD-A158079] p 169 N86-15309
VHF-AM communications equipment selection and installation practices for helicopters [DOT/FAA/PM-85/8] p 169 N86-15518

**HELIUM**
Hypersonic characteristics of an advanced aerospace plane at Mach 20.3 [NASA-TM-86435] p 152 N86-15245

**HELMET MOUNTED DISPLAYS**
HMD: Global HUD solution p 171 A86-18460

**HERMETIC SEALS**
Development of optical diaphragm deflection sensors [NASA-CR-175008] p 194 N86-15113

**HIGH ALTITUDE TESTS**
Alternate altitude testing of solid cloth parachute systems [AD-A157068] p 150 N86-14251

**HIGH PRESSURE**
Preliminary design of a supersonic cruise aircraft high-pressure turbine [NASA-CR-174878] p 174 N86-14272

**HIGH SPEED**
Investigation of chemically-reacting supersonic internal flows [NASA-CR-176363] p 188 N86-14532

**HIGH TEMPERATURE**
Development of optical diaphragm deflection sensors [NASA-CR-175008] p 194 N86-15113

**HIGHLY MANEUVERABLE AIRCRAFT**
Stress concentration around a small circular hole in the HiMAT composite plate [NASA-TM-86038] p 184 N86-15350

**HISTORIES**
Claude Dornier - Pioneer of aviation; Academic Seminar, Technische Universitaet Muenchen, Munich, West Germany, October 24, 1984, Papers p 195 A86-16325
The fighter. II p 162 A86-17522
The fighter. III p 162 A86-17523
Lizzy - The first British liquid propellant rocket motor p 195 A86-18481
The F/A-18 Fighter/Attack aircraft program [AD-A159292] p 195 N86-15205

**HOLE GEOMETRY (MECHANICS)**
Stress concentration around a small circular hole in the HiMAT composite plate [NASA-TM-86038] p 184 N86-15350

**HOLOGRAPHIC INTERFEROMETRY**
Transonic rotor flow-measurement technique using holographic interferometry p 141 A86-17069
Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data [NASA-TM-86816] p 188 N86-14555

**HORIZONTAL FLIGHT**
The influence of forward flight on thrust augmenting ejectors [AIAA PAPER 85-1589] p 173 A86-17843

**HORIZONTAL ORIENTATION**
Programming a multiple-orifice hydraulic decelerator [AD-A159428] p 181 N86-15328

**HORSEPOWER**
Computer program for performance prediction of tandem-rotor helicopters [AD-A159193] p 167 N86-14268

**HOT-WIRE ANEMOMETERS**
Propeller slipstream/wing boundary layer effects at low Reynolds numbers p 139 A86-16324

**HOVERING**
Transonic rotor flow-measurement technique using holographic interferometry p 141 A86-17069
Hovering model helicopter rotor testing p 179 A86-18412
Performance and loads data from a hover test of a full-scale XV-15 rotor [NASA-TM-86833] p 152 N86-15243
Test results from a dynamic model dynaflex rotor p 167 N86-15285
Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover p 177 N86-15286
Dynamic stability of a bearingless circulation control rotor blade in hover p 177 N86-15297

**HUBS**
A rig for the fatigue testing of rotor hubs p 180 A86-18440
Evaluation of a load cell model for dynamic calibration of the rotor systems research aircraft p 168 N86-15304

**HUMAN FACTORS ENGINEERING**
Big Picture - Answer to the big problem? p 170 A86-17172
The interactive generation of alphanumerics and symbology with designs on the future [AD-A159218] p 192 N86-14982
Light helicopter family trade-off analysis. Volume 7: Appendix R [AD-A158076] p 168 N86-15307

**HYDRAULIC EQUIPMENT**
Programming a multiple-orifice hydraulic decelerator [AD-A159428] p 181 N86-15328

**HYDRODYNAMICS**
Turbulent drag reduction for external flows p 156 N86-15271

**HYDROGEN OXYGEN ENGINES**
Turbine blade thermal fatigue testing Pratt and Whitney aircraft hollow core blades [NASA-TM-86528] p 174 N86-14271

**HYDROPLANING**
High-speed braking of an aircraft tire on grooved surfaces p 162 A86-17787

**HYDROSTATIC PRESSURE**
Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel p 184 N86-15346

**HYPERSONIC FLOW**
Static and dynamic pitch stability of a blunted cone with forward facing aerodynamic spike in hypersonic flow p 135 A86-16249
A comparative study of the parabolized Navier-Stokes code using various grid-generation techniques p 143 A86-17654

**HYPERSONIC WIND TUNNELS**
Hypersonic characteristics of an advanced aerospace plane at Mach 20.3 [NASA-TM-86435] p 152 N86-15245

**HYPERVELOCITY FLOW**
Quasi nonstretching hypervelocity jets [ISL-CO-236/84] p 153 N86-15254

**HYPERVELOCITY PROJECTILES**
Damping of the rolling motion of full caliber fin-stabilized projectiles in supersonic flight [ISL-CO-233/84] p 153 N86-15253

**I**

**ICE FORMATION**
New techniques for optimization and certification of helicopters in icing conditions p 164 A86-18416

Formation and characterization of simulated small droplet icing clouds
[NASA-TM-87180] p 188 N86-14554
Results of icing flights in winter 1983/84: Ice accretion thickness in correlation with cloud physical parameters, object and cloud parameters
[DFVLR-FB-85-39] p 191 N86-15838

**ICE PREVENTION**
FAA certification of rotorcraft engine induction system for ice protection p 157 A86-18406

**ICE REPORTING**
Results of icing flights in winter 1983/84: Ice accretion thickness in correlation with cloud physical parameters, object and cloud parameters
[DFVLR-FB-85-39] p 191 N86-15838

**IMPACT LOADS**
Finite element analysis of soft-body impact
[AD-A158438] p 158 N86-14259

**IMPACT TESTS**
Contribution to the potential calculation of anisotropic compression shocks in a plane case
p 150 N86-14245

**IN-FLIGHT MONITORING**
Flight evaluation of a digital electronic engine control in an F-15 airplane p 173 A86-17784
US Army Flight Condition Monitoring
p 170 A86-18435

**INCIDENCE**
Freestream turbulence effects on wake properties of a flat plate at an incidence p 142 A86-17132

**INCOMPRESSIBLE FLOW**
Experiments with several elements for viscous incompressible flows p 186 A86-16833
Vortex-fitted potential and vortex-captured Euler solution for leading-edge vortex flow p 142 A86-17149
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17836
Determination of the intensity of a free vortex sheet in the context of airfoil theory p 146 A86-18804
Solutions of the Navier-Stokes equations for vortical flow p 148 N86-14231

**INFORMATION SYSTEMS**
Information-measurement complexes of flight vehicles — Russian textbook p 172 A86-18743

**INJURIES**
Injury pattern analysis of helicopter wire strike accidents (+Gz load) p 158 A86-18843

**INSPECTION**
Effectiveness of the civil aviation security program
[AD-A158511] p 158 N86-14260
Compilation and analysis of the Federal Aviation Administration's inspection of a sample of commercial air carriers
[PB85-241198] p 159 N86-14264

**INSTRUMENT ERRORS**
Analytical estimation of the variance of error in determining geographic-meridian direction by the gyrocompass method with random oscillation of the base p 160 A86-18990

**INSTRUMENT LANDING SYSTEMS**
The Microwave Landing System (MLS)
p 160 A86-18723

**INSULATION**
Coating requirements in gas turbine engines
p 173 A86-17490

**INTERACTIONAL AERODYNAMICS**
Symmetry breaking and lift hysteresis arising from massive laminar separation - A study of multiple steady-state solutions p 138 A86-16316
Experimental analysis of tip vortex by laser Doppler anemometry p 140 A86-16387
The effect of a shock layer on the viscous resistance of star-shaped bodies with flat side faces
p 140 A86-16691
Turbulent-boundary-layer development in an adverse pressure gradient after an interaction with a normal shock wave p 141 A86-17031
Vortices incident upon a leading edge - Instantaneous pressure fields p 141 A86-17080
Structure of a supersonic turbulent boundary layer during its interaction with a shock wave p 141 A86-17096
Supercritical mode of the nonlinear interaction of subsonic and supersonic inviscid jets in a two-dimensional channel p 142 A86-17098
Calculation of three-dimensional shock/turbulent boundary-layer interaction generated by sharp fin
p 142 A86-17135
Supersonic viscous-inviscid interaction of a swept compression ramp with a turbulent boundary layer
[AIAA PAPER 85-1669] p 143 A86-17826
Shock wave/turbulent boundary layer interaction and its control p 145 A86-18595

**INTERFACES**
Navy aircraft support data systems study: ECAMS/NALCOMIS integration feasibility and procedure
[DE85-016877] p 192 N86-15003

**INTERFERENCE DRAG**
Aircraft Drag Prediction and Reduction
[AGARD-R-723] p 155 N86-15266
Parasitic and interference drag prediction and reduction p 156 N86-15272

**INTERFERENCE LIFT**
Integrated wing engine system (IFAS), phase 2
[BMFT-FB-W-85-008] p 151 N86-14257

**INTERLAYERS**
Interleaf technology for carbon composite aircraft primary structure p 182 A86-16208
Failure mechanisms of laminates transversely loaded by bolt push-through
[NASA-TM-87603] p 184 N86-14314

**INTERNAL COMBUSTION ENGINES**
Investigation of chemically-reacting supersonic internal flows
[NASA-CR-176363] p 188 N86-14532
Aircraft accident report: Vieques Air Link, Inc., Britten-Norman BN-21-6 Islander, N589SA, Vieques, Puerto Rico, August 2, 1984
[PB85-901408] p 159 N86-15276

**INTERNATIONAL COOPERATION**
The V2500 engine p 173 A86-17750

**INTERPOLATION**
A new Euler algorithm based on characteristic flux extrapolation p 149 N86-14241

**INVESTIGATION**
Investigation of chemically-reacting supersonic internal flows
[NASA-CR-176363] p 188 N86-14532

**INVISCID FLOW**
A viscous-inviscid coupling method for the design of low Reynolds number airfoil sections
p 136 A86-16305
On a weak solution for a transonic flow problem
p 143 A86-17738
Supersonic viscous-inviscid interaction of a swept compression ramp with a turbulent boundary layer
[AIAA PAPER 85-1669] p 143 A86-17826
Computation of flowfields in high solidity and high turning angle cascades using Euler equations
[AIAA PAPER 85-1705] p 144 A86-17847
Some recent developments in numerical methods for transonic flows p 144 A86-17889
Numerical approximation of the total drag of a body in a tube
[AD-A159548] p 188 N86-14538
Test cases for inviscid flow field methods
[AGARD-AR-211] p 153 N86-15256
Objectives and scope of the Working Group 07
p 153 N86-15257
Prediction of the drag of wings at subsonic speeds by viscous/inviscid interaction techniques
p 156 N86-15274

## J

**JACOBI MATRIX METHOD**
A study of aircraft motion stability in steady spin
p 176 A86-19070

**JAMMING**
Toward an avionics supersystem p 172 A86-18552

**JET AIRCRAFT**
A study of the operating condition of aircraft from the recordings of the onboard recording equipment
p 133 A86-16859
Characteristics of the design of VTOL jet aircraft --- Russian book p 162 A86-17600

**JET AIRCRAFT NOISE**
Tone excited jets. I - Introduction p 193 A86-16466
Tone excited jets. IV - Acoustic measurements
p 193 A86-16469
A linearized theory for swirling supersonic jets and its application to shock-cell noise p 186 A86-17137
Discrete tones generated by an impinging underexpanded rectangular jet p 193 A86-17138

**JET ENGINE FUELS**
The temperature dependence of the electrical conductivity of jet fuels with antistatic additives
p 183 A86-16750
Development of new combustor technologies for application to alternative aeroengine fuels, phase 1
[BMFT-FB-W-85-004] p 184 N86-14402
Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel
p 184 N86-15346
Antimisting kerosene: Development of a continuous 10 GPM in-line blender
[NASA-CR-176432] p 185 N86-15412
Variability of major organic components in aircraft fuels
[AD-A159057] p 185 N86-15415
Fuel effects on soot formation in turbojet engines
[AD-A159073] p 185 N86-15416

**JET ENGINES**
Thermal barrier coatings for jet engine improvement
p 183 A86-16278
Acta aeronautica et astronautic sinica (selected articles)
[AD-A158454] p 135 N86-14216
An analysis of cross-coupling of a multicomponent jet engine test stand using finite element modeling techniques
[NASA-CR-176424] p 181 N86-15323

**JET FLAPS**
Velocity and temperature decay characteristics of inverted-profile jets
[NASA-TM-87159] p 147 N86-14223

**JET FLOW**
Velocity and temperature decay characteristics of inverted-profile jets
[NASA-TM-87159] p 147 N86-14223
Quasi nonstretching hypervelocity jets
[ISL-CO-236/84] p 153 N86-15254

**JET IMPINGEMENT**
Discrete tones generated by an impinging underexpanded rectangular jet p 193 A86-17138
Heat transfer characteristics within an array of impinging jets. Effects of crossflow temperature relative to jet temperature
[NASA-CR-3936] p 190 N86-15625

**JOINTS (JUNCTIONS)**
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements
[AD-A158004] p 181 N86-15324

**JUDGMENTS**
Recent developments in aviation case law
p 194 A86-18848

## K

**KERNEL FUNCTIONS**
Nonplanar, subsonic, three-dimensional oscillatory piecewise continuous kernel function method
p 162 A86-17779

**KEROSENE**
Antimisting kerosene: Development of a continuous 10 GPM in-line blender
[NASA-CR-176432] p 185 N86-15412

**KUTTA-JOUKOWSKI CONDITION**
Contribution to the potential calculation of anisotropic compression shocks in a plane case
p 150 N86-14245

## L

**L-1011 AIRCRAFT**
Flight service evaluation of advanced composite ailerons on the L-1011 transport aircraft
[NASA-CR-177960] p 184 N86-14317

**LAMINAR BOUNDARY LAYER**
Propeller slipstream/wing boundary layer effects at low Reynolds numbers p 139 A86-16324
A compressible laminar boundary layer on a plane triangular plate with an attached shock wave
p 146 A86-18902
Heat transfer at the lateral surface of a blunt cone during the absorption of the entropy layer by a laminar or a turbulent boundary layer p 187 A86-18907
Laminar flow control with suction: Theory and experiment p 155 N86-15269
Design considerations for application of laminar flow control systems to transport aircraft p 155 N86-15270

**LAMINAR FLOW**
Low Reynolds number airfoil design
p 136 A86-16303
A viscous-inviscid coupling method for the design of low Reynolds number airfoil sections
p 136 A86-16305
Research on laminar separation bubbles at Delft University of Technology in relation to low Reynolds number airfoil aerodynamics p 137 A86-16308
Symmetry breaking and lift hysteresis arising from massive laminar separation - A study of multiple steady-state solutions p 138 A86-16316
Surface wetting effects on a laminar flow airfoil in simulated heavy rain p 162 A86-17780
Aircraft Drag Prediction and Reduction
[AGARD-R-723] p 155 N86-15266
Aircraft drag reduction technology: A summary
p 155 N86-15267

F-111 natural laminar flow glove flight test data analysis and boundary layer stability analysis
[NASA-CR-166051] p 168 N86-15305

**LAMINATES**

Failure mechanisms of laminates transversely loaded by bolt push-through
[NASA-TM-87603] p 184 N86-14314

Stress concentration around a small circular hole in the HiMAT composite plate
[NASA-TM-86038] p 184 N86-15350

**LANDING GEAR**

Use of a Service Life Assessment Program (SLAP) for identifying Service Life Extension Program (SLEP) procedures for fatigue sensitive airframe components p 134 A86-18442

Influence of rough runways on undercarriage design p 166 A86-19277

Nonlinear dynamics of a helicopter model in ground resonance p 177 N86-15284

**LANDING SIMULATION**

Investigations of the aircraft landing process using a computerized simulation model based on the Monte Carlo method
[DFVLR-FB-85-27] p 167 N86-14269

**LASER DAMAGE**

A methodology for analyzing laser-induced structural damage p 186 A86-17791

**LASER DOPPLER VELOCIMETERS**

The application of laser anemometry to the study of transonic shock boundary-layer interactions p 139 A86-16352

L.D.A. measurements in the turbulent near-wake of blunt bodies p 139 A86-16371

Experimental analysis of tip vortex by laser Doppler anemometry p 140 A86-16387

Mean flow properties measured around an aerofoil close to its maximum lift p 140 A86-16395

West Europe report: Science and technology
[JPRS-WST-85-024] p 189 N86-15447

Study of high speed combustion flows by laser velocimetry
[NASA-CR-176439] p 190 N86-15668

**LATERAL CONTROL**

Damping of the rolling motion of full caliber fin-stabilized projectiles in supersonic flight
[ISL-CO-233/84] p 153 N86-15253

Use of hinged strakes for lateral control at high angles of attack
[AD-A158005] p 178 N86-15321

**LATERAL STABILITY**

Hypersonic characteristics of an advanced aerospace plane at Mach 20.3
[NASA-TM-86435] p 152 N86-15245

**LEADING EDGE FLAPS**

Use of hinged strakes for lateral control at high angles of attack
[AD-A158005] p 178 N86-15321

**LEADING EDGES**

Vortices incident upon a leading edge - Instantaneous pressure fields p 141 A86-17060

Solutions of the Navier-Stokes equations for vortical flow p 148 N86-14231

Numerical calculation of leading-edge vortices on a flat delta wing p 148 N86-14232

Procedure for solution of the Euler equations at Dornier GmbH p 149 N86-14242

Design considerations for application of laminar flow control systems to transport aircraft p 155 N86-15270

**LEAST SQUARES METHOD**

On the numerical solution of nonlinear problems in fluid dynamics by least squares and finite element methods. II Applications to transonic flow simulations p 144 A86-17886

**LIFT**

Lifting surface theory for a helicopter rotor in forward flight p 156 N86-15287

Prediction of wing aeroelastic effects on aircraft lift and pitching moment characteristics
[NASA-TM-87631] p 178 N86-15319

Ferromagnetic resonance probe liftoff suppression apparatus
[AD-D011913] p 190 N86-15647

**LIFT DRAG RATIO**

Surface wetting effects on a laminar flow airfoil in simulated heavy rain p 162 A86-17780

**LIFTING BODIES**

Lifting surface theory for a helicopter rotor in forward flight p 156 N86-15287

**LIGHT AIRBORNE MULTIPURPOSE SYSTEM**

A structured approach for integration and test of avionics systems p 170 A86-18423

**LIGHT AIRCRAFT**

The role of simulation for the LHX p 164 A86-18421

Analytical methods for LHX mission and task analysis p 157 A86-18452

Light helicopter family trade-off analysis. Volume 4: Appendix N
[AD-A158075] p 168 N86-15306

Light helicopter family trade-off analysis. Volume 6: Appendices S and T
[AD-A158077] p 169 N86-15308

**LIGHT EMITTING DIODES**

Advanced light emitting diode (LED) displays-paced by technology or systems application? p 171 A86-18458

**LIGHTING EQUIPMENT**

Hughes helicopters AH-64A electroluminescent lighting p 171 A86-18463

**LIGHTNING**

Mobile intercept of storms p 191 N86-15771

**LINEAR EQUATIONS**

Simple approximations of functions with additional constraints p 192 A86-18918

**LINEARIZATION**

A linearized theory for swirling supersonic jets and its application to shock-cell noise p 186 A86-17137

**LIQUID PROPELLANT ROCKET ENGINES**

Lizzy - The first British liquid propellant rocket motor p 195 A86-18481

**LOAD TESTS**

Developmental testing for composite frames --- of helicopters p 163 A86-18403

Verification of static rotor-load measurement capabilities of the RSRA helicoptar active-isolator system p 165 A86-18428

Digital servocontroller system. Volume 1: Operations manual
[AD-A158392] p 192 N86-14960

Digital servocontroller system. Volume 2. Maintenance manual
[AD-A159066] p 179 N86-15322

**LOADING MOMENTS**

The experimental determination of the subsonic aerodynamic characteristics of an Ogive-Cylinder body including a comparison with theoretical estimates, volume 1
[CAR-8509] p 151 N86-15242

**LOADS (FORCES)**

Failure mechanisms of laminates transversely loaded by bolt push-through
[NASA-TM-87603] p 184 N86-14314

An examination of the relations between rotor vibratory loads and airframe vibrations p 177 N86-15299

Analysis of potential helicopter vibration reduction concepts p 178 N86-15302

Adaptation of a modern medium helicopter (Sikorsky S-76) to higher harmonic control p 178 N86-15303

Evaluation of a load cell model for dynamic calibration of the rotor systems research aircraft p 168 N86-15304

Digital servocontroller system. Volume 2. Maintenance manual
[AD-A159066] p 179 N86-15322

**LOCKHEED AIRCRAFT**

Stealth p 134 A86-17434

**LONGITUDINAL STABILITY**

Hypersonic characteristics of an advanced aerospace plane at Mach 20.3
[NASA-TM-86435] p 152 N86-15245

**LOOPS**

Digital servocontroller system. Volume 2. Maintenance manual
[AD-A159066] p 179 N86-15322

**LOW REYNOLDS NUMBER**

Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings p 136 A86-16301

Airfoil design for Reynolds numbers between 50,000 and 500,000 p 136 A86-16302

Low Reynolds number airfoil design p 136 A86-16303

Airfoil design at low Reynolds number with constrained pitching moment p 136 A86-16304

A viscous-inviscid coupling method for the design of low Reynolds number airfoil sections p 136 A86-16305

Effect of pressure gradients on the growth of subharmonic disturbances in boundary layers p 136 A86-16306

Research on laminar separation bubbles at Delft University of Technology in relation to low Reynolds number airfoil aerodynamics p 137 A86-16308

An analysis of a separation bubble transition criterion at low Reynolds numbers p 137 A86-16309

Theoretical and experimental study of low Reynolds number transitional separation bubbles p 137 A86-16310

Aspect ratio effects on the aerodynamics of a Wortmann airfoil at low Reynolds number p 137 A86-16313

Performance of finite wings at low Reynolds numbers p 138 A86-16314

An environmental aerodynamic test system for low-Reynolds-number applications p 138 A86-16315

Preliminary experiments in unsteady flow on airfoils at low Reynolds numbers p 138 A86-16320

The effect of trip wire roughness on the performance of the Wortmann FX 63-137 airfoil at low Reynolds numbers p 139 A86-16322

Acoustic and turbulence influence on low-Reynolds number wing pressure distributions p 139 A86-16323

Propeller slipstream/wing boundary layer effects at low Reynolds numbers p 139 A86-16324

**LOW TEMPERATURE ENVIRONMENTS**

Cold regions logistic supportability testing of electronic, avionic and communications equipment
[AD-A158887] p 188 N86-14514

**LUGS**

Experimental characterization of cracks at straight attachment lugs p 166 A86-16821

**LUMINESCENCE**

A method for measuring pressure distribution by means of indicating coatings p 140 A86-16687

## M

**MACH NUMBER**

Hypersonic characteristics of an advanced aerospace plane at Mach 20.3
[NASA-TM-86435] p 152 N86-15245

Fundamental study of flow field generated by rotorcraft blades using wide-field shadowgraph
[NASA-CR-176443] p 152 N86-15249

F-111 natural laminar flow glove flight test data analysis and boundary layer stability analysis
[NASA-CR-166051] p 168 N86-15305

**MAGNETIC COILS**

Magnetic suspension and balance system advanced study
[NASA-CR-3937] p 180 N86-14278

**MAGNETIC COOLING**

Magnetic suspension and balance system advanced study
[NASA-CR-3937] p 180 N86-14278

**MAGNETIC RECORDING**

Evaluation of tape recordings from an airborne digital recorder p 170 A86-16858

Processing of airborne tape recordings with the aid of user programs for monitoring the technical condition of aircraft p 133 A86-16860

Using diagnostic systems to collect data on the reliability of aircraft p 133 A86-16861

**MAGNETIC SUSPENSION**

Magnetic suspension and balance system advanced study
[NASA-CR-3937] p 180 N86-14278

**MAINTAINABILITY**

Maintainable demonstration for Army helicopters p 134 A86-18413

R&M test data management during helicopter system development p 164 A86-18419

**MAN MACHINE SYSTEMS**

Analytical methods for LHX mission and task analysis p 157 A86-18452

The interactive generation of alphanumerics and symbology with designs on the future
[AD-A159218] p 192 N86-14982

**MANEUVERS**

Development of a flight test maneuver autopilot for an F-15 aircraft
[NASA-TM-86799] p 176 N86-14275

**MATHEMATICAL MODELS**

Response of a rotorcraft model with damping non-linearities p 162 A86-17698

A model for closing the inviscid form of the average-passage equation system
[NASA-TM-87199] p 147 N86-14224

Test cases for inviscid flow field methods
[AGARD-AR-211] p 153 N86-15256

Ground resonance analysis using a substructure modeling approach p 176 N86-15282

Numerical simulation of viscous supersonic flow over a generic fighter configuration
[NASA-TM-86823] p 190 N86-15627

**MEASURING INSTRUMENTS**

Information-measurement complexes of flight vehicles --- Russian textbook p 172 A86-18743

Determination of corrections to flow direction sensor measurements over an angle-of-attack range from 0 degree to 85 degrees
[NASA-TM-86402] p 167 N86-14267

**MECHANICAL DRIVES**

Helicopter drive system bench testing p 187 A86-18410

**MECHANICAL PROPERTIES**

Role of dispersed oxides in reducing substrate/coating interdiffusion p 183 A86-17499

**MESOSCALE PHENOMENA**
Downburst: Microburst and macroburst [PB85-148880] p 191 N86-14826

**METAL FATIGUE**
Another look at generalized S-N curve shapes p 187 A86-18436

**MICROCOMPUTERS**
Digital servocontroller system. Volume 2. Maintenance manual [AD-A159066] p 179 N86-15322

**MICROELECTRONICS**
West Europe report: Science and technology [JPRS-WST-85-024] p 189 N86-15447

**MICROWAVE LANDING SYSTEMS**
The Microwave Landing System (MLS) p 160 A86-18723
A fault tolerant system for an integrated avionics sensor configuration [NASA-CR-3834] p 160 N86-15278

**MILITARY AIRCRAFT**
Stealth p 134 A86-17434
Avionics update 1986 p 170 A86-17524
The US Army aviation flight activity - An overview p 134 A86-18425

**MILITARY HELICOPTERS**
For agile read active --- control of military helicopters p 175 A86-17175
Helicopter wire strike protection system qualification testing p 163 A86-18411
Maintainable demonstration for Army helicopters p 134 A86-18413
Observations on helicopter integrated system testing based on F/A-18 experiences p 134 A86-18417
The role of simulation for the LHX p 164 A86-18421
Simulating the total system, warts and all --- automatic target acquisition for LHX helicopter p 164 A86-18422
Testing helicopters for the air-to-air combat role p 164 A86-18424
U.S. Army/Sikorsky ACAP airframe test techniques/methodology p 165 A86-18427
US Army Flight Condition Monitoring p 170 A86-18435
Use of a Service Life Assessment Program (SLAP) for identifying Service Life Extension Program (SLEP) procedures for fatigue sensitive airframe components p 134 A86-18442
SH-2F airframe fatigue test plan p 165 A86-18444
The application of fatigue damage tolerance concepts to helicopters - The approach proposed by the UK military airworthiness authorities p 165 A86-18447
Analytical methods for LHX mission and task analysis p 157 A86-18452
Tomorrow's cockpit technology in today's modern helicopter p 166 A86-18457
Use of a stored topographic data base in the modern military helicopter p 171 A86-18459
HMD: Global HUD solution p 171 A86-18460
System partitioning to provide for automatic mission and vehicle management p 175 A86-18465
Injury pattern analysis of helicopter wire strike accidents (+Gz load) p 158 A86-18843

**MILITARY OPERATIONS**
The F/A-18 Fighter/Attack aircraft program [AD-A159292] p 195 N86-15205
Light helicopter family trade-off analysis. Volume 8: Appendices S and T [AD-A158077] p 169 N86-15308

**MILITARY TECHNOLOGY**
Modernizing tactical C3I p 159 A86-18551

**MISSION PLANNING**
The F/A-18 Fighter/Attack aircraft program [AD-A159292] p 195 N86-15205
Aircraft flight performance methods. Revision 2 [AD-A158227] p 169 N86-15310

**MODAL RESPONSE**
A general purpose, multi-stage, component modal synthesis method p 186 A86-18124

**MODELS**
Prediction of wing aeroelastic effects on aircraft lift and pitching moment characteristics [NASA-TM-87631] p 178 N86-15319

**MODULATION**
Ferromagnetic resonance probe liftoff suppression apparatus [AD-D011913] p 190 N86-15647

**MOISTURE CONTENT**
Results of icing flights in winter 1983/84: Ice accretion thickness in correlation with cloud physical parameters, object and cloud parameters [DFVLR-FB-85-39] p 191 N86-15838

**MONTE CARLO METHOD**
Investigations of the aircraft landing process using a computerized simulation model based on the Monte Carlo method [DFVLR-FB-85-27] p 167 N86-14269

**MULTIENGINE VEHICLES**
Aircraft accident report: Vieques Air Link, Inc., Britten-Norman BN-21-6 Islander, N589SA, Vieques, Puerto Rico, August 2, 1984 [PB85-901408] p 159 N86-15276

**N**

**NAP-OF-THE-EARTH NAVIGATION**
Use of a stored topographic data base in the modern military helicopter p 171 A86-18459

**NASTRAN**
A general purpose, multi-stage, component modal synthesis method p 186 A86-18124

**NAVIER-STOKES EQUATION**
A comparative study of the parabolized Navier-Stokes code using various grid-generation techniques p 143 A86-17654
Some recent developments in numerical methods for transonic flows p 144 A86-17889
A fourth-order scheme for the unsteady compressible Navier-Stokes equations [NASA-CR-177994] p 147 N86-14221
The state of development research in numerical aerodynamics in West Germany --- conference [DGLR-84-01] p 147 N86-14225
Summary report on the working group for conference 1: Solutions of the Navier-Stokes equations p 147 N86-14226
An implicit finite-difference procedure for the numerical solution of unsteady supersonic flow over a blunt body p 148 N86-14229
Solutions of the Navier-Stokes equations for vortical flow p 148 N86-14231
Numerical calculation of leading-edge vortices on a flat delta wing p 148 N86-14232
Calculation of axisymmetric laminar supersonic flows over blunt bodies p 148 N86-14234
Solutions of the Navier-Stokes equations with the finite volume method p 148 N86-14235
A Navier-Stokes procedure for simulation of two-dimensional and quasi two-dimensional grid flows p 149 N86-14236
Procedure for solution of the Navier-Stokes equations at Dornier GmbH p 149 N86-14238
Calculation of separated laminar supersonic flows over blunt bodies of revolution at zero angle of attack [DFVLR-FB-85-30] p 151 N86-14256
Relative advantages of thin-layer Navier-Stokes and interactive boundary-layer procedures [NASA-TM-86778] p 152 N86-15244

**NAVIGATION AIDS**
Interference with aeronautical aids to navigation (frequencies of 108-118 MHz) by high power FM radio broadcasts (88-108 MHz) p 160 A86-18696
Avionics system for future civil helicopters [BMFT-FB-W-85-005] p 160 N86-14266
A fault tolerant system for an integrated avionics sensor configuration [NASA-CR-3834] p 160 N86-15278

**NAVIGATION INSTRUMENTS**
A structured approach for integration and test of avionics systems p 170 A86-18423
The disturbance of aircraft navigation and communication systems by atmospheric static electricity p 160 A86-13695

**NEAR WAKES**
L.D.A. measurements in the turbulent near-wake of blunt bodies p 139 A86-16371
Experimental analysis of tip vortex by laser Doppler anemometry p 140 A86-16387
Vortices and pressure waves at trailing edges [ISL-CO-224/84] p 153 N86-15252
Recent developments in three-dimensional wake analysis p 156 N86-15273

**NICKEL ALLOYS**
Thermal barrier coatings for jet engine improvement p 183 A86-16278

**NIGHT FLIGHTS (AIRCRAFT)**
HMD: Global HUD solution p 171 A86-18460

**NIGHT VISION**
HMD: Global HUD solution p 171 A86-18460
Hughes helicopters AH-64A electroluminescent lighting p 171 A86-18463

**NOISE GENERATORS**
A linearized theory for swirling supersonic jets and its application to shock-cell noise p 186 A86-17137
Noise generated by a stretching vortex p 193 A86-18689

**NOISE MEASUREMENT**
Tone excited jets. IV - Acoustic measurements p 193 A86-16469
Evaluation of a correction for sound propagation through free-jet shear layers p 193 A86-17783
Acoustic recognition of aircraft types in flight p 193 A86-18121

**NOISE PREDICTION (AIRCRAFT)**
Helicopter linear noise p 193 A86-17776
01General aviation interior noise problem: Some suggested solutions p 194 N86-15053

**NOISE REDUCTION**
01General aviation interior noise problem: Some suggested solutions p 194 N86-15053
On second propagation in radial fan casings [DFVLR-FB-85-32] p 194 N86-16053

**NOISE SPECTRA**
Discrete tones generated by an impinging underexpanded rectangular jet p 193 A86-17138

**NONDESTRUCTIVE TESTS**
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements [AD-A158004] p 181 N86-15324
Ferromagnetic resonance probe liftoff suppression apparatus [AD-D011913] p 190 N86-15647

**NONEQUILIBRIUM FLOW**
Separated transonic airfoil flow calculations with a nonequilibrium turbulence model [NASA-TM-86830] p 152 N86-15247

**NONLINEAR SYSTEMS**
On the numerical solution of nonlinear problems in fluid dynamics by least squares and finite element methods. II Applications to transonic flow simulations p 144 A86-17886
An introduction to the theory of nonlinear vibrations of aircraft structures --- Russian book p 187 A86-18739
Nonlinear dynamics of a helicopter model in ground resonance p 177 N86-15284

**NONLINEARITY**
Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha x beta vane [NAL-TR-852] p 172 N86-14270

**NONUNIFORM FLOW**
Studies on the interference of wings and propeller slipstreams p 151 N86-15241

**NORMAL SHOCK WAVES**
Turbulent-boundary-layer development in an adverse pressure gradient after an interaction with a normal shock wave p 141 A86-17031

**NORTH ATLANTIC TREATY ORGANIZATION (NATO)**
Modernizing tactical C3I p 159 A86-18551

**NOZZLE DESIGN**
Velocity and temperature decay characteristics of inverted-profile jets [NASA-TM-87159] p 147 N86-14223

**NOZZLE FLOW**
Discrete tones generated by an impinging underexpanded rectangular jet p 193 A86-17138

**NOZZLE THRUST COEFFICIENTS**
An analysis of cross-coupling of a multicomponent jet engine test stand using finite element modeling techniques [NASA-CR-176424] p 181 N86-15323

**NUMERICAL ANALYSIS**
Grid generation for single airfoil using conformal mapping [NAL-TR-8511] p 146 N86-14217
Development and application of a time-history analysis for rotorcraft dynamics based on a component approach p 168 N86-15291

**NUMERICAL CONTROL**
A computerized automatic control system for structural testing p 192 A86-18438

**NUMERICAL FLOW VISUALIZATION**
Computational fluid dynamics at NASA Ames and the numerical aerodynamic simulation program [NASA-TM-86769] p 190 N86-15626

**O**

**OBLIQUE SHOCK WAVES**
Calculation of three-dimensional shock/turbulent boundary-layer interaction generated by sharp fin p 142 A86-17135

**OGIVES**
The experimental determination of the subsonic aerodynamic characteristics of an Ogive-Cylinder body including a comparison with theoretical estimates, volume 1 [CAR-8509] p 151 N86-15242

**OH-58 HELICOPTER**
Display formats and information transfer requirements as they relate to mission, aircrew and aircraft type p 171 A86-18464

**ONBOARD DATA PROCESSING**
Flight Data Analysis and Storage System (FASS) p 170 A86-18407

**ONBOARD EQUIPMENT**
A study of the operating condition of aircraft from the recordings of the onboard recording equipment p 133 A86-16859
Using diagnostic systems to collect data on the reliability of aircraft p 133 A86-16861

**OPERATING COSTS**
Fuel saving by optimal integration of on-board avionics and air traffic control [NLR-MP-84035-U] p 159 N86-14263

**OPERATORS (PERSONNEL)**
The employment of operative aircraft dispatchers p 134 A86-18721

**OPTICAL MEASURING INSTRUMENTS**
Development of optical diaphragm deflection sensors [NASA-CR-175008] p 194 N86-15113

**OPTIMAL CONTROL**
Methodologies for the direct digital control of highly flexible vehicles [AD-A158448] p 188 N86-14615
PIFCGT: A PIF autopilot design program for general aviation aircraft [NASA-CR-166123] p 178 N86-15320

**OPTIMIZATION**
Procedure for solution of the full potential equation at Dornier GmbH p 150 N86-14249

**ORGANIC COMPOUNDS**
Variability of major organic components in aircraft fuels [AD-A159057] p 185 N86-15415

**ORGANIC MATERIALS**
A method for measuring pressure distribution by means of indicating coatings p 140 A86-16687

**ORGANIZATIONS**
DFVLR, Annual Report 1984 p 135 A86-19284

**ORIFICES**
Programming a multiple-orifice hydraulic decelerator [AD-A159428] p 181 N86-15328

**OSCILLATING FLOW**
Nonplaner, subsonic, three-dimensional oscillatory piecewise continuous kernel function method p 162 A86-17779

**OV-1 AIRCRAFT**
Display formats and information transfer requirements as they relate to mission, aircrew and aircraft type p 171 A86-18464

**OVERPRESSURE**
Development of optical diaphragm deflection sensors [NASA-CR-175008] p 194 N86-15113

**OXIDES**
Role of dispersed oxides in reducing substrate/coating interdiffusion p 183 A86-17499

**OXYGEN SUPPLY EQUIPMENT**
The oxygen equipment of passenger aircraft --- Russian book p 166 A86-18740

## P

**PANEL METHOD (FLUID DYNAMICS)**
A theoretical basis for extending surface-paneling methods to transonic flow p 142 A86-17131
Review of research in numerical aerodynamics at the DFVLR in Brunswick p 150 N86-14248

**PANELS**
Failure mechanisms of laminates transversely loaded by bolt push-through [NASA-TM-87603] p 184 N86-14314
01General aviation interior noise problem: Some suggested solutions p 194 N86-15053

**PARABOLAS**
A rapid method for estimating equivalent parabolic polars from wind-tunnel tests [AD-A159559] p 153 N86-15251

**PARACHUTE FABRICS**
Alternate altitude testing of solid cloth parachute systems [AD-A157068] p 150 N86-14251

**PARACHUTES**
Alternate altitude testing of solid cloth parachute systems [AD-A157068] p 150 N86-14251

**PARTIAL DIFFERENTIAL EQUATIONS**
Shock design for refined recalculations p 150 N86-14247

**PARTICLE SIZE DISTRIBUTION**
Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel p 184 N86-15346

**PASSENGER AIRCRAFT**
The oxygen equipment of passenger aircraft --- Russian book p 166 A86-18740

**PASSENGERS**
Effectiveness of the civil aviation security program [AD-A159511] p 158 N86-14260

**PAVEMENTS**
Furfuryl alcohol polymer concretes for use in all-weather repairs of concrete and asphalt surfaces [DE85-014825] p 184 N86-14391
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements [AD-A158004] p 181 N86-15324

**PERFORATED SHELLS**
Drag reduction of perforated axisymmetric bodies in supersonic flow p 144 A86-18047

**PERFORMANCE PREDICTION**
Aircraft flight performance methods. Revision 2 [AD-A158227] p 169 N86-15310

**PERFORMANCE TESTS**
The effect of trip wire roughness on the performance of the Wortmann FX 63-137 airfoil at low Reynolds numbers p 139 A86-16322
Testing time for AMX - The close support specialist moves towards production p 162 A86-17435
National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings p 163 A86-18401
Development testing of the H-60 composite main rotor blade p 163 A86-18404
FAA certification of rotorcraft engine induction system for ice protection p 157 A86-18406
Helicopter drive system bench testing p 187 A86-18410
Operational testing experience on the AH-64A Apache p 164 A86-18418
Reliability development testing of SH-60B helicopter mechanical systems p 164 A86-18420
Testing helicopters for the air-to-air combat role p 164 A86-18424
Testing large transmissions p 187 A86-18426

**PERMEABILITY**
Critical permeability parameter in supersonic gradient flow p 146 A86-19148

**PHYSICAL CHEMISTRY**
Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel p 184 N86-15346

**PILOT PERFORMANCE**
The possibility of using a flight recorder for the analysis of pilot performance p 170 A86-16862
Pilot medical certification - Procedures and recent developments p 195 A86-18849

**PILOT TRAINING**
Wide-angle, low-altitude flight simulator vision system for cockpit research and aircrew training p 180 A86-18453
Advanced simulator for pilot training: Effects of collimation on accommodation and vergence [AD-A159545] p 181 N86-14279

**PIPE FLOW**
A model for closing the inviscid form of the average-passage equation system [NASA-TM-87199] p 147 N86-14224

**PISTONS**
Programming a multiple-orifice hydraulic decelerator [AD-A159428] p 181 N86-15328

**PITCH**
Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover p 177 N86-15286

**PITCH (INCLINATION)**
A review of dynamic inflow and its effect on experimental correlations p 157 N86-15293

**PITCHING MOMENTS**
Static and dynamic pitch stability of a blunted cone with forward facing aerodynamic spike in hypersonic flow p 135 A86-16249
Airfoil design at low Reynolds number with constrained pitching moment p 136 A86-16304
Prediction of wing aeroelastic effects on aircraft lift and pitching moment characteristics [NASA-TM-87631] p 178 N86-15319

**PLASMA SPRAYING**
Thermal barrier coatings for jet engine improvement p 183 A86-16276

**PLASTIC AIRCRAFT STRUCTURES**
Interleaf technology for carbon composite aircraft primary structure p 182 A86-16208

**PLATES (STRUCTURAL MEMBERS)**
Stress concentration around a small circular hole in the HiMAT composite plate [NASA-TM-86038] p 184 N86-15350

**PLENUM CHAMBERS**
Investigations of transonic Ludwieg tubes. III - Effects of plenum exhaust system on starting process of tunnel test section p 140 A86-16836

**PNEUMATIC CONTROL**
Dynamic response characteristics of a circulation control rotor model pneumatic system p 157 N86-15298

**PNEUMATIC EQUIPMENT**
Flight tests of the helicopter pneumatic deicing system p 163 A86-18408

**POLYMERIZATION**
Antimisting kerosene: Development of a continuous 10 GPM in-line blender [NASA-CR-176432] p 185 N86-15412

**POLYMERS**
Furfuryl alcohol polymer concretes for use in all-weather repairs of concrete and asphalt surfaces [DE85-014825] p 184 N86-14391

**POROUS BOUNDARY LAYER CONTROL**
Critical permeability parameter in supersonic gradient flow p 146 A86-19148

**PORTS (OPENINGS)**
Resonant cavities for stall recovery in gas turbine engines [AD-D011891] p 175 N86-15317

**POSITIONING DEVICES (MACHINERY)**
Adapter pallet system [AD-D011858] p 191 N86-15671

**POSTFLIGHT ANALYSIS**
A study of the operating condition of aircraft from the recordings of the onboard recording equipment p 133 A86-16859
Processing of airborne tape recordings with the aid of user programs for monitoring the technical condition of aircraft p 133 A86-16860

**POTENTIAL FLOW**
Vortex-fitted potential and vortex-captured Euler solution for leading-edge vortex flow p 142 A86-17149
Delta wings with shock-free cross flow p 145 A86-18528
Numerical solutions for three-dimensional cases: Delta wings p 155 N86-15264

**POTENTIAL THEORY**
The state of development research in numerical aerodynamics in West Germany --- conference [DGLR-84-01] p 147 N86-14225
Comparison of the Euler and potential solutions for supersonic flows over delta wings p 149 N86-14239
A procedure for solution of full potential equations with correction of the trailing edge condition p 150 N86-14246
Shock design for refined recalculations p 150 N86-14247
Review of research in numerical aerodynamics at the DFVLR in Brunswick p 150 N86-14248
Procedure for solution of the full potential equation at Dornier GmbH p 150 N86-14249
A consistent spatial differencing scheme for the transonic full-potential equation in three dimensions [NASA-TM-86716] p 152 N86-15246

**PREDICTION ANALYSIS TECHNIQUES**
Semiempirical method for predicting vortex-induced rolling moments [NASA-TM-87579] p 147 N86-14222
The effect of supply parameters on the volume of future aircraft movements p 158 N86-14258
Computer program for performance prediction of tandem-rotor helicopters [AD-A159193] p 167 N86-14268

**PREDICTIONS**
Aircraft Drag Prediction and Reduction [AGARD-R-723] p 155 N86-15266
Parasitic and interference drag prediction and reduction p 156 N86-15272
Prediction of the drag of wings at subsonic speeds by viscous/inviscid interaction techniques p 156 N86-15274
Prediction of wing aeroelastic effects on aircraft lift and pitching moment characteristics [NASA-TM-87631] p 178 N86-15319

**PREMIXING**
Investigation of chemically-reacting supersonic internal flows [NASA-CR-176363] p 188 N86-14532

**PRESSURE DISTRIBUTION**
A method for measuring pressure distribution by means of indicating coatings p 140 A86-16687
An airfoil flutter model suspension system to accommodate large static transonic airloads [NASA-CR-177986] p 146 N86-14220
Simulation of three-dimensional viscous transonic flows p 148 N86-14233
A procedure for solution of full potential equations with correction of the trailing edge condition p 150 N86-14246
Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data [NASA-TM-86816] p 188 N86-14555
Relative advantages of thin-layer Navier-Stokes and interactive boundary-layer procedures [NASA-TM-86778] p 152 N86-15244
Numerical solutions of two-dimensional reference test cases p 154 N86-15262

**PRESSURE GRADIENTS**
Effect of pressure gradients on the growth of subharmonic disturbances in boundary layers p 136 A86-16306
Turbulent-boundary-layer development in an adverse pressure gradient after an interaction with a normal shock wave p 141 A86-17031
Mean-flow measurements in a supersonic three-dimensional turbulent boundary layer p 141 A86-17050

**PRESSURE MEASUREMENT**
A method for measuring pressure distribution by means of indicating coatings p 140 A86-16687
Development of optical diaphragm deflection sensors [NASA-CR-175008] p 194 N86-15113

**PRESSURE OSCILLATIONS**
Vortices incident upon a leading edge - Instantaneous pressure fields p 141 A86-17060

**PRESSURE SENSORS**
Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha x beta vane [NAL-TR-852] p 172 N86-14270
Development of optical diaphragm deflection sensors [NASA-CR-175008] p 194 N86-15113

**PRODUCTION ENGINEERING**
The F/A-18 Fighter/Attack aircraft program [AD-A159292] p 195 N86-15205

**PROFILE METHOD (FORECASTING)**
Procedure for solution of the Euler equations at Dornier GmbH p 149 N86-14242

**PROJECT PLANNING**
An aircraft maintenance and repair strategy using a test and diagnostic system p 133 A86-16855

**PROJECTILES**
An analytical modularized treatment of autopilots for guided projectile simulations [AD-A159311] p 182 N86-14282

**PROP-FAN TECHNOLOGY**
Propulsion system integration configurations for future prop-fan powered aircraft p 173 A86-17777
West Europe report: Science and technology [JPRS-WST-85-024] p 189 N86-15447
French program CHARME develops propfan aircraft p 169 N86-15450

**PROPELLANT ADDITIVES**
The temperature dependence of the electrical conductivity of jet fuels with antistatic additives p 183 A86-16750

**PROPELLER FANS**
Propulsion system integration configurations for future prop-fan powered aircraft p 173 A86-17777

**PROPELLER SLIPSTREAMS**
Propeller slipstream/wing boundary layer effects at low Reynolds numbers p 139 A86-16324
Studies on the interference of wings and propeller slipstreams p 151 N86-15241

**PROPELLERS**
AN-22 test bed for advanced propeller technology p 174 N86-14274

**PROPULSION SYSTEM CONFIGURATIONS**
Propulsion system integration configurations for future prop-fan powered aircraft p 173 A86-17777
Natural selection in transport aircraft propulsion p 174 A86-19278

**PROPULSION SYSTEM PERFORMANCE**
Small turbine technology review [AD-A158514] p 175 N86-15316

**PROTECTIVE COATINGS**
Coating requirements in gas turbine engines p 173 A86-17490
Role of dispersed oxides in reducing substrate/coating interdiffusion p 183 A86-17499

**PULTRUSION**
Pultrusion used to fabricate tail rotor spar p 133 A86-17380

## Q

**QUALIFICATIONS**
The US Army aviation flight activity - An overview p 134 A86-18425

**QUALITATIVE ANALYSIS**
Variability of major organic components in aircraft fuels [AD-A159057] p 185 N86-15415

## R

**RADAR**
Number of targets threatened simultaneously (NOTTS) in conjunction with over the horizon back-scatter (OTHB) radar coverage [AD-A159304] p 189 N86-15528

**RADAR ANTENNAS**
Basic characteristics of radar antenna with synthesized aperture tracking arbitrary motion of aircraft p 189 N86-15575

**RADAR RESOLUTION**
Basic characteristics of radar antenna with synthesized aperture tracking arbitrary motion of aircraft p 189 N86-15575

**RADAR TRACKING**
Basic characteristics of radar antenna with synthesized aperture tracking arbitrary motion of aircraft p 189 N86-15575

**RADIAL FLOW**
On second propagation in radial fan casings [DFVLR-FB-85-32] p 194 N86-16053

**RADIO FREQUENCY INTERFERENCE**
Interference with aeronautical aids to navigation (frequencies of 108-118 MHz) by high power FM radio broadcasts (88-108 MHz) p 160 A86-18696

**RADIO NAVIGATION**
Interference with aeronautical aids to navigation (frequencies of 108-118 MHz) by high power FM radio broadcasts (88-108 MHz) p 160 A86-18696

**RAIN**
Surface wetting effects on a laminar flow airfoil in simulated heavy rain p 162 A86-17780
Furfuryl alcohol polymer concretes for use in all-weather repairs of concrete and asphalt surfaces [DE85-014825] p 184 N86-14391

**RANDOM VIBRATION**
Analytical estimation of the variance of error in determining geographic-meridian direction by the gyrocompass method with random oscillation of the base p 160 A86-18990

**RAWINSONDES**
Mobile intercept of storms p 191 N86-15771

**REACTION TIME**
The interactive generation of alphanumerics and symbology with designs on the future [AD-A159218] p 192 N86-14982

**REAL TIME OPERATION**
Acoustic recognition of aircraft types in flight p 193 A86-18121
Modernizing tactical C3I p 159 A86-18551
The interactive generation of alphanumerics and symbology with designs on the future [AD-A159218] p 192 N86-14982

**RECONSTRUCTION**
An optimisation method for reconstruction of flight path trajectories from non-synchronous time-sampled observations by two cine cameras [ARL-SYS-R-34] p 167 N86-15279

**RECTANGULAR WINGS**
Performance of finite wings at low Reynolds numbers p 138 A86-16314
Behaviour of a rectangular wing in a supersonic flow - Dynamic pressure and normal force analysis in the range 1 3-4.0 Mach p 146 A86-19005

**REDUNDANCY**
Integrated Application of Active Controls (IAAC) technology to an advanced subsonic transport project: Test act system description [NASA-CR-172221] p 176 N86-14277

**REGRESSION ANALYSIS**
Optimal design application on the advanced aeroelastic rotor blade p 167 N86-15290
The relationship between material failures and flight hours: Statistical considerations [AD-A159571] p 169 N86-15311

**REGULATIONS**
How is airline deregulation working? p 194 A86-18537
Airline deregulation - What will we know and when will we know it? p 194 A86-18538

**RELIABILITY**
A new Euler algorithm based on characteristic flux extrapolation p 149 N86-14241
Light helicopter family trade-off analysis. Volume 8: Appendices S and T [AD-A158077] p 169 N86-15308

**REMOTELY PILOTED VEHICLES**
An environmental aerodynamic test system for low-Reynolds-number applications p 138 A86-16315

**RESEARCH AND DEVELOPMENT**
DFVLR, Annual Report 1984 p 135 A86-19284

**RESEARCH FACILITIES**
Programming a multiple-orifice hydraulic decelerator [AD-A159428] p 181 N86-15328

**RESEARCH MANAGEMENT**
Activities report in aerospace research p 135 N86-15240

**RESONANCE**
Influence of various unsteady aerodynamic models on the aeromechanical stability of a helicopter in ground resonance p 177 N86-15294

**RESONANCE PROBES**
Ferromagnetic resonance probe liftoff suppression apparatus [AD-D011913] p 190 N86-15647

**RESONANT FREQUENCIES**
Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover p 177 N86-15286

**RESONANT VIBRATION**
Optimal design application on the advanced aeroelastic rotor blade p 167 N86-15290

**REYNOLDS NUMBER**
Numerical approximation of the total drag of a body in a tube [AD-A159548] p 188 N86-14538
Hypersonic characteristics of an advanced aerospace plane at Mach 20.3 [NASA-TM-86435] p 152 N86-15245
F-111 natural laminar flow glove flight test data analysis and boundary layer stability analysis [NASA-CR-166051] p 166 N86-15305

**RIGID ROTORS**
Stability of large damped flexible spacecraft with stored angular momentum p 182 A86-18355
Coupled rotor-body vibrations with inplane degrees of freedom p 177 N86-15301

**ROCKET ENGINE DESIGN**
Lizzy - The first British liquid propellant rocket motor p 195 A86-18481

**ROLL**
A review of dynamic inflow and its effect on experimental correlations p 157 N86-15293

**ROLLING MOMENTS**
Semiempirical method for predicting vortex-induced rolling moments [NASA-TM-87579] p 147 N86-14222

**ROOM TEMPERATURE**
Development of optical diaphragm deflection sensors [NASA-CR-175008] p 194 N86-15113

**ROTARY WING AIRCRAFT**
Response of a rotorcraft model with damping non-linearities p 162 A86-17698
Fundamental study of flow field generated by rotorcraft blades using wide-field shadowgraph [NASA-CR-176443] p 152 N86-15249
Rotorcraft Dynamics 1984 [NASA-CP-2400] p 167 N86-15280
Ground resonance analysis using a substructure modeling approach p 176 N86-15282
Test results from a dynamic model dynaflex rotor p 167 N86-15285
Development of an unsteady aerodynamics model to improve correlation of computed blade stresses with test data p 156 N86-15288

**ROTARY WINGS**
Methods for rotor aerodynamic and dynamic analysis p 161 A86-17068
Aeroelastic model helicopter rotor testing in the Langley TDT --- Transonic Dynamics Tunnel p 163 A86-18402
Interpretation and evaluation of fatigue properties of cast, HIP and heat treated titanium UH-60A M. R. Hub p 183 A86-18434
Methods of full scale fatigue testing the Apache helicopter rotor systems p 180 A86-18439
A rig for the fatigue testing of rotor hubs p 180 A86-18440
Fundamental study of flow field generated by rotorcraft blades using wide-field shadowgraph [NASA-CR-176443] p 152 N86-15249
Lifting surface theory for a helicopter rotor in forward flight p 156 N86-15287
Optimal design application on the advanced aeroelastic rotor blade p 167 N86-15290
Restructuring the rotor analysis program C-60 p 168 N86-15292
An examination of the relations between rotor vibratory loads and airframe vibrations p 177 N86-15299
Analysis of potential helicopter vibration reduction concepts p 178 N86-15302

**ROTATING STALLS**
Resonant cavities for stall recovery in gas turbine engines [AD-D011891] p 175 N86-15317

**ROTOR AERODYNAMICS**
Methods for rotor aerodynamic and dynamic analysis p 161 A86-17068
Noise of counter-rotation propellers with nonsynchronous rotors p 193 A86-17788
Aeroelastic model helicopter rotor testing in the Langley TDT --- Transonic Dynamics Tunnel p 163 A86-18402
Stability of limit cycles in frictionally damped and aerodynamically unstable rotor stages p 174 A86-19198
Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data [NASA-TM-86816] p 188 N86-14555

Performance and loads data from a hover test of a full-scale XV-15 rotor
[NASA-TM-86833] p 152 N86-15243
Lifting surface theory for a helicopter rotor in forward flight p 156 N86-15287

**ROTOR BLADES**
Model for analytically describing edge vortices p 140 A86-16867
Transonic rotor flow-measurement technique using holographic interferometry p 141 A86-17069
Development testing of the H-60 composite main rotor blade p 163 A86-18404
Hovering model helicopter rotor testing p 179 A86-18412
Verification of static rotor-load measurement capabilities of the RSRA helicopter active-isolator system p 165 A86-18428
The use of active controls to augment rotor/fuselage stability p 176 N86-15281

**ROTOR BODY INTERACTIONS**
The use of active controls to augment rotor/fuselage stability p 176 N86-15281

**ROTOR SPEED**
Parametric study of the aeroelastic stability of a bearingless rotor p 176 N86-15283

**ROTOR SYSTEMS RESEARCH AIRCRAFT**
Verification of static rotor-load measurement capabilities of the RSRA helicopter active-isolator system p 165 A86-18428
Evaluation of a load cell model for dynamic calibration of the rotor systems research aircraft p 168 N86-15304

**ROTORCRAFT AIRCRAFT**
The wind tunnel as a design tool p 179 A86-18429

**ROTORS**
Aeroelastic considerations for torsionally soft rotors p 157 N86-15289

**RUNGE-KUTTA METHOD**
Summary report on the working group on conference 2: Solutions of the Euler equations p 148 N86-14227
Procedure for solution of the Navier-Stokes equations at Dornier GmbH p 149 N86-14238

**RUNWAY CONDITIONS**
Influence of rough runways on undercarriage design p 166 A86-19277

**RUNWAYS**
Long taxi rolls can lead to catastrophic blow-outs p 157 A86-17063
High-speed braking of an aircraft tire on grooved surfaces p 162 A86-17787
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements
[AD-A158004] p 181 N86-15324

## S

**S-N DIAGRAMS**
Another look at generalized S-N curve shapes p 187 A86-18436

**SABOTAGE**
Effectiveness of the civil aviation security program
[AD-A159511] p 158 N86-14260

**SAFETY**
NASA flight operations review
[NASA-CR-176404] p 135 N86-14215
Light helicopter family trade-off analysis. Volume 10: Appendices V, W, X, and Z
[AD-A158079] p 169 N86-15309

**SCALE MODELS**
Test results from a dynamic model dynaflex rotor p 167 N86-15285

**SCREEN EFFECT**
Self-similar supersonic gas flows through a permeable screen p 140 A86-16784

**SEALS (STOPPERS)**
Dynamic response of film thickness in spiral-groove face seals
[NASA-TP-2544] p 174 N86-15313

**SELF OSCILLATION**
Aeroelasticity and dynamics of the helicopter structure --- Russian book p 166 A86-18733

**SEPARATED FLOW**
Airfoil design for Reynolds numbers between 50,000 and 500,000 p 136 A86-16302
Low Reynolds number airfoil design p 136 A86-16303
Effect of pressure gradients on the growth of subharmonic disturbances in boundary layers p 136 A86-16306
Research on laminar separation bubbles at Delft University of Technology in relation to low Reynolds number airfoil aerodynamics p 137 A86-16308
An analysis of a separation bubble transition criterion at low Reynolds numbers p 137 A86-16309
Theoretical and experimental study of low Reynolds number transitional separation bubbles p 137 A86-16310
Separation bubble behavior for a NACA 23009 airfoil p 137 A86-16312
Symmetry breaking and lift hysteresis arising from massive laminar separation - A study of multiple steady-state solutions p 138 A86-16316
Mean flow properties measured around an aerofoil close to its maximum lift p 140 A86-16395
An experimental study of geometrical effects on the drag and flow field of two bluff bodies separated by a gap p 141 A86-17055
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17636
Modification to the NASA Langley 4- by 7-meter tunnel for improved rotorcraft aerodynamics and acoustics p 179 A86-18414
The vortex patterns of dynamic separation - A parametric and comparative study p 145 A86-18534
Large-scale separation and hysteresis in cascades p 145 A86-18577
Separated transonic airfoil flow calculations with a nonequilibrium turbulence model
[NASA-TM-86830] p 152 N86-15247
A rapid method for estimating equivalent parabolic polars from wind-tunnel tests
[AD-A159559] p 153 N86-15251

**SERVICE LIFE**
Impact of loads recording methodology on crack-growth-based individual aircraft tracking p 162 A86-17790
Use of a Service Life Assessment Program (SLAP) for identifying Service Life Extension Program (SLEP) procedures for fatigue sensitive airframe components p 134 A86-18442
Aircraft reliability, safety, and lifetime --- Russian book p 166 A86-19290

**SERVOMECHANISMS**
Digital servocontroller system. Volume 1: Operations manual
[AD-A158392] p 192 N86-14960
Digital servocontroller system. Volume 2. Maintenance manual
[AD-A159066] p 179 N86-15322

**SHADOWGRAPH PHOTOGRAPHY**
Fundamental study of flow field generated by rotorcraft blades using wide-field shadowgraph
[NASA-CR-176443] p 152 N86-15249

**SHEAR FLOW**
Noise generated by a stretching vortex p 193 A86-18689

**SHEAR LAYERS**
Evaluation of a correction for sound propagation through free-jet shear layers p 193 A86-17783

**SHIPS**
Dynamic interface - Conventional flight testing plus a new analytical approach p 163 A86-18405

**SHOCK ABSORBERS**
Influence of rough runways on undercarriage design p 166 A86-19277

**SHOCK LAYERS**
The effect of a shock layer on the viscous resistance of star-shaped bodies with flat side faces p 140 A86-16691

**SHOCK WAVE INTERACTION**
The application of laser anemometry to the study of transonic shock boundary-layer interactions p 139 A86-16352
The effect of a shock layer on the viscous resistance of star-shaped bodies with flat side faces p 140 A86-16691
Turbulent-boundary-layer development in an adverse pressure gradient after an interaction with a normal shock wave p 141 A86-17031
Structure of a supersonic turbulent boundary layer during its interaction with a shock wave p 141 A86-17096
A linearized theory for swirling supersonic jets and its application to shock-cell noise p 186 A86-17137
Shock wave/turbulent boundary layer interaction and its control p 145 A86-18535
Procedure for solution of the Navier-Stokes equations at Dornier GmbH p 149 N86-14238

**SHOCK WAVE PROPAGATION**
Formulation of the Euler boundary value problem p 154 N86-15258

**SHOCK WAVES**
A transonic wing-body flowfield calculation with improved grid topology p 142 A86-17134
Delta wings with shock-free cross flow p 145 A86-18528
A compressible laminar boundary layer on a plane triangular plate with an attached shock wave p 146 A86-18902

**SHORT TAKEOFF AIRCRAFT**
Velocity and temperature decay characteristics of inverted-profile jets
[NASA-TM-87159] p 147 N86-14223

**SIDESLIP**
Determination of corrections to flow direction sensor measurements over an angle-of-attack range from 0 degree to 85 degrees
[NASA-TM-86402] p 167 N86-14267
Hypersonic characteristics of an advanced aerospace plane at Mach 20.3
[NASA-TM-86435] p 152 N86-15245

**SIGNAL RECEPTION**
VHF-AM communications equipment selection and installation practices for helicopters
[DOT/FAA/PM-85/8] p 189 N86-15518

**SIKORSKY AIRCRAFT**
Flight Data Analysis and Storage System (FASS) p 170 A86-18407

**SILICON**
Development of optical diaphragm deflection sensors
[NASA-CR-175008] p 194 N86-15113

**SIMULATION**
The role of simulation for the LHX p 164 A86-18421
Digital servocontroller system. Volume 1: Operations manual
[AD-A158392] p 192 N86-14960
Numerical simulation of viscous supersonic flow over a generic fighter configuration
[NASA-TM-86823] p 190 N86-15627

**SLURRIES**
Antimisting kerosene: Development of a continuous 10 GPM in-line blender
[NASA-CR-176432] p 185 N86-15412

**SMOG**
Variability of major organic components in aircraft fuels
[AD-A159057] p 185 N86-15415

**SOLID-SOLID INTERFACES**
Role of dispersed oxides in reducing substrate/coating interdiffusion p 183 A86-17499

**SOOT**
Variability of major organic components in aircraft fuels
[AD-A159057] p 185 N86-15415
Fuel effects on soot formation in turbojet engines
[AD-A159073] p 185 N86-15416

**SOUND PROPAGATION**
On second propagation in radial fan casings
[DFVLR-FB-85-32] p 194 N86-16053

**SOUNDING ROCKETS**
Behaviour of a rectangular wing in a supersonic flow - Dynamic pressure and normal force analysis in the range 1.3-4.0 Mach p 146 A86-19005

**SPACECRAFT STABILITY**
Stability of large damped flexible spacecraft with stored angular momentum p 182 A86-18355

**SPATIAL DISTRIBUTION**
A consistent spatial differencing scheme for the transonic full-potential equation in three dimensions
[NASA-TM-86716] p 152 N86-15246

**SPATIAL MARCHING**
Comparison of the Euler and potential solutions for supersonic flows over delta wings p 149 N86-14239
Application of a dynamic grid adaptation in the ASWR procedure p 149 N86-14243

**SPEED INDICATORS**
Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha times beta vane
[NAL-TR-852] p 172 N86-15312

**SPIKES (AERODYNAMIC CONFIGURATIONS)**
Static and dynamic pitch stability of a blunted cone with forward facing aerodynamic spike in hypersonic flow p 135 A86-16249

**SPILLING**
Variability of major organic components in aircraft fuels
[AD-A159057] p 185 N86-15415

**SPIN STABILIZATION**
A study of aircraft motion stability in steady spin p 176 A86-19070

**SPLINES**
Torsional low cycle fatigue of spline-ended drive components p 187 A86-18431

**SPRAYED COATINGS**
Flame rig testing of thermal barrier coatings and correlation with engine results p 173 A86-17491

**STABILITY**
Dynamic stability of a bearingless circulation control rotor blade in hover p 177 N86-15297

**STABLE OSCILLATIONS**
Stability of limit cycles in frictionally damped and aerodynamically unstable rotor stages p 174 A86-19198

**STARTING**

Investigations of transonic Ludwieg tubes. III - Effects of plenum exhaust system on starting process of tunnel test section p 140 A86-16838

**STATIC ELECTRICITY**

The disturbance of aircraft navigation and communication systems by atmospheric static electricity p 160 A86-18695

**STATIC LOADS**

Hypersonic characteristics of an advanced aerospace plane at Mach 20.3 [NASA-TM-86435] p 152 N86-15245

**STATIC PRESSURE**

An airfoil flutter model suspension system to accommodate large static transonic airloads [NASA-CR-177998] p 146 N86-14220

**STATIC TESTS**

U.S. Army/Sikorsky ACAP airframe test techniques/methodology p 165 A86-18427

Verification of static rotor-load measurement capabilities of the RSRA helicopter active-isolator system p 165 A86-18428

**STATISTICAL ANALYSIS**

Investigations of the aircraft landing process using a computerized simulation model based on the Monte Carlo method [DFVLR-FB-85-27] p 167 N86-14269

**STATISTICS**

Results of the expert study of accidents during operation of German aircraft in the homeland and abroad as well as of foreign aircraft in the homeland p 158 N86-14261

Results of the expert study of accidents during operation of German aircraft in the homeland and abroad as well as of foreign aircraft in the homeland p 159 N86-14262

**STEADY FLOW**

Self-similar supersonic gas flows through a permeable screen p 140 A86-16784

Application of NLR's calculation methods to transonic flow about oscillating wings p 143 A86-17778

Some recent developments in numerical methods for transonic flows p 144 A86-17889

Objectives and scope of the Working Group 07 p 153 N86-15257

**STEADY STATE**

Formulation of the Euler boundary value problem p 154 N86-15258

**STIFFENING**

Failure mechanisms of laminates transversely loaded by bolt push-through [NASA-TM-87603] p 184 N86-14314

**STIFFNESS**

Investigation of chemically-reacting supersonic internal flows [NASA-CR-176363] p 188 N86-14532

**STORMS (METEOROLOGY)**

Downburst: Microburst and macroburst [PB85-148880] p 191 N86-14826

**STRAKES**

Use of hinged strakes for lateral control at high angles of attack [AD-A158005] p 178 N86-15321

**STREAM FUNCTIONS (FLUIDS)**

A consistent spatial differencing scheme for the transonic full-potential equation in three dimensions [NASA-TM-86716] p 152 N86-15246

**STREAMS**

Multiple ducted streams with a periodic or a steady supersonic driver flow p 142 A86-17129

**STRESS CONCENTRATION**

Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements [AD-A158004] p 181 N86-15324

Stress concentration around a small circular hole in the HiMAT composite plate [NASA-TM-86038] p 184 N86-15350

**STRESS INTENSITY FACTORS**

Experimental characterization of cracks at straight attachment lugs p 186 A86-16821

**STRETCHING**

Quasi nonstretching hypervelocity jets [ISL-CO-236/84] p 153 N86-15254

**STRUCTURAL ANALYSIS**

A methodology for analyzing laser-induced structural damage p 186 A86-17791

Planning, creating and documenting a NASTRAN finite element model of a modern helicopter p 189 N86-15300

Analysis of potential helicopter vibration reduction concepts p 178 N86-15302

Flutter generator control and force computer [AEL-0242-TM] p 178 N86-15318

**STRUCTURAL VIBRATION**

Modal constraints on structural dynamic force determination p 161 A86-17070

Stability of large damped flexible spacecraft with stored angular momentum p 162 A86-18355

An introduction to the theory of nonlinear vibrations of aircraft structures --- Russian book p 187 A86-18739

**SUBCRITICAL FLOW**

Trailing edge flow with transonic profiles p 149 N86-14240

**SUBSONIC AIRCRAFT**

Influence of the dropping conditions on container motion near the carrier and on the impact parameters p 158 A86-19069

**SUBSONIC FLOW**

Supercritical mode of the nonlinear interaction of subsonic and supersonic inviscid jets in a two-dimensional channel p 142 A86-17098

Solution of the Euler equations - Explicit schemes acceleration by a multigrid method [ONERA, TP NO. 1985-129] p 142 A86-17627

Nonplanar, subsonic, three-dimensional oscillatory piecewise continuous kernel function method p 162 A86-17779

Flow past caret wings with flaps p 146 A86-18903

Determination of the intensity of a free vortex sheet in the context of airfoil theory p 146 A86-18904

**SUBSONIC SPEED**

Integrated Application of Active Controls (IAAC) technology to an advanced subsonic transport project: Test act system description [NASA-CR-172221] p 176 N86-14277

The experimental determination of the subsonic aerodynamic characteristics of an Ogive-Cylinder body including a comparison with theoretical estimates, volume 1 [CAR-8509] p 151 N86-15242

**SUBSTRATES**

Role of dispersed oxides in reducing substrate/coating interdiffusion p 183 A86-17499

**SUBSTRUCTURES**

A general purpose, multi-stage, component modal synthesis method p 186 A86-18124

**SUCTION**

Laminar flow control with suction: Theory and experiment p 155 N86-15269

**SUPERCOMPUTERS**

Computational fluid dynamics at NASA Ames and the numerical aerodynamic simulation program [NASA-TM-86769] p 190 N86-15626

**SUPERCONDUCTING MAGNETS**

Magnetic suspension and balance system advanced study [NASA-CR-3937] p 180 N86-14278

**SUPERCRITICAL AIRFOILS**

The application of laser anemometry to the study of transonic shock boundary-layer interactions p 139 A86-16352

An airfoil flutter model suspension system to accommodate large static transonic airloads [NASA-CR-177998] p 146 N86-14220

Separated transonic airfoil flow calculations with a nonequilibrium turbulence model [NASA-TM-86830] p 152 N86-15247

**SUPERCRITICAL FLOW**

A theoretical basis for extending surface-paneling methods to transonic flow p 142 A86-17131

Trailing edge flow with transonic profiles p 149 N86-14240

**SUPERSONIC AIRCRAFT**

Investigation of a supersonic cruise fighter model flow field [NASA-TM-86361] p 152 N86-15248

**SUPERSONIC AIRFOILS**

Delta wings with shock-free cross flow p 145 A86-18528

**SUPERSONIC BOUNDARY LAYERS**

The effect of a shock layer on the viscous resistance of star-shaped bodies with flat side faces p 140 A86-16691

Mean-flow measurements in a supersonic three-dimensional turbulent boundary layer p 141 A86-17059

Structure of a supersonic turbulent boundary layer during its interaction with a shock wave p 141 A86-17096

**SUPERSONIC COMBUSTION**

Study of high speed combustion flows by laser velocimetry [NASA-CR-176439] p 190 N86-15668

**SUPERSONIC COMBUSTION RAMJET ENGINES**

Investigation of chemically-reacting supersonic internal flows [NASA-CR-176363] p 188 N86-14532

**SUPERSONIC CRUISE AIRCRAFT RESEARCH**

Theoretical and experimental flow fields for a supersonic cruise fighter forebody [NASA-TM-86450] p 146 N86-14218

Preliminary design of a supersonic cruise aircraft high-pressure turbine [NASA-CR-174878] p 174 N86-14272

**SUPERSONIC FLIGHT**

Damping of the rolling motion of full caliber fin-stabilized projectiles in supersonic flight [ISL-CO-233/84] p 153 N86-15253

**SUPERSONIC FLOW**

Self-similar supersonic gas flows through a permeable screen p 140 A86-16784

Multiple ducted streams with a periodic or a steady supersonic driver flow p 142 A86-17129

Solution of the Euler equations - Explicit schemes acceleration by a multigrid method [ONERA, TP NO. 1985-129] p 142 A86-17627

Supersonic viscous-inviscid interaction of a swept compression ramp with a turbulent boundary layer [AIAA PAPER 85-1669] p 143 A86-17826

Drag reduction of perforated axisymmetric bodies in supersonic flow p 144 A86-18047

Shock wave/turbulent boundary layer interaction and its control p 145 A86-18535

Flow past caret wings with flaps p 146 A86-18903

Behaviour of a rectangular wing in a supersonic flow - Dynamic pressure and normal force analysis in the range 1.3-4.0 Mach p 146 A86-19005

Critical permeability parameter in supersonic gradient flow p 146 A86-19148

Theoretical and experimental flow fields for a supersonic cruise fighter forebody [NASA-TM-86450] p 146 N86-14218

Summary report on the working group on conference 2: Solutions of the Euler equations p 148 N86-14227

Comparison of the Euler and potential solutions for supersonic flows over delta wings p 149 N86-14239

Shock design for refined recalculations p 150 N86-14247

Investigation of chemically-reacting supersonic internal flows [NASA-CR-176363] p 188 N86-14532

Objectives and scope of the Working Group 07 p 153 N86-15257

Exact solutions to transonic and supersonic flows p 154 N86-15260

Numerical simulation of viscous supersonic flow over a generic fighter configuration [NASA-TM-86823] p 190 N86-15627

**SUPERSONIC FLUTTER**

On the teaching of the principles of wing flexure-torsion flutter p 185 A86-16248

**SUPERSONIC JET FLOW**

Supercritical mode of the nonlinear interaction of subsonic and supersonic inviscid jets in a two-dimensional channel p 142 A86-17098

A linearized theory for swirling supersonic jets and its application to shock-cell noise p 186 A86-17137

Discrete tones generated by an impinging underexpanded rectangular jet p 193 A86-17138

**SUPPORT SYSTEMS**

Navy aircraft support data systems study: ECAMS/NALCOMIS integration feasibility and procedure [DE85-016977] p 192 N86-15003

**SURFACE GEOMETRY**

The effect of the curvature of the external contours of turbine blade profiles on their aerodynamic characteristics p 144 A86-18152

**SURFACE ROUGHNESS**

Programming a multiple-orifice hydraulic decelerator [AD-A159428] p 181 N86-15328

**SURFACE ROUGHNESS EFFECTS**

The effect of trip wire roughness on the performance of the Wortmann FX 63-137 airfoil at low Reynolds numbers p 139 A86-16322

Influence of rough runways on undercarriage design p 166 A86-19277

**SWEPT FORWARD WINGS**

Configuration and longitudinal wind tunnel testing]hy] of forward-swept wings p 181 N86-14449

**SWEPT WINGS**

Numerical computation of unsteady transonic flow about wings with flaps [AIAA PAPER 85-1712] p 144 A86-17849

Numerical solutions for three-dimensional cases: Swept wings p 154 N86-15263

**SWEPTBACK WINGS**

Configuration and longitudinal wind tunnel testing]hy] of forward-swept wings p 181 N86-14449

**SWIRLING**

A linearized theory for swirling supersonic jets and its application to shock-cell noise p 186 A86-17137

**SYMBOLS**

The interactive generation of alphanumerics and symbology with designs on the future [AD-A159218] p 192 N86-14982

**SYNTHETIC APERTURE RADAR**
Basic characteristics of radar antenna with synthesized aperture tracking arbitrary motion of aircraft p 189 N86-15575

**SYSTEMS ANALYSIS**
Restructuring the rotor analysis program C-60 p 188 N86-15292

**SYSTEMS INTEGRATION**
Parts integration - Advantages and problems --- in aircraft design p 133 A86-16207
Observations on helicopter integrated system testing based on F/A-18 experiences p 134 A86-18417
A structured approach for integration and test of avionics systems p 170 A86-18423
Toward an avionics supersystem p 172 A86-16552
Information-measurement complexes of flight vehicles --- Russian textbook p 172 A86-18743

**SYSTEMS SIMULATION**
Simulating the total system, warts and all --- automatic target acquisition for LHX helicopter p 164 A86-18422

## T

**TAKEOFF**
Engine-out take-off climb - An old airworthiness problem reviewed p 161 A86-17061

**TAPE RECORDERS**
Evaluation of tape recordings from an airborne digital recorder p 170 A86-16858
Processing of airborne tape recordings with the aid of user programs for monitoring the technical condition of aircraft p 133 A86-16860

**TARGET ACQUISITION**
Simulating the total system, warts and all --- automatic target acquisition for LHX helicopter p 164 A86-18422

**TARGETS**
Number of targets threatened simultaneously (NOTTS) in conjunction with over the horizon back-scatter (OTHB) radar coverage
[AD-A159304] p 189 N86-15528

**TASKS**
Analytical methods for LHX mission and task analysis p 157 A86-18452

**TAXIING**
Long taxi rolls can lead to catastrophic blow-outs p 157 A86-17063

**TECHNOLOGY ASSESSMENT**
Application of mechanics to flight-simulator problems p 179 A86-16853
The past, the present, and the future of aircraft test and diagnostic technology p 179 A86-16854
Overview of advanced display technologies p 171 A86-18455
Advanced light emitting diode (LED) displays-paced by technology or systems application? p 171 A86-18458
Helicopter cockpit avionics development or the advanced transport and next generation aircraft p 171 A86-18461
Aerospace highlights 1985 p 195 A86-19052
Study of high speed combustion flows by laser velocimetry
[NASA-CR-176439] p 190 N86-15668

**TEMPERATURE DEPENDENCE**
The temperature dependence of the electrical conductivity of jet fuels with antistatic additives p 183 A86-16750

**TEMPERATURE EFFECTS**
Analysis of the effects of transient heat transfer on axial flow compressor blade boundary layers
[AD-A158094] p 175 N86-15315

**TENSILE STRESS**
Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel p 184 N86-15346

**TERMINAL GUIDANCE**
An analytical modularized treatment of autopilots for guided projectile simulations
[AD-A159311] p 182 N86-14282

**TEST CHAMBERS**
Hovering model helicopter rotor testing p 179 A86-18412

**TEST EQUIPMENT**
Drive train simulation requirements for development of helicopter overrunning clutches p 186 A86-17071

**TEST FACILITIES**
Performance and loads data from a hover test of a full-scale XV-15 rotor
[NASA-TM-86833] p 152 N86-15243

**TEST STANDS**
An analysis of cross-coupling of a multicomponent jet engine test stand using finite element modeling techniques
[NASA-CR-176424] p 181 N86-15323

**TEXTBOOKS**
Aircraft design --- Book p 161 A86-16213

**THERMAL ANALYSIS**
A methodology for analyzing laser-induced structural damage p 186 A86-17791

**THERMAL CONTROL COATINGS**
Thermal barrier coatings for jet engine improvement p 183 A86-16278
Flame rig testing of thermal barrier coatings and correlation with engine results p 173 A86-17491

**THERMAL CYCLING TESTS**
Thermal barrier coatings for jet engine improvement p 183 A86-16278

**THERMAL STABILITY**
Dynamic thermal analysis characterizations of electron-beam cured adhesives p 182 A86-16234

**THERMAL STRESSES**
Flame rig testing of thermal barrier coatings and correlation with engine results p 173 A86-17491

**THERMOCOUPLES**
Dynamic gas temperature measurement system. Volume 2: Operation and program manual
[NASA-CR-168267] p 190 N86-15651

**THIN AIRFOILS**
Large-scale separation and hysteresis in cascades p 145 A86-18577

**THIN BODIES**
Mathematical solution for unsteady subsonic flow past a thin profile in a channel p 140 A86-16851

**THIN FILMS**
A thin film electroluminescent display for cockpit applications p 171 A86-18456

**THIN PLATES**
A compressible laminar boundary layer on a plane triangular plate with an attached shock wave p 146 A86-18902

**THREE DIMENSIONAL BODIES**
The effect of a shock layer on the viscous resistance of star-shaped bodies with flat side faces p 140 A86-16691

**THREE DIMENSIONAL BOUNDARY LAYER**
On the effects of boundary-layer transition on a cylindrical afterbody at incidence in low-speed flow p 135 A86-16250
Mean-flow measurements in a supersonic three-dimensional turbulent boundary layer p 141 A86-17059
Calculation of three-dimensional shock/turbulent boundary-layer interaction generated by sharp fin p 142 A86-17135
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17645
Numerical calculation of leading-edge vortices on a flat delta wing p 148 N86-14232
Simulation of three-dimensional viscous transonic flows p 148 N86-14233
Review of research in numerical aerodynamics at the DFVLR in Brunswick p 150 N86-14248
Procedure for solution of the full potential equation at Dornier GmbH p 150 N86-14249

**THREE DIMENSIONAL FLOW**
Three-dimensional solutions to the Euler equations with one million grid points p 142 A86-17150
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17636
False diffusion in three-dimensional flow calculations p 143 A86-17653
Nonplanar, subsonic, three-dimensional oscillatory piecewise continuous kernel function method p 162 A86-17779
Procedure for solution of the Euler equations at Dornier GmbH p 149 N86-14242
Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data
[NASA-TM-86816] p 186 N86-14555
Reference test cases and contributors p 154 N86-15261
Numerical solutions for three-dimensional cases: Swept wings p 154 N86-15263
Numerical solutions for three-dimensional cases: Delta wings p 155 N86-15264
Recent developments in three-dimensional wake analysis p 156 N86-15273
Numerical simulation of viscous supersonic flow over a generic fighter configuration
[NASA-TM-86823] p 190 N86-15627

**THRUST AUGMENTATION**
The influence of forward flight on thrust augmenting ejectors
[AIAA PAPER 85-1569] p 173 A86-17843

**THRUST VECTOR CONTROL**
Three-axis electrofluidic angular rate sensor for ejection seat steering thrust vector control
[AD-A159413] p 159 N86-15277
An analysis of cross-coupling of a multicomponent jet engine test stand using finite element modeling techniques
[NASA-CR-176424] p 181 N86-15323

**THUNDERSTORMS**
Mobile intercept of storms p 191 N86-15771

**TIP SPEED**
Fundamental study of flow field generated by rotorcraft blades using wide-field shadowgraph
[NASA-CR-176443] p 152 N86-15249

**TITANIUM ALLOYS**
Interpretation and evaluation of fatigue properties of cast, HIP and heat treated titanium UH-60A M. R. Hub p 183 A86-18434

**TOLLMEIN-SCHLICHTING WAVES**
F-111 natural laminar flow glove flight test data analysis and boundary layer stability analysis
[NASA-CR-166051] p 168 N86-15305

**TOPOGRAPHY**
Use of a stored topographic data base in the modern military helicopter p 171 A86-18459

**TORSION**
The influence of dynamic inflow and torsional flexibility on rotor damping in forward flight from symbolically generated equations p 177 N86-15295
Flap-lag-torsion stability in forward flight p 177 N86-15296
Dynamic stability of a bearingless circulation control rotor blade in hover p 177 N86-15297

**TORSIONAL STRESS**
Torsional low cycle fatigue of spline-ended drive components p 187 A86-18431
Development of an unsteady aerodynamics model to improve correlation of computed blade stresses with test data p 156 N86-15288
Aeroelastic considerations for torsionally soft rotors p 157 N86-15289

**TORSIONAL VIBRATION**
On the teaching of the principles of wing flexure-torsion flutter p 185 A86-16248
Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover p 177 N86-15286

**TOUGHNESS**
Failure mechanisms of laminates transversely loaded by bolt push-through
[NASA-TM-87603] p 184 N86-14314

**TRACKING RADAR**
Basic characteristics of radar antenna with synthesized aperture tracking arbitrary motion of aircraft p 189 N86-15575

**TRADEOFFS**
Light helicopter family trade-off analysis. Volume 4: Appendix N
[AD-A158075] p 168 N86-15306
Light helicopter family trade-off analysis. Volume 7: Appendix R
[AD-A158076] p 168 N86-15307
Light helicopter family trade-off analysis. Volume 8: Appendices S and T
[AD-A158077] p 169 N86-15308
Light helicopter family trade-off analysis. Volume 10: Appendices V, W, X, and Z
[AD-A158079] p 169 N86-15309

**TRAILING EDGE FLAPS**
Numerical computation of unsteady transonic flow about wings with flaps
[AIAA PAPER 85-1712] p 144 A86-17849
Reference test cases and contributors p 154 N86-15261

**TRAILING EDGES**
Experiments on unsteady flows about wing sections p 138 A86-16318
Summary report on the working group on conference 2: Solutions of the Euler equations p 148 N86-14227
Trailing edge flow with transonic profiles p 149 N86-14240
A procedure for solution of full potential equations with correction of the trailing edge condition p 150 N86-14246
The properties of a row of trailing vortices generated in the uniform flow. The path of trailing vortex
[REPT-1] p 151 N86-14422
The properties of a row of trailing vortices generated in the uniform flow. Shape of trailing vortex and its streamwise variation
[REPT-2] p 151 N86-14423
Vortices and pressure waves at trailing edges
[ISL-CO-224/84] p 153 N86-15252

**TRAINING AIRCRAFT**
A study of aircraft motion stability in steady spin p 176 A86-19070

**TRAINING SIMULATORS**
Advanced simulator for pilot training: Effects of collimation on accommodation and vergence
[AD-A159545] p 181 N86-14279

**TRAJECTORIES**

An optimisation method for reconstruction of flight path trajectories from non-synchronous time-sampled observations by two cine cameras
[ARL-SYS-R-34] p 167 N86-15279

**TRAJECTORY ANALYSIS**

Influence of the dropping conditions on container motion near the carrier and on the impact parameters
p 158 A86-19069

**TRANSFER FUNCTIONS**

An analytical modularized treatment of autopilots for guided projectile simulations
[AD-A159311] p 182 N86-14282

**TRANSITION FLOW**

An analysis of a separation bubble transition criterion at low Reynolds numbers p 137 A86-16309

Streamwise and spanwise vortical patterns visualized over airfoils in unsteady flow p 138 A86-16319

**TRANSMISSION**

Evaluation of a load cell model for dynamic calibration of the rotor systems research aircraft
p 168 N86-15304

**TRANSMISSIONS (MACHINE ELEMENTS)**

Testing large transmissions p 167 A86-18426

**TRANSONIC FLIGHT**

Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data
[NASA-TM-86816] p 188 N86-14555

**TRANSONIC FLOW**

The application of laser anemometry to the study of transonic shock boundary-layer interactions
p 139 A86-16352

Investigations of transonic Ludwieg tubes. III - Effects of plenum exhaust system on starting process of tunnel test section p 140 A86-16838

Transonic rotor flow-measurement technique using holographic interferometry p 141 A86-17069

A theoretical basis for extending surface-paneling methods to transonic flow p 142 A86-17131

A transonic wing-body flowfield calculation with improved grid topology p 142 A86-17134

On a weak solution for a transonic flow problem
p 143 A86-17738

Application of NLR's calculation methods to transonic flow about oscillating wings p 143 A86-17778

Computation of flowfields in high solidity and high turning angle cascades using Euler equations
[AIAA PAPER 85-1705] p 144 A86-17847

Numerical computation of unsteady transonic flow about wings with flaps
[AIAA PAPER 85-1712] p 144 A86-17849

On the numerical solution of nonlinear problems in fluid dynamics by least squares and finite element methods. II Applications to transonic flow simulations
p 144 A86-17886

Some recent developments in numerical methods for transonic flows p 144 A86-17889

Unsteady transonic flows in an axial flow compressor
p 145 A86-18529

Computation of unsteady transonic flows with an implicit numerical method for solving the Euler equations
p 145 A86-18686

Acta aeronautica et astronautic sinica (selected articles)
[AD-A158454] p 135 N86-14216

Theoretical and experimental flow fields for a supersonic cruise fighter forebody

Mathematical solution for unsteady subsonic flow past a thin profile in a channel p 140 A86-16851
Application of NLR's calculation methods to transonic flow about oscillating wings p 143 A86-17778
Numerical computation of unsteady transonic flow about wings with flaps
[AIAA PAPER 85-1712] p 144 A86-17849
Unsteady transonic flows in an axial flow compressor p 145 A86-18529
Computation of unsteady transonic flows with an implicit numerical method for solving the Euler equations p 145 A86-18686

**USER MANUALS (COMPUTER PROGRAMS)**
Dynamic gas temperature measurement system. Volume 2: Operation and program manual
[NASA-CR-168267] p 190 N86-15651

## V

**V GROOVES**
High-speed braking of an aircraft tire on grooved surfaces p 162 A86-17787

**V/STOL AIRCRAFT**
The influence of forward flight on thrust augmenting ejectors
[AIAA PAPER 85-1589] p 173 A86-17843

**VANES**
Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha times beta vane
[NAL-TR-852] p 172 N86-15312

**VAPOR PHASES**
Variability of major organic components in aircraft fuels
[AD-A159057] p 185 N86-15415

**VARIABILITY**
Variability of major organic components in aircraft fuels,
[AD-A159057] p 185 N86-15415

**VARIABLE STREAM CONTROL ENGINES**
Preliminary design of a supersonic cruise aircraft high-pressure turbine
[NASA-CR-174878] p 174 N86-14272

**VELOCITY DISTRIBUTION**
Semiempirical method for predicting vortex-induced rolling moments
[NASA-TM-87579] p 147 N86-14222
Quasi nonstretching hypervelocity jets
[ISL-CO-236/84] p 153 N86-15254

**VELOCITY MEASUREMENT**
Study of high speed combustion flows by laser velocimetry
[NASA-CR-176439] p 190 N86-15668

**VERTICAL LANDING**
Characteristics of the design of VTOL jet aircraft --- Russian book p 162 A86-17600

**VERTICAL TAKEOFF AIRCRAFT**
Characteristics of the design of VTOL jet aircraft --- Russian book p 162 A86-17600
The AV-8B fatigue test program p 165 A86-18443

**VERY HIGH FREQUENCY RADIO EQUIPMENT**
VHF-AM communications equipment selection and installation practices for helicopters
[DOT/FAA/PM-85/8] p 189 N86-15518

**VIBRATION**
Rotorcraft Dynamics 1984
[NASA-CP-2400] p 167 N86-15280
An examination of the relations between rotor vibratory loads and airframe vibrations p 177 N86-15299
Coupled rotor-body vibrations with inplane degrees of freedom p 177 N86-15301
Analysis of potential helicopter vibration reduction concepts p 178 N86-15302
Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel p 184 N86-15346

**VIBRATION DAMPING**
Response of a rotorcraft model with damping non-linearities p 162 A86-17698
Nonlinear dynamics of a helicopter model in ground resonance p 177 N86-15284

**VIBRATIONAL STRESS**
Development of an unsteady aerodynamics model to improve correlation of computed blade stresses with test data p 156 N86-15288

**VIBRATORY LOADS**
Modal constraints on structural dynamic force determination p 161 A86-17070
Aeroelastic considerations for torsionally soft rotors p 157 N86-15289

**VISCOSITY**
Calculation of axisymmetric laminar supersonic flows over blunt bodies p 146 N86-14234

**VISCOUS DRAG**
The effect of a shock layer on the viscous resistance of star-shaped bodies with flat side faces p 140 A86-16691
Aircraft drag reduction technology: A summary p 155 N86-15267

**VISCOUS FLOW**
A viscous-inviscid coupling method for the design of low Reynolds number airfoil sections p 136 A86-16305
Computational and theoretical studies of unsteady viscous aerodynamics p 137 A86-16307
Computational study of flow over Miley and Wortmann airfoils p 138 A86-16317
Experiments with several elements for viscous incompressible flows p 186 A86-16833
On a weak solution for a transonic flow problem p 143 A86-17738
Supersonic viscous-inviscid interaction of a swept compression ramp with a turbulent boundary layer
[AIAA PAPER 85-1669] p 143 A86-17826
Large-scale separation and hysteresis in cascades p 145 A86-18577
Simulation of three-dimensional viscous transonic flows p 148 N86-14233
Prediction of the drag of wings at subsonic speeds by viscous/inviscid interaction techniques p 156 N86-15274
Numerical simulation of viscous supersonic flow over a generic fighter configuration
[NASA-TM-86823] p 190 N86-15627

**VISUAL AIDS**
Avionics system for future civil helicopters
[BMFT-FB-W-85-005] p 160 N86-14266

**VISUAL PERCEPTION**
Advanced simulator for pilot training: Effects of collimation on accommodation and vergence
[AD-A159545] p 181 N86-14279

**VORTEX SHEDDING**
Experiments on unsteady flows about wing sections p 138 A86-16318
Vortices incident upon a leading edge - Instantaneous pressure fields p 141 A86-17060
The vortex patterns of dynamic separation - A parametric and comparative study p 145 A86-18534
Vortices and pressure waves at trailing edges
[ISL-CO-224/84] p 153 N86-15252

**VORTEX SHEETS**
Model for analytically describing edge vortices p 140 A86-16867
Determination of the intensity of a free vortex sheet in the context of airfoil theory p 146 A86-18904

**VORTICES**
Streamwise and spanwise vortical patterns visualized over airfoils in unsteady flow p 138 A86-16319
Longitudinal vortices imbedded in turbulent boundary layers. I - Single vortex p 186 A86-17043
Methods for rotor aerodynamic and dynamic analysis p 161 A86-17068
Vortex-fitted potential and vortex-captured Euler solution for leading-edge vortex flow p 142 A86-17149
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17636
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17845
The vortex patterns of dynamic separation - A parametric and comparative study p 145 A86-18534
Noise generated by a stretching vortex p 193 A86-18689
Semiempirical method for predicting vortex-induced rolling moments
[NASA-TM-87579] p 147 N86-14222
Solutions of the Navier-Stokes equations for vortical flow p 148 N86-14231
The properties of a row of trailing vortices generated in the uniform flow. The path of trailing vortex
[REPT-1] p 151 N86-14422
The properties of a row of trailing vortices generated in the uniform flow. Shape of trailing vortex and its streamwise variation
[REPT-2] p 151 N86-14423
Vortices and pressure waves at trailing edges
[ISL-CO-224/84] p 153 N86-15252

**VORTICITY**
Summary report on the working group for conference 1: Solutions of the Navier-Stokes equations p 147 N86-14226

## W

**WAKES**
Methods for rotor aerodynamic and dynamic analysis p 161 A86-17068
Prediction of the drag of wings at subsonic speeds by viscous/inviscid interaction techniques p 156 N86-15274

**WALL FLOW**
Attached cavitation and the boundary layer - Experimental investigation and numerical treatment p 186 A86-17032

**WALL TEMPERATURE**
Development of new combustor technologies for application to alternative aeroengine fuels, phase 1
[BMFT-FB-W-85-004] p 184 N86-14402

**WARFARE**
Modernizing tactical C3I p 159 A86-18551

**WARNING SYSTEMS**
Digital servocontroller system. Volume 2. Maintenance manual
[AD-A159066] p 179 N86-15322

**WATER**
Aircraft accident report: Vieques Air Link, Inc., Britten-Norman BN-21-6 Islander, N589SA, Vieques, Puerto Rico, August 2, 1984
[PB85-901406] p 159 N86-15276
Variability of major organic components in aircraft fuels
[AD-A159057] p 185 N86-15415

**WAVE DRAG**
Numerical solutions for three-dimensional cases: Delta wings p 155 N86-15264

**WEAPON SYSTEMS**
Operational testing experience on the AH-64A Apache p 164 A86-18418
An analytical modularized treatment of autopilots for guided projectile simulations
[AD-A159311] p 182 N86-14282

**WEAR**
Coating requirements in gas turbine engines p 173 A86-17490

**WEIGHT INDICATORS**
Magnetic suspension and balance system advanced study
[NASA-CR-3937] p 180 N86-14278

**WEIGHTING FUNCTIONS**
A new Euler algorithm based on characteristic flux extrapolation p 149 N86-14241
Development of multigrid algorithms for problems from fluid dynamics p 187 N86-14244

**WEST GERMANY**
Results of the expert study of accidents during operation of German aircraft in the homeland and abroad as well as of foreign aircraft in the homeland p 158 N86-14261
Results of the expert study of accidents during operation of German aircraft in the homeland and abroad as well as of foreign aircraft in the homeland p 159 N86-14262

**WETTING**
Surface wetting effects on a laminar flow airfoil in simulated heavy rain p 162 A86-17780

**WIND (METEOROLOGY)**
Downburst: Microburst and macroburst
[PB85-148880] p 191 N86-14826

**WIND EFFECTS**
Downburst: Microburst and macroburst
[PB85-148880] p 191 N86-14826

**WIND PRESSURE**
Acoustic and turbulence influence on low-Reynolds number wing pressure distributions p 139 A86-16323

**WIND TUNNEL APPARATUS**
Preliminary experiments in unsteady flow on airfoils at low Reynolds numbers p 138 A86-16320

Modification to the NASA Langley 4- by 7-meter tunnel for improved rotorcraft aerodynamics and acoustics
p 179 A86-18414

**WIND TUNNEL CALIBRATION**
Evaluation of a correction for sound propagation through free-jet shear layers p 193 A86-17783

**WIND TUNNEL MODELS**
Aeroelastic model,helicopter rotor testing in the Langley TDT --- Transonic Dynamics Tunnel p 163 A86-18402
The properties of a row of trailing vortices generated in the uniform flow. The path of trailing vortex
[REPT-1] p 151 N86-14422
The properties of a row of trailing vortices generated in the uniform flow. Shape of trailing vortex and its streamwise variation
[REPT-2] p 151 N86-14423

**WIND TUNNEL TESTS**
On the effects of boundary-layer transition on a cylindrical afterbody at incidence in low-speed flow
p 135 A86-16250
Propeller slipstream/wing boundary layer effects at low Reynolds numbers p 139 A86-16324
Mean flow properties measured around an aerofoil close to its maximum lift p 140 A86-16395
Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence
[AIAA PAPER 85-1686] p 143 A86-17636
Surface wetting effects on a laminar flow airfoil in simulated heavy rain p 162 A86-17780
National Specialists' Meeting on Helicopter Testing Technology, Williamsburg, VA, October 29-November 1, 1984, Proceedings p 163 A86-18401
The wind tunnel as a design tool p 179 A86-18429
The properties of a row of trailing vortices generated in the uniform flow. The path of trailing vortex
[REPT-1] p 151 N86-14422
The properties of a row of trailing vortices generated in the uniform flow. Shape of trailing vortex and its streamwise variation
[REPT-2] p 151 N86-14423
Configuration and longitudinal wind tunnel testing]hy] of forward-swept wings p 181 N86-14449
The experimental determination of the subsonic aerodynamic characteristics of an Ogive-Cylinder body including a comparison with theoretical estimates, volume 1
[CAR-8509] p 151 N86-15242
Investigation of a supersonic cruise fighter model flow field
[NASA-TM-86361] p 152 N86-15248
Test results from a dynamic model dynaflex rotor
p 167 N86-15285
Aeroelastic considerations for torsionally soft rotors
p 157 N86-15289
Prediction of wing aeroelastic effects on aircraft lift and pitching moment characteristics
[NASA-TM-87631] p 178 N86-15319
Use of hinged strakes for lateral control at high angles of attack
[AD-A158005] p 178 N86-15321

**WIND TUNNEL WALLS**
A review of adaptive wall wind tunnels
p 179 A86-17067
FLEXWAL: A computer program for predicting the wall modifications for two-dimensional, solid, adaptive-wall tunnels
[NASA-TM-54648] p 150 N86-14250

**WING FLAPS**
Flow past caret wings with flaps p 146 A86-18903
Velocity and temperature decay characteristics of inverted-profile jets
[NASA-TM-87159] p 147 N86-14223
MBB studies variable-camber wing for Airbus
p 169 N86-15449

**WING FLOW METHOD TESTS**
Conference on Low Reynolds Number Airfoil Aerodynamics, Notre Dame, IN, June 16-18, 1985, Proceedings p 136 A86-16301
An environmental aerodynamic test system for low-Reynolds-number applications p 138 A86-16315
Acoustic and turbulence influence on low-Reynolds number wing pressure distributions p 139 A86-16323

**WING LOADING**
Verification of static rotor-load measurement capabilities of the RSRA helicopter active-isolator system
p 165 A86-18428

**WING OSCILLATIONS**
On the teaching of the principles of wing flexure-torsion flutter p 185 A86-16248
Application of NLR's calculation methods to transonic flow about oscillating wings p 143 A86-17778

**WING PANELS**
Failure mechanisms of laminates transversely loaded by bolt push-through
[NASA-TM-87603] p 184 N86-14314

**WING PROFILES**
Studies on the interference of wings and propeller slipstreams p 151 N86-15241

**WING TIP VORTICES**
Experimental analysis of tip vortex by laser Doppler anemometry p 140 A86-16387
Vortices incident upon a leading edge - Instantaneous pressure fields p 141 A86-17060
Numerical solutions for three-dimensional cases: Delta wings p 155 N86-15264

**WINGLETS**
Configuration and longitudinal wind tunnel testing]hy] of forward-swept wings p 181 N86-14449

**WINGS**
Propeller slipstream/wing boundary layer effects at low Reynolds numbers p 139 A86-16324
Model for analytically describing edge vortices
p 140 A86-16867
Procedure for solution of the full potential equation at Dornier GmbH p 150 N86-14249
The properties of a row of trailing vortices generated in the uniform flow. The path of trailing vortex
[REPT-1] p 151 N86-14422
The properties of a row of trailing vortices generated in the uniform flow. Shape of trailing vortex and its streamwise variation
[REPT-2] p 151 N86-14423
Studies on the interference of wings and propeller slipstreams p 151 N86-15241
Design considerations for application of laminar flow control systems to transport aircraft p 155 N86-15270
Prediction of the drag of wings at subsonic speeds by viscous/inviscid interaction techniques
p 156 N86-15274

**WIRE**
Helicopter wire strike protection system qualification testing p 163 A86-18411
Injury pattern analysis of helicopter wire strike accidents (+Gz load) p 158 A86-18843

**WORK CAPACITY**
Light helicopter family trade-off analysis. Volume 7: Appendix R
[AD-A158076] p 168 N86-15307

**WORKLOADS (PSYCHOPHYSIOLOGY)**
Analytical methods for LHX mission and task analysis
p 157 A86-18452

**X**

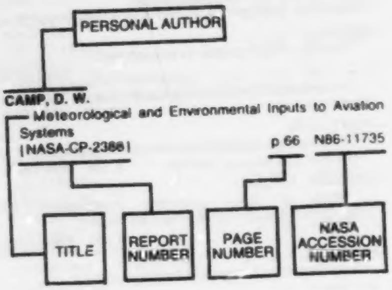
**XV-15 AIRCRAFT**
Damage tolerance analysis of components of rotor wing aircraft p 165 A86-18446
Performance and loads data from a hover test of a full-scale XV-15 rotor
[NASA-TM-86833] p 152 N86-15243

# PERSONAL AUTHOR INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 199)*

APRIL 1986

## Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**ABBITT, J. D.**
Separation bubble behavior for a NACA 23009 airfoil
p 137 A86-16312

**ABDELSALAM, M. K.**
Magnetic suspension and balance system advanced study
[NASA-CR-3937] p 180 N86-14278

**ABOUEL-SEOUD, M. S.**
An implicit finite-difference procedure for the numerical solution of unsteady supersonic flow over a blunt body
p 148 N86-14229

**ABTAHI, A. A.**
Aspect ratio effects on the aerodynamics of a Wortmann airfoil at low Reynolds number p 137 A86-16313

**ACCARDO, L.**
Experimental analysis of tip vortex by laser Doppler anemometry p 140 A86-16387

**ACETO, L. D.**
Preliminary design of a supersonic cruise aircraft high-pressure turbine
[NASA-CR-174878] p 174 N86-14272

**ACREE, C. W., JR.**
Verification of static rotor-load measurement capabilities of the RSRA helicopter active-isolator system
p 165 A86-18428

**ADAMCZYK, J. J.**
A model for closing the inviscid form of the average-passage equation system
[NASA-TM-87199] p 147 N86-14224

**ADAMS, D. O.**
Full scle fatigue testing of advanced fiber composite components p 183 A86-18437

**ADAMS, G.**
Variability of major organic components in aircraft fuels
[AD-A159057] p 185 N86-15415

**ADAMS, K. A.**
The interactive generation of alphanumerics and symbology with designs on the future
[AD-A159218] p 192 N86-14982

**ADAMSON, A.**
Propulsion for advanced commercial transports
[AIAA PAPER 85-3061] p 173 A86-17829

**ADDY, A. L.**
Multiple ducted streams with a periodic or a steady supersonic driver flow p 142 A86-17129

**AGGARWAL, H. R.**
Helicopter linear noise p 193 A86-17776

**AGRAWAL, S. K.**
High-speed braking of an aircraft tire on grooved surfaces p 162 A86-17787

**AHUJA, K. K.**
Tone excited jets. I - Introduction p 193 A86-16466
Tone excited jets IV - Acoustic measurements
p 193 A86-16469

**ALAG, G. S.**
Development of a flight test maneuver autopilot for an F-15 aircraft
[NASA-TM-86799] p 176 N86-14275

**ALBRECHT, C.**
Another look at generalized S-N curve shapes
p 187 A86-18436

**ALEX, W. F.**
SH-2F airframe fatigue test plan p 165 A86-18444

**ALLISON, D. O.**
Semiempirical method for predicting vortex-induced rolling moments
[NASA-TM-87579] p 147 N86-14222

**AMORUSO, M. J.**
An analytical modularized treatment of autopilots for guided projectile simulations
[AD-A159311] p 182 N86-14282

**ANANTHASAYANAM, M. R.**
Engine-out take-off climb - An old airworthiness problem reviewed p 161 A86-17061

**ANDERSON, J. D., JR.**
Computational study of flow over Miley and Wortmann airfoils p 138 A86-16317

**ANTONETS, A. V.**
Simple approximations of functions with additional constraints p 192 A86-18916

**ANTSELIOVICH, L. L.**
Aircraft reliability, safety, and lifetime
p 166 A86-19290

**APPLIN, Z. T.**
Modification to the NASA Langley 4- by 7-meter tunnel for improved rotorcraft aerodynamics and acoustics
p 179 A86-18414

**ARDASHEVA, M. M.**
A method for measuring pressure distribution by means of indicating coatings p 140 A86-16687

**ARMSTRONG, K. B.**
Parts integration - Advantages and problems
p 133 A86-16207

**ARMSTRONG, R. N.**
Light helicopter family trade-off analysis. Volume 7: Appendix R
[AD-A158076] p 168 N86-15307

**ARNOLD, R. T.**
Mobile intercept of storms p 191 N86-15771

**AUSTIN, E. E.**
Ground resonance analysis using a substructure modeling approach p 176 N86-15282

## B

**BACK, L. H.**
Fundamental study of flow field generated by rotorcraft blades using wide-field shadowgraph
[NASA-CR-176443] p 152 N86-15249

**BAHRAMI, H.**
Evaluation of a load cell model for dynamic calibration of the rotor systems research aircraft
p 168 N86-15304

**BAILEY, R. T.**
Development of optical diaphragm deflection sensors
[NASA-CR-175008] p 194 N86-15113

**BAKHOV, O. P.**
Aeroelasticity and dynamics of the helicopter structure
p 166 A86-18733

**BANK, W.**
Streamwise and spanwise vortical patterns visualized over airfoils in unsteady flow p 138 A86-16319

**BARE, E. A.**
Investigation of a supersonic cruise fighter model flow field
[NASA-TM-86361] p 152 N86-15248

**BARSOTTI, M. F.**
Surface wetting effects on a laminar flow airfoil in simulated heavy rain p 162 A86-17780

**BARTENWERFER, M.**
On second propagation in radial fan casings
[DFVLR-FB-85-32] p 194 N86-16053

**BARTUREN, O. M.**
Behaviour of a rectangular wing in a supersonic flow - Dynamic pressure and normal force analysis in the range 1.3-4.0 Mach p 146 A86-19005

**BASTEDO, W. G., JR.**
Performance of finite wings at low Reynolds numbers
p 138 A86-16314

**BAYLISS, A.**
A fourth-order scheme for the unsteady compressible Navier-Stokes equations
[NASA-CR-177994] p 147 N86-14221

**BECKER, F.**
Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data
[NASA-TM-86816] p 188 N86-14555

**BECKER, K.**
Development of multigrid algorithms for problems from fluid dynamics p 187 N86-14244

**BEDRIK, B. G.**
Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel
p 184 N86-15345

**BELIKOV, V.**
AN-22 test bed for advanced propeller technology
p 174 N86-14274

**BELL, H. H.**
Advanced simulator for pilot training: Effects of collimation on accommodation and vergence
[AD-A159545] p 181 N86-14279

**BELOUSOV, A. I.**
The temperature dependence of the electrical conductivity of jet fuels with antistatic additives
p 183 A86-16750

**BERMAN, A.**
Ground resonance analyses using a substructure modeling approach p 1[illegible] N86-15282

**BERNER, C.**
L.D.A. measurements in the turbulent near-wake of blunt bodies p 139 A86-16371

**BERRY, D. T.**
A flightpath overshoot flying qualities metric for the landing task
[NASA-TM-86795] p 176 N86-14276

**BERTA, E. M.**
Light helicopter family trade-off analysis. Volume 8: Appendices S and T
[AD-A158077] p 169 N86-15308

**BERTHOLD, J. W.**
Development of optical diaphragm deflection sensors
[NASA-CR-175008] p 194 N86-15113

**BERTOLOTTI, F. P.**
Effect of pressure gradients on the growth of subharmonic disturbances in boundary layers
p 136 A86-16306

**BETZINA, M. D.**
Performance and loads data from a hover test of a full-scale XV-15 rotor
[NASA-TM-86833] p 152 N86-15243

**BEVAN, D.**
The wind tunnel as a design tool p 179 A86-18429

**BLAJER, W.**
A study of aircraft motion stability in steady spin
p 176 A86-19070

**BLAKNEY, D. F.**
Tone excited jets. IV - Acoustic measurements
p 193 A86-16469

**BLUM, G.**
Numerical simulation of viscous supersonic flow over a generic fighter configuration
[NASA-TM-86823] p 190 N86-15627

**BOBBITT, P. J.**
Semiempirical method for predicting vortex-induced rolling moments
[NASA-TM-87579] p 147 N86-14222

**BOBO, S. N.**
Long taxi rolls can lead to catastrophic blow-outs
p 157 A86-17063

**BODUNOV, M. N.**
Heat transfer in cooled parts of aircraft gas-turbine engines p 174 A86-18745

**BOERMANS, L. M. M.**
Research on laminar separation bubbles at Delft University of Technology in relation to low Reynolds number airfoil aerodynamics p 137 A86-16308

**BOERSTOEL, J. W.**
Numerical methods p 154 N86-15259

**BOLZ, E. H.**
VHF-AM communications equipment selection and installation practices for helicopters
[DOT/FAA/PM-85/8] p 189 N86-15518

**BONGRAIN, [illegible]**
The disturbance of aircraft navigation and communication systems by atmospheric static electricity
p 160 A86-18695

**BONNET, J. L.**
Theoretical and experimental study of low Reynolds number transitional separation bubbles
p 137 A86-16310

**BOOM, R. W.**
Magnetic suspension and balance system advanced study
[NASA-CR-3937] p 180 N86-14278

**BOORIA, R.**
Damage tolerance analysis of components of rotor wing aircraft p 165 A86-18446

**BORLAND, C. J.**
Numerical computation of unsteady transonic flow about wings with flaps
[AIAA PAPER 85-1712] p 144 A86-17849

**BOULET, J.**
28 years of flight testing helicopters
p 161 A86-17381

**BOUSMAN, W. G.**
Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover
p 177 N86-15286

**BOZZOLA, R.**
Computation of flowfields in high solidity and high turning angle cascades using Euler equations
[AIAA PAPER 85-1705] p 144 A86-17847

**BRADSHAW, P.**
Longitudinal vortices imbedded in turbulent boundary layers. I - Single vortex p 186 A86-17043

**BRASLOW, A. L.**
Design considerations for application of laminar flow control systems to transport aircraft p 155 N86-15270

**BRENDEL, M.**
Preliminary experiments in unsteady flow on airfoils at low Reynolds numbers p 138 A86-16320

**BRIGHAM, P. B.**
Simulating the total system, warts and all
p 164 A86-18422

**BRISTEAU, M. O.**
On the numerical solution of nonlinear problems in fluid dynamics by least squares and finite element methods. II Applications to transonic flow simulations
p 144 A86-17886

**BRISTOW, J. W.**
Helicopter fatigue - The changing scene
p 165 A86-18445

**BROCKMAN, R. A.**
Finite element analysis of soft-body impact
[AD-A158436] p 158 N86-14259

**BROUSSARD, J. R.**
PIFCGT: A PIF autopilot design program for general aviation aircraft
[NASA-CR-166123] p 178 N86-15320

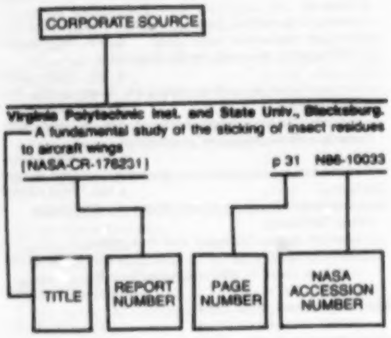
# CORPORATE SOURCE INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 199)* APRIL 1986

## Typical Corporate Source Index Listing



CORPORATE SOURCE
Virginia Polytechnic Inst. and State Univ., Blacksburg.
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231]
p 31
N86-10033
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

**Advanced Engineering Lab., Salisbury (Australia).**
Flutter generator control and force computer
[AEL-0242-TM] p 178 N86-15318

**Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).**
Test cases for inviscid flow field methods
[AGARD-AR-211] p 153 N86-15256
Aircraft Drag Prediction and Reduction
[AGARD-R-723] p 155 N86-15266

**AeroChem Research Labs., Inc., Princeton, N. J.**
Fuel effects on soot formation in turbojet engines
[AD-A159073] p 185 N86-15416

**Aeronautical Research Labs., Melbourne (Australia).**
An optimisation method for reconstruction of flight path trajectories from non-synchronous time-sampled observations by two cine cameras
[ARL-SYS-R-34] p 167 N86-15279

**Aerospace Medical Research Labs., Wright-Patterson AFB, Ohio.**
Programming a multiple-orifice hydraulic decelerator
[AD-A159426] p 181 N86-15328

**Air Force Academy, Colo.**
Number of targets threatened simultaneously (NOTTS) in conjunction with over the horizon back-scatter (OTHB) radar coverage
[AD-A159304] p 189 N86-15528

**Air Force Flight Dynamics Lab., Wright-Patterson AFB, Ohio.**
Aircraft flight performance methods. Revision 2
[AD-A158227] p 169 N86-15310

**Air Force Human Resources Lab., Brooks AFB, Tex.**
Advanced simulator for pilot training: Effects of collimation on accommodation and vergence
[AD-A159545] p 181 N86-14279

**Air Force Inst. of Tech., Wright-Patterson AFB, Ohio.**
The interactive generation of alphanumerics and symbology with designs on the future
[AD-A159216] p 192 N86-14982
Analysis of the effects of transient heat transfer on axial flow compressor blade boundary layers
[AD-A158094] p 175 N86-15315
Use of hinged strakes for lateral control at high angles of attack
[AD-A158005] p 178 N86-15321
Concepts for the development of a nondestructive testing and evaluation system for rigid airfield pavements
[AD-A158004] p 181 N86-15324

**Air Force Systems Command, Wright-Patterson AFB, Ohio.**
Acta aeronautica et astronautica sinica (selected articles)
[AD-A158454] p 135 N86-14216

**Air War Coll., Maxwell AFB, Ala.**
The F/A-18 Fighter/Attack aircraft program
[AD-A159292] p 195 N86-15205

**Arizona State Univ., Tempe.**
Boundary-layer transition: T-S waves and crossflow mechanisms p 155 N86-15268
Laminar flow control with suction: Theory and experiment p 155 N86-15269
Heat transfer characteristics within an array of impinging jets. Effects of crossflow temperature relative to jet temperature
[NASA-CR-3936] p 190 N86-15625

**Army Armament Research and Development Command, Dover, N. J.**
An analytical modularized treatment of autopilots for guided projectile simulations
[AD-A159311] p 182 N86-14282

**Army Aviation Systems Command, Moffett Field, Calif.**
Experimentally determined flutter from two- and three-bladed model bearingless rotors in hover
p 177 N86-15286

**Army Research and Technology Labs., Moffett Field, Calif.**
Hovering model helicopter rotor testing
p 170 A86-18412

**Army Structures Lab., Hampton, Va.**
Aeroelastic model helicopter rotor testing in the Langley TDT p 163 A86-18402

**Army Test and Evaluation Command, Aberdeen Proving Ground, Md.**
Cold regions logistic supportability testing of electronic, avionic and communications equipment
[AD-A158887] p 188 N86-14514

**Army Training and Doctrine Command, Fort Monroe, Va.**
Light helicopter family trade-off analysis. Volume 4: Appendix N
[AD-A158075] p 168 N86-15306
Light helicopter family trade-off analysis. Volume 7: Appendix R
[AD-A158076] p 168 N86-15307
Light helicopter family trade-off analysis. Volume 8: Appendices S and T
[AD-A158077] p 169 N86-15308
Light helicopter family trade-off analysis. Volume 10: Appendices V, W, X, and Z
[AD-A158079] p 169 N86-15309

## B

**Babcock and Wilcox Co., Alliance, Ohio.**
Development of optical diaphragm deflection sensors
[NASA-CR-175008] p 194 N86-15113

**Boeing Commercial Airplane Co., Seattle, Wash.**
Integrated Application of Active Controls (IAAC) technology to an advanced subsonic transport project: Test act system description
[NASA-CR-172221] p 176 N86-14277
F-111 natural laminar flow glove flight test data analysis and boundary layer stability analysis
[NASA-CR-166051] p 168 N86-15305

**Boeing Military Airplane Development, Seattle, Wash.**
Objectives and scope of the Working Group 07
p 153 N86-15257
Concluding remarks p 155 N86-15265

**Boeing Vertol Co., Philadelphia, Pa.**
Parametric study of the aeroelastic stability of a bearingless rotor p 176 N86-15283
Restructuring the rotor analysis program C-60
p 168 N86-15292
Planning, creating and documenting a NASTRAN finite element model of a modern helicopter
p 169 N86-15300

**Bolt, Beranek, and Newman, Inc., Cambridge, Mass.**
A fault tolerant system for an integrated avionics sensor configuration
[NASA-CR-3834] p 160 N86-15278

**Brookhaven National Lab., Upton, N. Y.**
Furfuryl alcohol polymer concretes for use in all-weather repairs of concrete and asphalt surfaces
[DE85-014825] p 184 N86-14391

## C

**California Univ., Los Angeles.**
Influence of various unsteady aerodynamic models on the aeromechanical stability of a helicopter in ground resonance p 177 N86-15294

**Carnegie-Mellon Univ., Pittsburgh, Pa.**
Stability of limit cycles in frictionally damped and aerodynamically unstable rotor stages
p 174 A86-19198

**Center for Naval Analyses, Alexandria, Va.**
The relationship between materiel failures and flight hours: Statistical considerations
[AD-A159571] p 169 N86-15311

**Chicago Univ., Ill.**
Downburst: Microburst and macroburst
[PB85-148880] p 191 N86-14826

**Cranfield Inst. of Tech., Bedford (England).**
The experimental determination of the subsonic aerodynamic characteristics of an Ogive-Cylinder body including a comparison with theoretical estimates, volume 1
[CAR-8500] p 151 N86-15242

## D

**Dayton Univ., Ohio.**
Finite element analysis of soft-body impact
[AD-A158438] p 158 N86-14259

**DEI-Tech, Inc., Newport News, Va.**
An airfoil flutter model suspension system to accommodate large static transonic airloads
[NASA-CR-177998] p 146 N86-14220

**Department of the Air Force, Washington, D.C.**
Resonant cavities for stall recovery in gas turbine engines
[AD-D011891] p 175 N86-15317
Ferromagnetic resonance probe liftoff suppression apparatus
[AD-D011913] p 190 N86-15647
Adapter pallet system
[AD-D011858] p 191 N86-15671

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Brunswick (West Germany).**
Review of research in numerical aerodynamics at the DFVLR in Brunswick p 150 N86-14248

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Cologne (West Germany).**
The effect of supply parameters on the volume of future aircraft movements p 158 N86-14258
Investigations of the aircraft landing process using a computerized simulation model based on the Monte Carlo method
[DFVLR-FB-85-27] p 167 N86-14269

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Goettingen (West Germany).**
Simulation of three-dimensional viscous transonic flows p 148 N86-14233
Calculation of axisymmetric laminar supersonic flows over blunt bodies p 148 N86-14234
Solutions of the Navier-Stokes equations with the finite volume method p 148 N86-14235
Shock design for refined recalculations
p 150 N86-14247

Calculation of separated laminar supersonic flows over blunt bodies of revolution at zero angle of attack
[DFVLR-FB-85-30] p 151 N86-14256

Transonic drag rise and drag reduction by active/passive boundary layer control p 156 N86-15275

On second propagation in radial fan casings
[DFVLR-FB-85-32] p 194 N86-16053

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Oberpfaffenhofen (West Germany).**

Results of icing flights in winter 1983/84: Ice accretion thickness in correlation with cloud physical parameters, object and cloud parameters
[DFVLR-FB-85-39] p 191 N86-15838

**Deutsche Gesellscaft fuer Luft und Raumfahrt, Bonn (West Germany).**

The state of development research in numerical aerodynamics in West Germany
[DGLR-84-01] p 147 N86-14225

Summary report on the working group for conference 1: Solutions of the Navier-Stokes equations
p 147 N86-14226

Summary report on the working group on conference 2: Solutions of the Euler equations p 148 N86-14227

**Dornier-Werke G.m.b.H., Friedrichshafen (West Germany).**

Procedure for solution of the Navier-Stokes equations at Dornier GmbH p 149 N86-14238

Procedure for solution of the Euler equations at Dornier GmbH p 149 N86-14242

Procedure for solution of the full potential equation at Dornier GmbH p 150 N86-14249

**Duke Univ., Durham, N. C.**

Nonlinear dynamics of a helicopter model in ground resonance p 177 N86-15284

## E

**Ecosystems International, Inc., Crofton, Md.**

NASA flight operations review
[NASA-CR-176404] p 135 N86-14215

## F

**Federal Aviation Administration, Washington, D.C.**

Effectiveness of the civil aviation security program
[AD-A159511] p 158 N86-14260

## G

**General Accounting Office, Washington, D. C.**

Compilation and analysis of the Federal Aviation Administration's inspection of a sample of commercial air carriers
[PB85-241198] p 159 N86-14264

**Gesellschaft fuer Mathematik und Datenverarbeitung, St. Augustin (West Germany).**

Development of multigrid algorithms for problems from fluid dynamics p 187 N86-14244

**Gesellschaft fuer Reaktorsicherheit, Garching (West Germany).**

Application of a dynamic grid adaptation in the ASWR procedure p 149 N86-14243

## H

**Howard Univ., Washington, D. C.**

Dynamic response characteristics of a circulation control rotor model pneumatic system p 157 N86-15298

**Hughes Helicopters, Culver City, Calif.**

Development of an unsteady aerodynamics model to improve correlation of computed blade stresses with test data p 156 N86-15288

## I

**Indian Inst. of Science, Bangalore.**

A review of dynamic inflow and its effect on experimental correlations p 157 N86-15293

**Information and Control Systems, Inc., Hampton, Va.**

PIFCGT: A PIF autopilot design program for general aviation aircraft
[NASA-CR-166123] p 178 N86-15320

**Institut Franco-Allemand de Recherches, St. Louis (France).**

Vortices and pressure waves at trailing edges
[ISL-CO-224/84] p 153 N86-15252

Damping of the rolling motion of full caliber fin-stabilized projectiles in supersonic flight
[ISL-CO-233/84] p 153 N86-15253

Quasi nonstretching hypervelocity jets
[ISL-CO-236/84] p 153 N86-15254

Study of high speed combustion flows by laser velocimetry
[NASA-CR-176439] p 190 N86-15668

**Institute for Defense Analyses, Alexandria, Va.**

Small turbine technology review
[AD-A158514] p 175 N86-15316

**Iowa State Univ. of Science and Technology, Ames.**

Large-scale separation and hysteresis in cascades
p 145 A86-18577

## J

**Jet Propulsion Lab., California Inst. of Tech., Pasadena.**

Fundamental study of flow field generated by rotorcraft blades using wide-field shadowgraph
[NASA-CR-176443] p 152 N86-15249

Antimisting kerosene: Development of a continuous 10 GPM in-line blender
[NASA-CR-176432] p 185 N86-15412

**Joint Publications Research Service, Arlington, Va.**

AN-22 test bed for advanced propeller technology
p 174 N86-14274

Configuration and longitudinal wind tunnel testing [hy] of forward-swept wings p 181 N86-14449

Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel
p 184 N86-15346

West Europe report: Science and technology
[JPRS-WST-85-024] p 189 N86-15447

MBB studies variable-camber wing for Airbus
p 169 N86-15449

French program CHARME develops propfan aircraft
p 169 N86-15450

Basic characteristics of radar antenna with synthesized aperture tracking arbitrary motion of aircraft
p 189 N86-15575

Method of calculating angular dimensions of flight vehicle cockpit canopy casings p 191 N86-15886

Work on putting computer and CRTs in airliner control panels p 172 N86-15947

## K

**Kaman Aerospace Corp., Bloomfield, Conn.**

Ground resonance analysis using a substructure modeling approach p 176 N86-15282

Optimal design application on the advanced aeroelastic rotor blade p 167 N86-15290

**Kansas Univ., Lawrence.**

01General aviation interior noise problem: Some suggested solutions p 194 N86-15053

**Kansas Univ. Center for Research, Inc., Lawrence.**

An analysis of cross-coupling of a multicomponent jet engine test stand using finite element modeling techniques
[NASA-CR-176424] p 181 N86-15323

## L

**Lockheed-California Co., Burbank.**

Flight service evaluation of advanced composite ailerons on the L-1011 transport aircraft
[NASA-CR-177960] p 184 N86-14317

**Lockheed Engineering and Management Services Co., Inc., Houston, Tex.**

Increasing productivity of the McAuto CAD/CAE system by user-specific applications programming
p 193 N86-15200

**Lockheed-Georgia Co., Marietta.**

Tone excited jets. I - Introduction p 193 A86-16466

Tone excited jets. IV - Acoustic measurements
p 193 A86-16469

Aircraft drag reduction technology: A summary
p 155 N86-15267

Recent developments in three-dimensional wake analysis p 156 N86-15273

**Luftfahrt-Bundesamt, Brunswick (West Germany).**

Results of the expert study of accidents during operation of German aircraft in the homeland and abroad as well as of foreign aircraft in the homeland
p 158 N86-14261

Results of the expert study of accidents during operation of German aircraft in the homeland and abroad as well as of foreign aircraft in the homeland
p 159 N86-14262

## M

**Madison Magnetics, Inc., Wis.**

Magnetic suspension and balance system advanced study
[NASA-CR-3937] p 180 N86-14278

**Maryland Univ., College Park.**

Flap-lag-torsion stability in forward flight
p 177 N86-15296

Dynamic stability of a bearingless circulation control rotor blade in hover p 177 N86-15297

**Massachusetts Inst. of Tech., Cambridge.**

Surface wetting effects on a laminar flow airfoil in simulated heavy rain p 132 A86-17780

**Messerschmitt-Boelkow-Blohm G.m.b.H., Bremen (West Germany).**

Contribution to the potential calculation of anisotropic compression shocks in a plane case
p 150 N86-14245

Integrated wing engine system (IFAS), phase 2
[BMFT-FB-W-85-008] p 151 N86-14257

**Messerschmitt-Boelkow-Blohm G.m.b.H., Munich (West Germany).**

Comparison of the Euler and potential solutions for supersonic flows over delta wings p 149 N86-14239

Trailing edge flow with transonic profiles
p 149 N86-14240

A new Euler algorithm based on characteristic flux extrapolation p 149 N86-14241

A procedure for solution of full potential equations with correction of the trailing edge condition
p 150 N86-14246

Numerical solutions for three-dimensional cases: Swept wings p 154 N86-15263

**Messerschmitt-Boelkow-Blohm G.m.b.H., Ottobrunn (West Germany).**

Avionics system for future civil helicopters
[BMFT-FB-W-85-005] p 180 N86-14266

Activities report in aerospace research
p 135 N86-15240

**Mississippi Univ., University.**

Mobile intercept of storms p 191 N86-15771

**Monsanto Co., Dayton, Ohio.**

Variability of major organic components in aircraft fuels
[AD-A159057] p 185 N86-15415

**Montana State Univ., Bozeman.**

Mean-flow measurements in a supersonic three-dimensional turbulent boundary layer
p 141 A86-17059

**Motoren- und Turbinen-Union Muenchen G.m.b.H. (West Germany).**

Development of new combustor technologies for application to alternative aeroengine fuels, phase 1
[BMFT-FB-W-85-004] p 184 N86-14402

## N

**National Aeronautical Establishment, Ottawa (Ontario).**

Reference test cases and contributors
p 154 N86-15261

**National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.**

A theoretical basis for extending surface-paneling methods to transonic flow p 142 A86-17131

A comparative study of the parabolized Navier-Stokes code using various grid-generation techniques
p 143 A86-17654

Hovering model helicopter rotor testing
p 179 A86-18412

Verification of static rotor-load measurement capabilities of the RSRA helicopter active-isolator system
p 165 A86-18428

Development of a flight test maneuver autopilot for an F-15 aircraft
[NASA-TM-86799] p 176 N86-14275

A flightpath overshoot flying qualities metric for the landing task
[NASA-TM-86795] p 176 N86-14276

Three-dimensional, transonic rotor flow field reconstructed from holographic interferogram data
[NASA-TM-86816] p 188 N86-14555

Performance and loads data from a hover test of a full-scale XV-15 rotor
[NASA-TM-86833] p 152 N86-15243

Relative advantages of thin-layer Navier-Stokes and interactive boundary-layer procedures
[NASA-TM-86778] p 152 N86-15244

A consistent spatial differencing scheme for the transonic full-potential equation in three dimensions
[NASA-TM-86716] p 152 N86-15246

Separated transonic airfoil flow calculations with a nonequilibrium turbulence model
[NASA-TM-86830] p 152 N86-15247

Rotorcraft Dynamics 1984
[NASA-CP-2400] p 167 N86-15280

The use of active controls to augment rotor/fuselage stability p 176 N86-15281

The influence of dynamic inflow and torsional flexibility on rotor damping in forward flight from symbolically generated equations p 177 N86-15295

Evaluation of a load cell model for dynamic calibration of the rotor systems research aircraft p 168 N86-15304

Stress concentration around a small circular hole in the HiMAT composite plate [NASA-TM-86038] p 184 N86-15350

Computational fluid dynamics at NASA Ames and the numerical aerodynamic simulation program [NASA-TM-86769] p 190 N86-15626

Numerical simulation of viscous supersonic flow over a generic fighter configuration [NASA-TM-86823] p 190 N86-15627

**National Aeronautics and Space Administration. Flight Research Center, Edwards, Calif.**

Flight evaluation of a digital electronic engine control in an F-15 airplane p 173 A86-17784

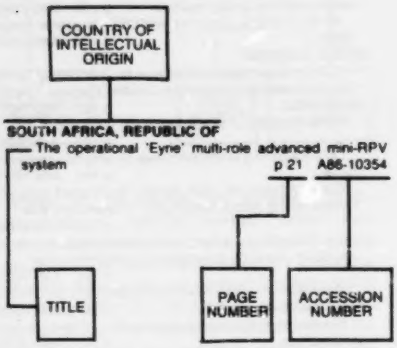
The properties of a row of trailing vortices generated in the uniform flow. The path of trailing vortex [REPT-1] p 151 N86-14422

The properties of a row of trailing vortices generated in the uniform flow. Shape of trailing vortex and its streamwise variation [REPT-2] p 151 N86-14423

# FOREIGN TECHNOLOGY INDEX

## Typical Foreign Technology Index Listing



COUNTRY OF INTELLECTUAL ORIGIN
SOUTH AFRICA, REPUBLIC OF
The operational 'Eyrie' multi-role advanced mini-RPV system p 21 A86-10354
TITLE
PAGE NUMBER
ACCESSION NUMBER

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section.

### A

**ARGENTINA**

Behaviour of a rectangular wing in a supersonic flow - Dynamic pressure and normal force analysis in the range 1.3-4.0 Mach p 146 A86-19005

**AUSTRALIA**

Modelling for fatigue crack growth prediction in aircraft p 161 A86-17011

Turbulent-boundary-layer development in an adverse pressure gradient after an interaction with a normal shock wave p 141 A86-17031

An optimisation method for reconstruction of flight path trajectories from non-synchronous time-sampled observations by two cine cameras [ARL-SYS-R-34] p 167 N86-15279

Flutter generator control and force computer [AEL-0242-TM] p 178 N86-15318

### C

**CANADA**

Experiments with several elements for viscous incompressible flows p 186 A86-16833

Advanced light emitting diode (LED) displays-paced by technology or systems application? p 171 A86-18458

Reference test cases and contributors p 154 N86-15261

**CHINA, PEOPLE'S REPUBLIC OF**

Acta aeronautica et astronautic sinica (selected articles) [AD-A158454] p 135 N86-14216

Configuration and longitudinal wind tunnel testing [hy] of forward-swept wings p 181 N86-14449

**CZECHOSLOVAKIA**

Mathematical solution for unsteady subsonic flow past a thin profile in a channel p 140 A86-16851

Application of mechanics to flight-simulator problems p 179 A86-16853

The past, the present, and the future of aircraft test and diagnostic technology p 179 A86-16854

An aircraft maintenance and repair strategy using a test and diagnostic system p 133 A86-16855

Evaluation of tape recordings from an airborne digital recorder p 170 A86-16858

A study of the operating condition of aircraft from the recordings of the onboard recording equipment p 133 A86-16859

Processing of airborne tape recordings with the aid of user programs for monitoring the technical condition of aircraft p 133 A86-16860

Using diagnostic systems to collect data on the reliability of aircraft p 133 A86-16861

The possibility of using a flight recorder for the analysis of pilot performance p 170 A86-16862

### F

**FRANCE**

Theoretical and experimental study of low Reynolds number transitional separation bubbles p 137 A86-16310

The application of laser anemometry to the study of transonic shock boundary-layer interactions p 139 A86-16352

L.D.A. measurements in the turbulent near-wake of blunt bodies p 139 A86-16371

Attached cavitation and the boundary layer - Experimental investigation and numerical treatment p 186 A86-17032

28 years of flight testing helicopters p 161 A86-17381

Solution of the Euler equations - Explicit schemes acceleration by a multigrid method [ONERA, TP NO. 1985-129] p 142 A86-17627

Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence [AIAA PAPER 85-1686] p 143 A86-17636

Experimental investigation of three dimensional separation on an ellipsoid-cylinder body at incidence [AIAA PAPER 85-1686] p 143 A86-17845

On the numerical solution of nonlinear problems in fluid dynamics by least squares and finite element methods. II Applications to transonic flow simulations p 144 A86-17886

Shock wave/turbulent boundary layer interaction and its control p 145 A86-18535

Computation of unsteady transonic flows with an implicit numerical method for solving the Euler equations p 145 A86-18686

Noise generated by a stretching vortex p 193 A86-18689

The evolution of the cockpit displays in commercial airlines p 172 A86-18694

The disturbance of aircraft navigation and communication systems by atmospheric static electricity p 160 A86-18695

Interference with aeronautical aids to navigation (frequencies of 108-118 MHz) by high power FM radio broadcasts (88-108 MHz) p 160 A86-18696

Vortices and pressure waves at trailing edges [ISL-CO-224/84] p 153 N86-15252

Damping of the rolling motion of full caliber fin-stabilized projectiles in supersonic flight [ISL-CO-233/84] p 153 N86-15253

Quasi nonstretching hypervelocity jets [ISL-CO-236/84] p 153 N86-15254

Test cases for inviscid flow field methods [AGARD-AR-211] p 153 N86-15256

Numerical solutions of two-dimensional reference test cases p 154 N86-15262

Aircraft Drag Prediction and Reduction [AGARD-R-723] p 155 N86-15266

Parasitic and interference drag prediction and reduction p 156 N86-15272

West Europe report: Science and technology [JPRS-WST-85-024] p 189 N86-15447

French program CHARME develops propfan aircraft p 169 N86-15450

Study of high speed combustion flows by laser velocimetry [NASA-CR-176439] p 190 N86-15668

### G

**GERMANY,FEDERAL REPUBLIC OF**

Thermal barrier coatings for jet engine improvement p 183 A86-16278

Airfoil design for Reynolds numbers between 50,000 and 500,000 p 136 A86-16302

Experiments on unsteady flows about wing sections p 138 A86-16318

Claude Dornier - Pioneer of aviation; Academic Seminar, Technische Universitaet Muenchen, Munich, West Germany, October 24, 1984, Papers p 195 A86-16325

Model for analytically describing edge vortices p 140 A86-16867

A review of adaptive wall wind tunnels p 179 A86-17067

Flame rig testing of thermal barrier coatings and correlation with engine results p 173 A86-17491

False diffusion in three-dimensional flow calculations p 143 A86-17653

DFVLR, Annual Report 1984 p 135 A86-19284

The state of development research in numerical aerodynamics in West Germany [DGLR-84-01] p 147 N86-14225

Summary report on the working group for conference 1: Solutions of the Navier-Stokes equations p 147 N86-14226

Summary report on the working group on conference [illegible] s of the Euler equations p 148 N86-14227

An implicit finite-difference procedure for the numerical solution of unsteady supersonic flow over a blunt body p 148 N86-14229

Solutions of the Navier-Stokes equations for vortical flow p 148 N86-14231

Numerical calculation of leading-edge vortices on a flat delta wing p 148 N86-14232

Simulation of three-dimensional viscous transonic flows p 148 N86-14233

Calculation of axisymmetric laminar supersonic flows over blunt bodies p 148 N86-14234

Solutions of the Navier-Stokes equations with the finite volume method p 148 N86-14235

A Navier-Stokes procedure for simulation of two-dimensional and quasi two-dimensional grid flows p 149 N86-14236

Procedure for solution of the Navier-Stokes equations at Dornier GmbH p 149 N86-14238

Comparison of the Euler and potential solutions for supersonic flows over delta wings p 149 N86-14239

Trailing edge flow with transonic profiles p 149 N86-14240

A new Euler algorithm based on characteristic flux extrapolation p 149 N86-14241

Procedure for solution of the Euler equations at Dornier GmbH p 149 N86-14242

Application of a dynamic grid adaptation in the ASWR procedure p 149 N86-14243

Development of multigrid algorithms for problems from fluid dynamics p 187 N86-14244

Contribution to the potential calculation of anisotropic compression shocks in a plane case p 150 N86-14245

A procedure for solution of full potential equations with correction of the trailing edge condition p 150 N86-14246

Shock design for refined recalculations p 150 N86-14247

Review of research in numerical aerodynamics at the DFVLR in Brunswick p 150 N86-14248

Procedure for solution of the full potential equation at Dornier GmbH p 150 N86-14249

Calculation of separated laminar supersonic flows over blunt bodies of revolution at zero angle of attack [DFVLR-FB-85-30] p 151 N86-14256

Integrated wing engine system (IFAS), phase 2 [BMFT-FB-W-85-008] p 151 N86-14257

The effect of supply parameters on the volume of future aircraft movements p 158 N86-14258

Results of the expert study of accidents during operation of German aircraft in the homeland and abroad as well as of foreign aircraft in the homeland p 158 N86-14261

Results of the expert study of accidents during operation of German aircraft in the homeland and abroad as well as of foreign aircraft in the homeland p 159 N86-14262

Avionics system for future civil helicopters [BMFT-FB-W-85-005] p 160 N86-14266

Investigations of the aircraft landing process using a computerized simulation model based on the Monte Carlo method [DFVLR-FB-85-27] p 167 N86-14269

Development of new combustor technologies for application to alternative aeroengine fuels, phase 1 [BMFT-FB-W-85-004] p 184 N86-14402

Activities report in aerospace research p 135 N86-15240

Numerical solutions for three-dimensional cases: Swept wings p 154 N86-15263

Transonic drag rise and drag reduction by active/passive boundary layer control p 156 N86-15275

MBB studies variable-camber wing for Airbus p 169 N86-15449

Results of icing flights in winter 1983/84: Ice accretion thickness in correlation with cloud physical parameters, object and cloud parameters [DFVLR-FB-85-39] p 191 N86-15838

On second propagation in radial fan casings [DFVLR-FB-85-32] p 194 N86-16053

The Microwave Landing System (MLS) p 160 A86-18723

Aspects of current interest concerning the development of world air traffic. II p 135 A86-18724

Turbofan engines for commercial aircraft p 173 A86-18725

## I

**INDIA**

Engine-out take-off climb - An old airworthiness problem reviewed p 161 A86-17061

Stability of large damped flexible spacecraft with stored angular momentum p 182 A86-18355

A review of dynamic inflow and its effect on experimental correlations p 157 N86-15293

**ISRAEL**

Nonplaner, subsonic, three-dimensional oscillatory piecewise continuous kernel function method p 162 A86-17779

**ITALY**

Experimental analysis of tip vortex by laser Doppler anemometry p 140 A86-16387

Experimental characterization of cracks at straight attachment lugs p 186 A86-16821

Exact solutions to transonic and supersonic flows p 154 N86-15260

## J

**JAPAN**

Manufacturing advance towards high strain fibers p 182 A86-16203

Investigations of transonic Ludwieg tubes. III - Effects of plenum exhaust system on starting process of tunnel test section p 140 A86-16838

Acoustic recognition of aircraft types in flight p 193 A86-18121

Grid generation for single airfoil using conformal mapping [NAL-TR-8511] p 146 N86-14217

Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha x beta vane [NAL-TR-852] p 172 N86-14270

The properties of a row of trailing vortices generated in the uniform flow. The path of trailing vortex [REPT-1] p 151 N86-14422

The properties of a row of trailing vortices generated in the uniform flow. Shape of trailing vortex and its streamwise variation [REPT-2] p 151 N86-14423

Dynamic characteristics of air data sensor systems: Altimeter, speedometer and alpha times beta vane [NAL-TR-852] p 172 N86-15312

## N

**NETHERLANDS**

Research on laminar separation bubbles at Delft University of Technology in relation to low Reynolds number airfoil aerodynamics p 137 A86-16308

Vortex-fitted potential and vortex-captured Euler solution for leading-edge vortex flow p 142 A86-17149

Application of NLR's calculation methods to transonic flow about oscillating wings p 143 A86-17778

Fuel saving by optimal integration of on-board avionics and air traffic control [NLR-MP-84035-U] p 159 N86-14263

Numerical methods p 154 N86-15259

**NORWAY**

Formulation of the Euler boundary value problem p 154 N86-15258

## P

**POLAND**

Influence of the dropping conditions on container motion near the carrier and on the impact parameters p 158 A86-19069

A study of aircraft motion stability in steady spin p 176 A86-19070

## R

**ROMANIA (RUMANIA)**

Drag reduction of perforated axisymmetric bodies in supersonic flow p 144 A86-18047

## S

**SWEDEN**

Three-dimensional solutions to the Euler equations with one million grid points p 142 A86-17150

**SWITZERLAND**

Stealth p 134 A86-17434

Testing time for AMX - The close support specialist moves towards production p 162 A86-17435

## U

**U.S.S.R.**

A method for measuring pressure distribution by means of indicating coatings p 140 A86-16687

The effect of a shock layer on the viscous resistance of star-shaped bodies with flat side faces p 140 A86-16691

The temperature dependence of the electrical conductivity of jet fuels with antistatic additives p 183 A86-16750

The dynamics of elastic bars under conditions of arbitrary kinematic excitation p 185 A86-16761

Self-similar supersonic gas flows through a permeable screen p 140 A86-16784

Stability of the steady-state gliding of a flight vehicle p 175 A86-16787

Structure of a supersonic turbulent boundary layer during its interaction with a shock wave p 141 A86-17096

Supercritical mode of the nonlinear interaction of subsonic and supersonic inviscid jets in a two-dimensional channel p 142 A86-17098

Characteristics of the design of VTOL jet aircraft p 162 A86-17600

The effect of the curvature of the external contours of turbine blade profiles on their aerodynamic characteristics p 144 A86-18152

Aeroelasticity and dynamics of the helicopter structure p 186 A86-18733

An introduction to the theory of nonlinear vibrations of aircraft structures p 187 A86-18739

The oxygen equipment of passenger aircraft p 166 A86-18740

Information-measurement complexes of flight vehicles p 172 A86-18743

Heat transfer in cooled parts of aircraft gas-turbine engines p 174 A86-18745

A compressible laminar boundary layer on a plane triangular plate with an attached shock wave p 146 A86-18902

Flow past caret wings with flaps p 146 A86-18903

Determination of the intensity of a free vortex sheet in the context of airfoil theory p 146 A86-18904

Heat transfer at the lateral surface of a blunt cone during the absorption of the entropy layer by a laminar or a turbulent boundary layer p 187 A86-18907

Simple approximations of functions with additional constraints p 192 A86-18918

Spatial orientation of an aircraft during the execution of lateral maneuvers p 175 A86-18987

Analytical estimation of the variance of error in determining geographic-meridian direction by the gyrocompass method with random oscillation of the base p 160 A86-18990

Critical permeability parameter in supersonic gradient flow p 146 A86-19148

Aircraft reliability, safety, and lifetime p 166 A86-19290

AN-22 test bed for advanced propeller technology p 174 N86-14274

Effects of vibration-induced cavitation of physicochemical characteristics of aircraft fuel p 184 N86-15346

Basic characteristics of radar antenna with synthesized aperture tracking arbitrary motion of aircraft p 189 N86-15575

Method of calculating angular dimensions of flight vehicle cockpit canopy casings p 191 N86-15886

Work on putting computer and CRTs in airliner control panels p 172 N86-15947

**UNITED KINGDOM**

Carbon fibres: Uses and prospects; Proceedings of the Third International Conference, London, England, October 8-10, 1985 p 182 A86-16201

Parts integration - Advantages and problems p 133 A86-16207

On the teaching of the principles of wing flexure-torsion flutter p 185 A86-16248

Static and dynamic pitch stability of a blunted cone with forward facing aerodynamic spike in hypersonic flow p 135 A86-16249

On the effects of boundary-layer transition on a cylindrical afterbody at incidence in low-speed flow p 135 A86-16250

Mean flow properties measured around an aerofoil close to its maximum lift p 140 A86-16395

Structural materials in aeronautics - Prospects and perspectives p 183 A86-16866

Longitudinal vortices imbedded in turbulent boundary layers. I - Single vortex p 186 A86-17043

A linearized theory for swirling supersonic jets and its application to shock-cell noise p 186 A86-17137

Big Picture - Answer to the big problem? p 170 A86-17172

Airline efficiency p 157 A86-17174

For agile read active p 175 A86-17175

Design against corrosion p 161 A86-17382

The fighter. III p 162 A86-17523

Avionics update 1986 p 170 A86-17524

2001 Phantom odyssey p 162 A86-17525

Helicopter fatigue - The changing scene p 165 A86-18445

The application of fatigue damage tolerance concepts to helicopters - The approach proposed by the UK military airworthiness authorities p 165 A86-18447

Intake aerodynamics p 145 A86-18450

Wide-angle, low-altitude flight simulator vision system for cockpit research and aircrew training p 180 A86-18453

Advanced technology cockpit simulator p 180 A86-18462

Lizzy - The first British liquid propellant rocket motor p 195 A86-18481

Unsteady transonic flows in an axial flow compressor p 145 A86-18529

Influence of rough runways on undercarriage design p 166 A86-19277

Natural selection in transport aircraft propulsion p 174 A86-19278

The experimental determination of the subsonic aerodynamic characteristics of an Ogive-Cylinder body including a comparison with theoretical estimates, volume 1 [CAR-8509] p 151 N86-15242

A rapid method for estimating equivalent parabolic polars from wind-tunnel tests [AD-A159559] p 153 N86-15251

Numerical solutions for three-dimensional cases: Delta wings p 155 N86-15264

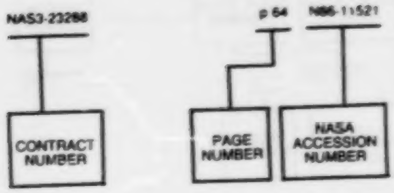
Prediction of the drag of wings at subsonic speeds by viscous/inviscid interaction techniques p 156 N86-15274

# CONTRACT NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 199)*

APRIL 1986

## Typical Contract Number Index Listing



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

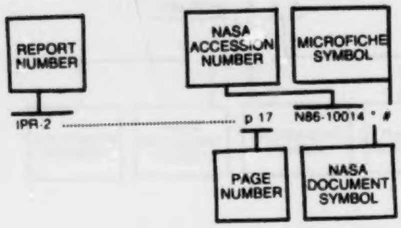
# REPORT NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 199)*

APRIL 1986

### Typical Report Number Index Listing



Listings in this index are arranged alphanumerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

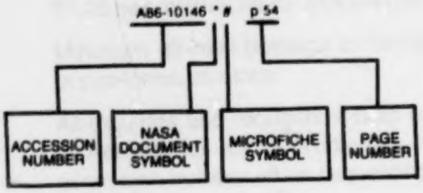
# ACCESSION NUMBER INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 199)* APRIL 1986

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche[1] of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on page vii.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

### FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

## STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-914100 at the price of $7.00 domestic and $14.00 foreign—includes annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

**A FUNDAMENTAL STUDY OF THE STICKING OF INSECT RESIDUES TO AIRCRAFT WINGS Annual Technical Report**
N. S. EISS, JR., J. P. WIGHTMAN, D. R. GILLIAM, and E. J. SIOCHI Apr. 1985 191 p refs
(Contract NAG1-300)
(NASA-CR-176231; NAS 1.26:176231) Avail: NTIS HC A09/MF A01 CSCL 01C

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

**A86-11041*#** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
**AERODYNAMIC DESIGN CONSIDERATIONS FOR EFFICIENT HIGH-LIFT SUPERSONIC WINGS**
D. S. MILLER and R. M. WOOD (NASA, Langley Research Center, Hampton, VA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-4076)

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.

This supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, price code A06.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 484 reports, journal articles, and other documents originally announced in April 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

# TABLE OF CONTENTS

Page

**Category 01 Aeronautics (General)** 197

**Category 02 Aerodynamics** 198
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03 Air Transportation and Safety** 212
Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04 Aircraft Communications and Navigation** 215
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05 Aircraft Design, Testing and Performance** 217
Includes aircraft simulation technology.

**Category 06 Aircraft Instrumentation** 228
Includes cockpit and cabin display devices; and flight instruments.

**Category 07 Aircraft Propulsion and Power** 232
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08 Aircraft Stability and Control** 237
Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09 Research and Support Facilities (Air)** 240
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10 Astronautics** 243
Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11 Chemistry and Materials** 243
Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 248
Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 259
Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** 260
Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and Computer Sciences** 262
Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 264
Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 266
Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** N.A.
Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

**Category 19 General** 267

## AERONAUTICS (GENERAL)

**A86-21055**
**AVIATION MAINTENANCE MANAGEMENT**
E. H. KING (Southern Illinois University, Carbondale, IL) Carbondale, IL, Southern Illinois University Press, 1986. 221 p. refs

The maintenance management concerns that confront the various levels of aviation supervision are discussed. The topics addressed include: the FAA's organizational structure, FAA publications pertaining to maintenance, aviation maintenance procedures, the application of aviation maintenance concepts, and budgeting, cost controls, and cost reduction. Also considered are: training and professional development in aviation maintenance, safety and maintenance, electronic data processing, and aviation maintenance management problem areas. C.D.

**A86-21325**
**GENERAL AVIATION AND REGIONAL AIR TRAFFIC - COMPONENTS OF THE TRAFFIC SYSTEM, SYMPOSIUM, FRIEDRICHSHAFEN, WEST GERMANY, MARCH 28, 29, 1985, REPORTS [DIE ALLGEMEINE LUFTFAHRT UND REGIONALLUFTVERKEHR BESTANDTEILE DES VERKEHRSSYSTEMS, SYMPOSIUM, FRIEDRICHSHAFEN, WEST GERMANY, MARCH 28, 29, 1985, VORTRAEGE]**
Symposium sponsored by DGLR, DGON, and BMFT. Bonn, Deutsche Gesellschaft fuer Luft- und Raumfahrt, 1985, 196 p. In German. No individual items are abstracted in this volume.

The airport system in the Federal Republic of Germany is considered, taking into account 11 international airports, 30 smaller airports, air traffic requirements, the importance of general aviation and regional air traffic for the economy, and the significance of smaller airlines that can provide cost-effective air transportation for regions and cities which cannot be profitably serviced by the big airliners of the large airlines. Attention is given to the role of the Lufthansa in the regional air traffic of West Germany, the regional air traffic from the point of view of the European Regional Airlines Organization (ERA), observations made in connection with regional air traffic, the effect of regional air traffic on the region in which the airport is located, observations made in an airport with respect to air traffic control, and requirements related to runways in case of instrument flight operations at regional airports. The political and economic significance of air traffic involving business aircraft is considered along with the availability of the Global Positioning System. G.R.

**A86-21894#**
**TOWARD AUTOMATED AIRFRAME ASSEMBLY**
W. H. REIMANN (USAF, Manufacturing Technology Div., Wright-Patterson AFB, OH) Aerospace America (ISSN 0740-722X), vol. 24, Jan. 1986, p. 44-46, 48.

The U.S. Air Force has been supporting research on flexible automated systems for airframe assembly over the course of several years. Attention is given to the use of two robots to inspect F-15 fighter airframe bulkheads, reducing the current 25-hr process in which 1100 measurements are conducted to a 2.5-hr one. Also noted is the robotic assembly of a microswitch from 17 parts that have been positioned randomly on a tray. Also sponsored are two programs on flexible assembly subsystems that are developing the technologies required by an Automated Assembly Center, such as flexible fixturing, part-location sensing, and temporary/permanent fastening of parts. O.C.

**A86-22128**
**EVOLUTION OF AIRCRAFT/AEROSPACE STRUCTURES AND MATERIALS SYMPOSIUM, DAYTON, OH, APRIL 24, 25, 1985, PROCEEDINGS**
Symposium sponsored by AIAA. Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, 137 p. For individual items see A86-22129 to A86-22144.

Various papers on the evolution of aircraft and aerospace structures and materials are presented. The topics addressed include: XB-70 structures and materials advances, structural evolution from B-58 to F-16, advanced composites in construction of the Beech Starship, structural and material considerations for advanced fighters, the evolution of reciprocating engines at Lycoming, aircraft design from the myth of make-do to Mach 3, and the Wright Brothers' experience in the evolution of aircraft design, structures and materials. Also considered are: evolution of the turbofan aircraft engine, X-15 high-temperature advanced structure, X-20 structures overview, ASSET program for technology development, Shuttle Orbiter airframe, airframe design to achieve minimum cost, superplastically formed-diffusion bonded titanium technology transition case study, transition of advanced materials and structures in single crystal blades, and composites technology transfer and transition. C.D.

**N86-16187*#** National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.
**VORTEX WAKE ALLEVIATION STUDIES WITH A VARIABLE TWIST WING**
G. T. HOLBROOK, D. M. DUNHAM, and G. C. GREENE Nov. 1985 117 p refs
(NASA-TP-2442; L-15870; NAS 1.60:2442) Avail: NTIS HC A06/MF A01 CSCL 01B

Vortex wake alleviation studies were conducted in a wind tunnel and a water towing tank using a multisegmented wing model which provided controlled and measured variations in span load. Fourteen model configurations are tested at a Reynolds number of one million and a lift coefficient of 0.6 in the Langley 4- by 7-Meter Tunnel and the Hydronautics Ship Model Basin water tank at Hydronautics, Inc., Laurel, Md. Detailed measurements of span load and wake velocities at one semispan downstream correlate well with each other, with inviscid predictions of span load and wake roll up, and with peak trailing-wing rolling moments measured in the far wake. Average trailing-wing rolling moments are found to be an unreliable indicator of vortex wake intensity because vortex meander does not scale between test facilities and free-air conditions. A tapered-span-load configuration, which exhibits little or no drag penalty, is shown to offer significant downstream wake alleviation to a small trailing wing. The greater downstream wake alleviation achieved with the addition of spoilers to a flapped-wing configuration is shown to result directly from the high incremental drag and turbulence associated with the spoilers and not from the span load alteration they cause. **AIR AND SPACE FLIGHT. DREAM AND FACTS [LUFT- UND RAUMFAHRT. TRAUM UND WIRKLICHKEIT]**

L. BOELKOW, K. VONGERSDORFF, and H. J. EBERT 1985 32 p In GERMAN Presented at the opening of the Air and Space Travel Hall of the Deutsches Museum, Munich, West Germany, 6 May 1984 and at Bayerischer Verdienstorden, 20 Jul. 1984

(MBB-FILM-382) Avail: NTIS HC A03/MF A01

The history of man's conquest of the air and space with hot air balloons, subsonic and hypersonic aircraft, helicopters and gliders as well as rockets, space shuttles, and manned space flights is reviewed. Progress in aircraft and space technology is discussed. Author (ESA)

**N86-16189#** Rijksluchtvaartdienst, The Hague (Netherlands).

**ACTIVITIES REPORT IN AERONAUTICS Annual Report, 1984 [JAARVERSLAG 1984]**

1984 62 p In DUTCH

Avail: NTIS HC A04/MF A01

The activities of the Dutch Civil Aeronautics Board (CAB) are reviewed. Air traffic control, airfields, air transportation, aviation security, aviation school, national aeronautics and astronautics museum, and national aeronautics and astronautics laboratory are presented. Regional services in Europe; an aviation accident law; Maastricht airport; and recognition of industries by the CAB are discussed. Author (ESA)

**N86-16190#** Societe Nationale Industrielle Aerospatiale, Suresnes (France). Lab. Central.

**PROBLEMS FOUND WHEN INTRODUCING NEW MATERIALS [PROBLEMES POSES PAR L'INTRODUCTION DES MATERIAUX NOUVEAUX]**

G. HILAIRE 29 Apr. 1985 34 p In FRENCH Presented at Journees de la Technologie 1984, Jonville, France, 5-6 Dec. 1984

(SNIAS-852-551-101; C-47-652-AC/GH-AT) Avail: NTIS HC A03/MF A01

Aircraft specifications and design problems are discussed. The parameters guiding the choice of new materials are analyzed. Organic matrix composite materials, carbon or glass, aluminum lithium alloys, titanium alloys and metallic matrix composites are examined. The effect of a new material on the aircraft life and maintenance and operation cost is discussed. Fatigue problems and lithium alloys are studied. Author (ESA)

## 02

## AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**A86-19631#**

**AN EXPERIMENTAL INVESTIGATION OF AN AIRFOIL PITCHING AT MODERATE TO HIGH RATES TO LARGE ANGLES OF ATTACK**

G. M. GRAHAM and J. H. STRICKLAND (Texas Tech University, Lubbock) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 7 p. Research supported by the Sandia National Laboratory. refs

(Contract F49620-82-C-0035)

(AIAA PAPER 86-0008)

Flow visualization data, surface pressure distributions, and load cell data were obtained from a NACA 0015 airfoil undergoing constant pitch motions over a wide range of nondimensional pitch rates. In each case, the motion began at 0 deg angle-of-attack, and terminated when the airfoil reached 90 deg angle-of-attack. It was found that lift and drag coefficient data could be correlated using simple trigonometric functions. These correlations in turn allow one to estimate lift and drag coefficients over the entire range of motion for any nondimensional pitching rate. Author

**A86-19633*#** Informatics General Corp., Palo Alto, Calif.

**UNSTEADY TRANSONICS OF A WING WITH TIP STORE**

G. P. GURUSWAMY (Informatics General Corp., Palo Alto, CA), P. M. GOORJIAN (NASA, Ames Research Center, Moffett Field, CA), and E. L. TU AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 14 p. USAF-supported research. refs

(AIAA PAPER 86-0010)

The presence of tip stores influences both the aerodynamic and the aeroelastic performance of wings. Such effects are more pronounced in the transonic regime. In this study, a theoretical method is developed, for the first time, to compute unsteady transonics of oscillating wings with tip stores. The method is based on the small-disturbance, aerodynamic equations of motion from the potential-flow theory. To validate the method, subsonic and transonic aerodynamic computations are made for a lower-aspect-ratio wing, and they are compared with the available experimental data. Comparisons are favorable. The strong effects of the tip store on the transonic aerodynamics of the wing are also illustrated. The method developed in this steady can be used for transonic, aeroelastic computations of wings with tip stores. Author

**A86-19635#**

**OSCILLATING HOT-WIRE MEASUREMENTS ABOVE AN FX63-137 AIRFOIL**

W. S. SARIC (Arizona State University, Tempe) and J. D. CROUCH AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 13 p. refs

(Contract N00014-84-K-0093; N00014-85-K-0527)

(AIAA PAPER 86-0012)

A system is developed to allow measurement of both the mean and disturbance flow velocities in separated regions. An oscillation arm assembly is developed which provides a directional bias to the hot-wire probe, along with a linear step assembly, which steps the probe through the boundary layer. A series of velocity profiles are measured on the FX63-137 airfoil in the chord Reynolds number range of 150,000 to 300,000, at angles of attack of alpha = 12 deg and alpha = 14 deg. Data are presented on the size of the separation bubble and on the location of transition to turbulence. Author

**A86-19676*#** National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.

**NUMERICAL MODELING OF ROTOR FLOWS WITH A CONSERVATIVE FORM OF THE FULL-POTENTIAL EQUATIONS**

R. C. STRAWN (NASA, Ames Research Center, Moffett Field, CA) and F. X. CARADONNA (NASA, Ames Research Center; U.S. Army, Aeroflightdynamics Directorate, Moffett Field, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs

(AIAA PAPER 86-0079)

A computer program has been developed to solve a three-dimensional conservative formulation of the full-potential equation. Its ability to solve transonic, unsteady rotor flows is demonstrated by comparison to forward flight non-lifting pressure data at low to moderate advance ratios. A 'split potential' formulation has been added to the code which incorporates known vorticity fields into the full-potential calculation. Using this methodology, rotor wake contributions have been incorporated into the computer code. Pressure results are presented for lifting rotors in hover. These results are compared to experimental data as well as to other predictions. Author

### THE COMPUTATION OF STEADY 3-D SEPARATED FLOWS OVER AERODYNAMIC BODIES AT INCIDENCE AND YAW

T. H. PULLIAM (NASA, Ames Research Center, Moffett Field, Stanford, CA) and D. PAN AIAA, Aerospace Sciences Meeting, 24th, Reno, NV. Jan. 6-9, 1986. 12 p. refs
(Contract NCA2-IR-745-404)
(AIAA PAPER 86-0109)

This paper describes the implementation of a general purpose 3-D NS code and its application to simulated 3-D separated vortical flows over aerodynamic bodies. The thin-layer Reynolds-averaged NS equations are solved by an implicit approximate factorization scheme. The pencil data structure enables the code to run on very fine grids using only limited incore memories. Solutions of a low subsonic flow over an inclined ellipsoid are compared with experimental data to validate the code. Transonic flows over a yawed elliptical wing at incidence are computed and separations occurred at different yaw angles are discussed. Author

**A86-19696#**

### INFLUENCE OF EXCITATION ON COHERENT STRUCTURES IN REATTACHING TURBULENT SHEAR LAYERS

F. W. ROOS and J. T. KEGELMAN (McDonnell Douglas Research Laboratories, St. Louis, MO) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. Research supported by McDonnell Douglas Corp. refs
(AIAA PAPER 86-0112)

A series of experiments was performed in the reattaching turbulent shear layer produced by flow over a backward-facing, two-dimensional step. Gentle excitation of the shear layer by an oscillating flap at the step lip proved to be highly effective in regularizing and enhancing the formation and development of vortical structures in the reattaching flow. Effects of variations in excitation amplitude and frequency were defined. An excitation-frequency-sensitive reduction in reattachment length was identified with the process of vortical-structure coalescence in the shear layer upstream of reattachment. Shear-layer excitation was shown to increase the intensity of reattachment-wall pressure fluctuations in all cases, regardless of the reattachment-length effect. Subharmonic phase-modulation of the shear-layer excitation was demonstrated to be effective in regularizing the vortex-merging process in the reattaching shear layer. Author

**A86-19697#**

### COMPUTATION OF DYNAMIC STALL OF NACA0012 AIRFOIL BY BLOCK PENTADIAGONAL MATRIX SCHEME

Y. SHIDA, H. TAKAMI, K. KUWAHARA (Tokyo, University, Japan), and K. ONO (Nihon University, Tokyo, Japan) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 11 p. refs
(AIAA PAPER 86-0116)

The flow field around an oscillating NACA0012 airfoil in pitch at 0.25 chord is analyzed by solving the two-dimensional compressible Navier-Stokes equations. A block pentadiagonal matrix scheme based on the approximate factorization method is adopted. Two kinds of mesh, 161 x 40 and 321 x 80, are used. In the case of coarse mesh, lift stall is captured. In the case of fine mesh, not only lift stall but also restoration process of the lift coefficient in the downstroke is captured. The process of the beginning of separation at stall stage is intensively studied. Author

**A86-19698#**

### LIFT-CURVE CHARACTERISTICS FOR AN AIRFOIL PITCHING AT CONSTANT RATE

E. J. JUMPER (USAF, Institute of Technology, Wright-Patterson AFB, OH), S. J. SCHRECK (USAF, Aeronautical Systems Div., Wright-Patterson AFB, OH), and R. L. DIMMICK AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 11 p. refs
(AIAA PAPER 86-0117)

Daley and Jumper (1984) have conducted an experimental study of dynamic stall for an airfoil pitching at constant rates. The present paper provides a report on a systematic study of the dynamic-stall event in the case of an airfoil which pitches at a constant rate. A total of 100 dynamic-stall data runs were made at five tunnel speeds in the range of flow velocities from 26 to 48 ft/s. At each tunnel speed four pitch rates were used. Attention is given to details regarding the experimental approach, the obtained results, lift-curve characteristics, preseparation characteristics, drag and moment characteristics, and general comments. It is believed that the results reported provide insight into the mechanisms at work in the dynamic-stall process. It is emphasized that different mechanisms are at work at different points in the dynamic-stall event. G.R.

### VORTICES PRODUCED BY AIR PULSE INJECTION FROM THE SURFACE OF AN OSCILLATING AIRFOIL

M. C. ROBINSON and M. W. LUTTGES (Colorado, University, Boulder) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 14 p. refs
(Contract AF-AFOSR-81-0037)
(AIAA PAPER 86-0118)

High rates of vortex production are not consistent with the airfoil oscillation rates needed to match realistic, higher Reynolds numbers. Thus, alternative mechanisms must be evolved for the control and generation of large scale vortices which can yield significant amounts of lift enhancement. The present study is concerned with a noval means for producing large scale vortices over a dynamically pitching airfoil. A pulse of air is delivered during each cycle of the sinusoidal pitch oscillation. The pulse produces a brief stream of air arising from a span oriented slot located at 0.1c parallel to the leading edge. Experiments were conducted on an NACA 0015 airfoil with six inch chord in a subsonic, low turbulence wind tunnel. Attention is given to experimental details, unsteady flow visualization, the development of pulse vortices, and hot wire anemometry of flow with and without air pulse injection. G.R.

### FLUID DYNAMICS OF CYLINDER RESPONSE TO KARMAN VORTEX SHEDDING

L. E. ERICSSON (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 11 p. refs
(AIAA PAPER 86-0119)

The fluid mechanics of cylinder response to Karman vortex shedding are composed of three district flow phenomena: (1) the vortex wake formation, (2) the coupling between flow separation and body motion, and (3) the interaction between shed vortices and the body cross-section. Analysis of available experimental results for circular and rectangular cross-section cylinders shows that, for small amplitudes, (1) is the dominating flow mechanism, and the cylinder response is of the resonant type. However, when the amplitude exceeds a few percent of the cylinder crossflow dimension, the dominating flow mechanism is (2), and the cylinder response changes from the resonant to the self-excited type typical for systems with nonlinear negative damping. Flow mechanism (3) appears only to be important if the cross-section has a suitable chordwise extent, as in the case of the rectangular cross-sections. Author

### STEADY AND UNSTEADY FULL POTENTIAL CALCULATION FOR LARGE AND SMALL ASPECT RATIO SUPERCRITICAL WINGS

S. Y. RUO, J. B. MALONE (Lockheed Georgia Co., Marietta, GA), and L. N. SANKAR (Georgia Institute of Technology, Atlanta) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 12 p. refs
(AIAA PAPER 86-0122)

A numerical method which solves the three-dimensional full-potential equation by a strongly implicit, approximate factorization algorithm is used to analyze the flow over a high and a low aspect ratio wing. Steady and unsteady flow analyses are respectively obtained by relaxation and time-accurate marching.

Numerical results are compared with the available experimental data. Author

### SUMMARY OF A HIGH SUBSONIC FORCE/PRESSURE EXPERIMENT FOR 58 DEG CAMBERED/TWISTED THICK DELTA WINGS

J. CHU and J. E. LAMAR (NASA, Langley Research Center, Hampton, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs

(AIAA PAPER 86-0169)

This paper summarizes the results of a force, moment, and pressure experiment involving six thick, cambered and twisted, delta wings with 58 deg leading-edge sweep. This experiment was conducted in the NASA Langley 7- by 10-foot High-Speed Tunnel at Mach numbers of 0.75, 0.80, and 0.83. The design goal was a configuration which was self-trimming at a lift coefficient of 0.25 and Mach number of 0.80. Although the design goal was not met, the configuration which came closest and which had the best overall performance was selected for further study. Wing surface pressure data and limited surface oil flow data for this configuration are presented to show the extent of attached flow at the design point. For selected cases, inviscid solutions from vortex lattice method/suction analogy, PAN AIR, FLO-28, and FLO-57 are compared with the experimental force, moment, and pressure data. Author

### ACOUSTIC AND TURBULENCE INFLUENCES ON STALL HYSTERESIS

J. F. MARCHMAN, III, V. SUMANTRAN, and C. G. SCHAEFER (Virginia Polytechnic Institute and State University, Blacksburg) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 11 p. refs

(Contract N0014-84-K-0093)

(AIAA PAPER 86-0170)

The results of past research on the low Reynolds number aerodynamic behavior of the Wortmann airfoil have revealed differences in data taken at different facilities. A study was conducted to determine the extent to which wind tunnel turbulence and acoustic disturbances may be responsible for differences in test results in low Reynolds number flows. Results showed that increases in turbulence can substantially reduce the well known low Reynolds number stall hysteresis effect and can even eliminate the hysteresis loop. Acoustic disturbances of the proper frequency and level can produce similar effects and may produce even more substantial alteration of test results than turbulence. Users of low Reynolds number aerodynamic data and designers of aircraft for this flight regime should be sure that the data they use has not been prejudiced by the turbulence and noise effects found in this research. ### UNSTEADY THREE-DIMENSIONAL SIMULATIONS OF A VTOL UPWASH FOUNTAIN

R. E. CHILDS and D. NIXON (Nielsen Engineering and Research, Inc., Mountain View, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 11 p. refs

(Contract F49620-85-C-0055)

(AIAA PAPER 86-0212)

Numerical simulations of a planar turbulent wall jet and a planar VTOL upwash fountain have been performed. These are three-dimensional simulations which resolve large scale unsteady motions in the flows. The wall jet simulation shows good agreement with experimental data and is presented to verify the simulation methodology. Simulation of the upwash fountain predicts elevated shear stress and a half-velocity width spreading rate of 33 percent which agrees well with experiment. Turbulence mechanisms which contribute to the enhanced spreading rate are examined. Author

### SPANWISE TURBULENCE EFFECTS ON AIRCRAFT RESPONSE

E. A. RINGNES, D. W. CAMP, and W. FROST (FWG Associates, Inc., Tullahoma, TN) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 5 p.

(AIAA PAPER 86-0255)

Turbulence across the span of a wing influences the dynamic response of an aircraft. In this paper, flight data collected with the NASA B-57B research aircraft as part of the Gust Gradient Program is utilized to investigate spanwise turbulence. The theoretical modeling is set up to calculate the aerodynamic moments and forces developed due to a distribution of turbulence. This is made possible by the three independent records of both angle of attack and airspeed from the aircraft nose and each wing tip. The magnitude of these moments and forces, called the effects of spanwise turbulence, are presented. Furthermore, as a second part of the study, the spanwise turbulence effects are incorporated into a six-degrees-of-freedom flight simulation carried out on a Pixel computer. The results from the simulation show significant influences from spanwise turbulence effects. As expected, the roll mode of the B-57B dynamic response is most strongly excited. Author

### NUMERICAL SIMULATION OF IMPINGING JETS

M. H. RIZK and S. MENON (Flow Research Co., Kent, WA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 15 p. refs

(Contract F49620-84-C-0027)

(AIAA PAPER 86-0279)

Direct numerical simulation using both the three-dimensional and two-dimensional, time-dependent Navier-Stokes equations is used to investigate V/STOL jet-induced interactions. The objective of this numerical simulation is to compute accurately the details of the flow field and to achieve a better understanding of the physics of the flow, including the role of initial turbulence in the jet, the influence of forward motion on hover aerodynamics, and the characteristics of the collision zone and the fountain. Preliminary results are presented. Author

### DESIGN OF A NATURAL LAMINAR FLOW WING FOR A TRANSONIC CORPORATE TRANSPORT

R. L. CAMPBELL, E. G. WAGGONER, and P. S. PHILLIPS (NASA, Langley Research Center, Hampton, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs

(AIAA PAPER 86-0314)

Two- and three-dimensional computational methods were used to design a wing for a transonic corporate transport that had significant runs of laminar flow on both upper and lower wing surfaces at the cruise condition. The airfoil was derived from a low-speed laminar-flow section. The contour was systematically modified based on results from a two-dimensional transonic code to give favorable pressure gradients to 50-percent chord on the upper surface and 65-percent chord on the lower surface. Three-dimensional transonic codes were used to determine the wing twist and to evaluate the aerodynamic characteristics of the complete configuration at various flight conditions. A leading-edge modification for improved stall characteristics was also designed. The theoretical pressure distributions for the final airfoil correlated well with results from wind-tunnel tests. Author

### AN EVALUATION OF LEADING-EDGE FLAP PERFORMANCE ON DELTA AND DOUBLE-DELTA WINGS AT SUPERSONIC SPEEDS

P. F. COVELL, D. S. MILLER, and R. M. WOOD (NASA, Langley Research Center, Hampton, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs
(AIAA PAPER 86-0315)

The aerodynamic performance of leading-edge flaps on three delta double-delta wing planforms having aspect ratios of 1.75, 2.11, and 2.50, have been investigated experimentally. The wings were mounted on a generic fuselage without an inlet canopy, or a vertical tail. The Mach numbers of the flow over the wings were 1.60, 1.90 and 2.16. A primary set of full-span leading-edge flaps with similar root and tip chords were tested on each wing, and several alternate flap planforms were tested on the aspect ratio 1.75 wings. It is found that all leading edge geometries were effective in reducing drag lifting over the range of wing aspect ratios and Mach numbers tested. Greater flap performance was obtained when primary flaps were applied to the delta planform. In general, the primary flap geometry yielded better performance than the alternative geometries tested. Flow visualization techniques were found to be useful for identifying the beneficial effects of leading-edge flap deflection on flow separation as well as fuselage interference effects. Black and white photographs of the delta and double-delta planforms are provided. I.H.

### SHAPING OF AIRPLANE FUSELAGES FOR MINIMUM DRAG

S. S. DODBELE, C. P. VAN DAM (Vigyan Research Associates, Inc., Hampton, VA), B. J. HOLMES (NASA, Langley Research Center, Hampton, VA), and P. M. H. W. VIJGEN AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 13 p. refs
(Contract NAG1-345; NAS1-17926)
(AIAA PAPER 86-0316)

The VSAERO surface panel method is employed to investigate fuselage shapes which can enhance the natural laminar flow (NLF) characteristics. The study is performed at cruise Re which are relevant to commuter, transport, and business aircraft. The technique is based on piecewise constant doublet and source singularities and takes into account the effects of compressibility. Inviscid pressure distributions were generated for five configurations to aid in the search for an optimized NLF body shape as a function of the transition locations and the drag coefficients. Granville's transition criteria are incorporated into the calculations to yield shapes with longer runs of laminar flow and reduced drag. In comparison with other transition prediction methods, the method described is shown to have significantly higher valicity for making three-dimensional transition predictions. M.S.K.

### INVESTIGATION OF CHORD RATIO, STAGGER, DECALAGE ANGLE, AND FLAP ANGLE FOR DUAL WING CONFIGURATIONS

B. P. SELBERG (Missouri-Rolla, University, Rolla) and G. D. VINCENT AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 11 p. refs
(Contract NAG1-26)
(AIAA PAPER 86-0317)

Aerodynamical closely coupled dual wing configurations of unequal chords are investigated for medium speed general aviation applications. Vortex panel and momentum boundary layer analysis are utilized for the two-dimensional predictions. A multi-surface vortex lattice method is used for the three-dimensional predictions. In the process of searching for the highest lift to drag ratio upper airfoil to lower airfoil chord ratios, both greater and less than one, are investigated in terms of stagger, decalage angle, and gap. With the optimum chord ratio, at the optimum stagger and gap, proper spanwise decalage distribution is shown to yield the lowest two dimensional drag results. Various wing taper ratios and wing twists are investigated to increase wing efficiency. Comparisons are made between optimized dual and optimized single wing configurations both with the same fuselage, stabilator surfaces, engines, payload, and fuel. The dual wing configuration is shown to have significantly less drag and hence longer range than the conventional single wing configuration. Author

### VISUALIZATION AND FLOW SURVEYS OF THE LEADING EDGE VORTEX STRUCTURE ON DELTA WING PLANFORMS

F. M. PAYNE, T. T. NG, R. C. NELSON (Notre Dame, University, IN), and L. B. SCHIFF (NASA, Ames Research Center, Moffett Field, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 13 p. Research supported by the University of Notre Dame. refs
(Contract NAG2-258)
(AIAA PAPER 86-0330)

In the present experimental investigation of thin delta wing vortex breakdown, for the cases of sweep angles of 70, 75, 80, and 85 deg, and smoke flow visualization/laser light sheet technique is used to obtain cross sectional views of the leading edge vortices as they break down. A combination of lateral and longitudinal cross sectional views furnishes data on the three-dimensional character of the vortex before, during, and after breakdown. Velocity measurements conducted with a laser Doppler anemometer on the 70 deg sweep delta, at 30 deg angle-of-attack, indicate that when breakdown occurs the core flow is transformed from a jet-like to a wake-like flow. O.C.

### VORTEX-AIRFOIL INTERACTION TESTS

D. D. SEATH and D. R. WILSON (Texas, University, Arlington) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 5 p.
(Contract DAAG29-84-K-0131)
(AIAA PAPER 86-0354)

Low-speed wind tunnel tests were conducted of a pressure-tapped wing model that spanned the test section and was located downstream of a half-wing model that generated a tip vortex. Tests of this perpendicular vortex-airfoil interaction showed that the vortex caused a substantial change in the pressure distribution of the downstream wing and also exhibited a spanwise drift as it passed over the wing. The [illegible] drift was in the same direction as the spanwise component of the induced flow at the wing surface, and may be attributed to an image effect, similar to the drifting apart of a wing's trailing vortices as they approach the ground. Author

### EVALUATION OF METHODS FOR PREDICTING COMPLEX AIRCRAFT FLOWFIELDS

A. CENKO (Hofstra University, Hempstead, NY) and F. TESSITORE (Grumman Aerospace Corp., Bethpage, NY) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs
(AIAA PAPER 86-0396)

Reliable methods for predicting external aircraft flowfields are required for airframe/inlet and aircraft/store integrations, as well as for predicting store trajectories. Several analytic techniques exist which, under certain conditions, can predict the flowfield of complex aircraft configurations. This paper evaluates three of these - the PAN AIR panel method, the Boppe Transonic small disturbance code, and the Grumman TFM technique - and compares them to each other as well as to experimental data and other codes. Author

### THREE-DIMENSIONAL BODY-FITTING GRID SYSTEM FOR A COMPLETE AIRCRAFT

S. J. SCHERR and J. S. SHANG (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs
(AIAA PAPER 86-0428)

A three-dimensional body-fitted grid system is generated for use in solving the Reynolds-averaged Navier-Stokes equations of the flow field about a complete aircraft. A single-block multiple-plane mesh is constructed by juxtaposition of two-dimensional cross-sections. A composite grid is used to ensure that the mesh is boundary conformal and orthogonal at the vehicle surface. The mesh singularity inherent in a body-conformal system at the nose of the vehicle is removed by use of analytic continuation and reflection properties. Author

**DEFINITION AND VERIFICATION OF A COMPLEX AIRCRAFT FOR AERODYNAMIC CALCULATIONS**

T. A. EDWARDS (NASA, Ames Research Center, Moffett Field, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs

(AIAA PAPER 86-0431)

Techniques are reviewed which are of value in CAD/CAM CFD studies of the geometries of new fighter aircraft. In order to refine the computations of the flows to take advantage of the computing power available from supercomputers, it is often necessary to interpolate the geometry of the mesh selected for the numerical analysis of the aircraft shape. Interpolating the geometry permits a higher level of detail in calculations of the flow past specific regions of a design. A microprocessor-based mathematics engine is described for fast image manipulation and rotation to verify that the interpolated geometry will correspond to the design geometry in order to ensure that the flow calculations will remain valid through the interpolation. Applications of the image manipulation system to verify geometrical representations with wire-frame and shaded-surface images are described. M.S.K.

**COMPARISON OF COMPUTATIONS AND EXPERIMENTAL DATA FOR LEADING EDGE VORTICES - EFFECTS OF YAW AND VORTEX FLAPS**

E. M. MURMAN, K. G. POWELL (MIT, Cambridge, MA), D. S. MILLER, and R. M. WOOD (NASA, Langley Research Center, Hampton, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 12 p. refs

(Contract NAG1-358)

(AIAA PAPER 86-0439)

Computations are presented using the conical Euler equations for swept delta wings with leading edge vortices. All the wings have sharp leading edges swept at 75 degrees to the freestream. In addition to an idealized flat plate model, geometrical features also included are thickness, centerbody, and two vortex flaps. Freestream Mach numbers of 1.7 to 2.8, angles of attack of 10 and 12 degrees, and angles of yaw of 0 and 8 degrees are considered. The computations are compared with pitot pressure traverses for one case. Other calculations are compared with pitot pressure traverses for one case. Other calculations are compared with surface pressure data and vapor screen pictures recently obtained at NASA Langley Research Center. The comparisons indicate that the dominant features of these flows are adequately modeled by the Euler equations, but viscous models are needed for the surface boundary layer and secondary separations. Author

**A86-19892#**

**A NUMERICAL SOLUTION OF THE DOWNWASH ASSOCIATED WITH A BLOWN-FLAP SYSTEM**

E. LOTH and B. W. MCCORMICK (Pennsylvania State University, University Park) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. refs

(Contract N62269-84-C-0437)

(AIAA PAPER 86-0473)

For blown flap aircraft, large downwashes typically occur downstream of the wing due to the high downward momentum of the lifting jet. To determine the velocities induced by the wing and jet flap circulation, a 3-D nonlinear finite element model has been developed which can predict downwash angles at any desired location. Vortex lattices positioned on the wing, flap, and thin jet sheet provide vortex filaments and control points to satisfy kinematic and dynamic boundary conditions. To simplify the mixed-boundary value problem and to reduce computer run time, the roll up of the wake in the spanwise direction has been neglected. In addition, the spanwise distribution of circulation in the wake is assumed to be elliptic in form, a reasonably fast and stable iterative method was used which allowed a self-consistent wake path to be found. Predicted downwash and lift coefficients generally agree with experimental values for various test conditions, but further improvements such as fuselage modeling would enhance the accuracy of the model. **LIFT AUGMENTATION VIA SPANWISE TIP BLOWING - A NUMERICAL STUDY**

R. E. CHILDS (Nielsen Engineering and Research, Inc., Mountain View, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 11 p. NASA-supported research.

(Contract F33615-83-C-3033)

(AIAA PAPER 86-0474)

Numerical simulations of a low aspect ratio wing with and without a spanwise directed jet issuing from the wing tip have been performed. The results show that the tip vortex is displaced outward and upward by the blowing. This gives rise to a local lift augmentation mechanism, vortex lift caused by the vortex core being above the wing, and a global mechanism, the reduction of induced velocities due to greater apparent spin. Author

**AERODYNAMIC MEASUREMENTS OF AN AIRFOIL WITH SIMULATED GLAZE ICE**

M. B. BRAGG and W. J. COIRIER (Ohio State University, Columbus) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 12 p. NASA-supported research. refs

(AIAA PAPER 86-0484)

An experimental study has been conducted in the OSU subsonic tunnel to measure the detailed aerodynamic characteristics of an airfoil with simulated glaze ice. A special model was built with interchangeable leading edges to be used in this study. One leading edge is that of a NACA 0012, while the other is a simulation of a glaze ice accretion measured in the NACA Lewis Icing Research Tunnel. The model was instrumented with a dense distribution of surface pressure taps to provide excellent detail around the ice shapes and reattachment point. A traversing total pressure probe was used to document the boundary layer characteristics on the NACA 0012 section. The ice shape caused a severe lift and drag penalty, reducing the maximum lift by over 50 percent and causing a 300 percent increase in drag. Surface pressure distributions revealed a large lower surface separation in addition to the expected large upper surface separation. Author

**CONFORMAL MAPPING AS AN AID IN GRID GENERATION FOR COMPLEX THREE-DIMENSIONAL CONFIGURATIONS**

N. D. HALSEY (Douglas Aircraft Co., Long Beach, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 11 p. Research sponsored by the McDonnell Douglas Independent Research and Development Program. refs

(AIAA PAPER 86-0497)

Conformal mapping is a very useful, but under-exploited, tool in the construction of body-fitted finite-difference (or finite-volume) grids for complex three-dimensional configurations. It has been used frequently for many two-dimensional problems and, to a lesser extent, for simple three-dimensional configurations, such as isolated wings or nacelles and wing/body combinations. This paper describes applications of conformal mapping in generating grids about three-dimensional nacelles with and without other aircraft components in close proximity. In the most complicated case considered, a grid is generated about an aft-fuselage-mounted nacelle/pylon configuration. Author

**PRACTICAL APPLICATIONS OF NEW LU-ADI SCHEME FOR THE THREE-DIMENSIONAL NAVIER-STOKES COMPUTATION OF TRANSONIC VISCOUS FLOWS**

K. FUJII (National Aerospace Laboratory, Chofu, Japan) and S. OBAYASHI (Tokyo, University, Japan) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 12 p. refs

(AIAA PAPER 86-0513)

The new LU-ADI factorization algorithm for the three-dimensional Navier-Stokes computations is developed by using the diagonally dominant LU factorization. The applications are done for a practical wing shape designed for transonic transport aircraft. Computations are carried out for several angle-of-attack cases, including the design point and the buffet limit. The computed surface pressure distributions agree with the experiment, in spite of the complicated wing geometry. The C(L)-alpha curve is plotted, with good agreement with the experiment. The computation for each case takes only about an hour and a half with the aid of a supercomputer. The preliminary computation is done for the wing-body combination, and the result is quite reasonable and promising. These results indicate the possibility of the three-dimensional Navier-Stokes code for the flow field simulations over an entire aircraft configuration. Author

**A THREE-DIMENSIONAL VISCOUS FLOW ANALYSIS FOR THE HELICOPTER TIP VORTEX GENERATION PROCESS ABOUT SQUARE AND ROUND TIPPED BLADES**

S.-J. LIN, R. LEVY, and S. J. SHAMROTH (Scientific Research Associates, Inc., Glastonbury, CT) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 14 p. Previously announced in STAR as N85-34114. refs

(Contract NAS1-14904)

(AIAA PAPER 86-0560)

The tip vortex flow field occurring in the vicinity of the tip region of a helicopter rotor blade is a very complicated three-dimensional, viscous flow phenomenon. The details of the flow in the tip region can have a major effect in determining the generated rotor noise and can significantly effect the performance and dynamic loading of the rotor blade. The three-dimensional viscous subsonic tip vortex generation processes is investigated by a numerical procedure which allows spatial forward-marching integration, utilizing flow approximations from the velocity-decomposition approach of Briley and McDonald. The approach has been applied to compute the laminar and turbulent tip vortex flows for a constant thickness slab airfoil with a square tip, a constant thickness slab airfoil with a half round tip and a NACA 0012 airfoil with a half round tip. The basic mechanism of the tip vortex generation process as well as the prediction of vortex appearance, strength and secondary flow shown by the calculations are in qualitative agreement with experimental results. Author

**VORTEX ROLL-UP FOR AN ELLIPTICALLY-LOADED WING AT MODERATELY LOW REYNOLDS NUMBERS**

H. HIGUCHI, J. C. QUADRELLI, and C. FARELL (Minnesota, University, Minneapolis) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 11 p. refs

(AIAA PAPER 86-0562)

An experimental investigation of tip-vortex roll-up was undertaken at moderately low Reynolds numbers, for an elliptically-loaded foil with a NACA 66(2)-415 section. Flow visualizations and laser Doppler velocimetry measurements were carried out to examine the flow in the vortex core and the tangential velocity distributions around the core. Separation was observed on both sides of the foil for Reynolds numbers up to 500,000. The observed changes in the location of separation and reattachment with angle of attack and Reynolds number, were adequately predicted by laminar boundary layer calculations. Axial and tangential velocity profile measurements were made at Reynolds numbers up to about 50,000. The vortex core radius was found to grow with increasing angle of attack, increasing downstream distance, and decreasing Reynolds number. A comparison of the experimentally determined velocity distributions and core sizes, with the predictions of inviscid, laminar, and turbulent vortex models, is presented. Author

**A86-19964#**

**A PREDICTIVE TECHNIQUE FOR DETERMINING STORE MOTION AFTER RELEASE FROM A CARRIER VEHICLE AT SUPERSONIC SPEEDS**

A. J. CULOTTA (Martin Marietta Corp., Orlando, FL) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 13 p. refs

(AIAA PAPER 86-0586)

A new technique has been devised for predicting the motion of a single store released from a supersonic carrier vehicle. The technique involves the simplified determination of store aerodynamics and 3-DOF motion in the carrier vehicle's flow field as modified by expansion fans and shock waves arising from open bays or surface recesses. Determination of these flow field features is assisted through flow visualization by means of low cost water table hydraulic analog. Technique verification was accomplished using M = 2, 3, and 4 grid survey and captive trajectory wind tunnel data and is applicable to both internally and conformally carried stores. Comparisons between computer predictions and experimental normal force and moment coefficients and pitch angle during separation show excellent agreement. For internally carried stores, computational results dramatically illustrate the dependence of store motion on various factors, such as, the carrier vehicle's bay pressure, strength of the carrier vehicle's bow show wave, initial ejection rates and accelerations and store aerodynamics. Technique limitations center around the means by which store aerodynamics are computed in a nonuniform flow field and the ability to define bay pressure during the separation events. This later limitation does not exist for conformally carried stores. Author

**EVALUATION OF AN AERODYNAMIC-LO[illegible] PREDICTION METHOD ON A STOL FIGHTER CONFIGURATION**

J. KATZ (NASA, Ames Research Center, Moffett Field, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 18 p. Previously announced in STAR as N86-10015. refs

(AIAA PAPER 86-0590)

A three-dimensional panel method was used to compute the aerodynamic loads on a large-scale, powered wind tunnel model. The size of the computation grid was selected such that turnaround times, on present computers remained satisfactory. With this constraint, the STOL aircraft configuration was modeled and the capabilities and limitations of the prediction method were investigated. After this study, a similar numerical model was established for a forward-swept-wing aircraft configuration which is planned for large-scale, low-speed testing. The resulting aerodynamic-load predictions are discussed and will be utilized, together with the future experimental results, to obtain a broader validation of this method as well as to reduce the necessary size of the matrix of the test parameters. **THE CRITICAL ROLE OF COMPUTATIONAL FLUID DYNAMICS IN ROTARY-WING AERODYNAMICS**
S. S. DAVIS and I.-C. CHANG (NASA, Ames Research Center, Moffett Field, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 25 p. refs
(AIAA PAPER 86-0336)

The field of helicopter rotor aerodynamics is basically the study of unsteady aerodynamic flows in a rotating and translating coordinate system. Current trends in this field are briefly reviewed by examining recent advances in lifting-surface theory, wake modeling, panel methods, and finite-difference models. Examples are used to illustrate selected current methods and some indications of promising future directions are highlighted. Author

**AIRCRAFT VISCOUS DRAG REDUCTION TECHNOLOGY**
A. S. W. THOMAS (Lockheed-Georgia Co., Marietta, GA) Lockheed Horizons, Oct. 1985, p. 22-32.

An evaluation is made of the performance improvement prospects that accrue to viscous drag reduction in subsonic aircraft through laminar flow control (LFC), with attention to the development status of the requisite technology. Major system types currently under consideration are aerodynamic section tailoring to yield sustained natural laminar flow, the use of active skin suction through small holes to laminarize turbulent boundary layers, skin cooling by cryogenic liquids such as liquid hydrogen fuel, and longitudal, triangular section skin surface microgroovings called 'riblets'. Existing aircraft are noted to be amenable to LFC efficiency improvements through the judicious addition of strakes and winglets that modify vortex flows shed (respectively) by fuselage afterbodies and wings. Novel, low turbulence aircraft configurations for future development are presented. O.C.

Methods of analyzing and experimentally measuring the effect of ice accretion on airfoil sections are presented. Empirical and analytical methods for predicting airfoil performance degradation due to ice are discussed. Ice simulation techniques for aerodynamic testing are presented and compared to data with actual ice accretions. The results show that simulation techniques to imitate the effect of ice on airfoil performance work well in most cases. Comparisons between predicted and measured airfoil performance with ice accretions are presented. For rime ice cases, the predictions compared well with experiments; but for glaze ice, a need for improved methods are seen. Author

**EULER SOLVERS AS AN ANALYSIS TOOL FOR AIRCRAFT AERODYNAMICS**
W. SCHMIDT (Dornier GmbH, Friedrichshafen, West Germany) and A. JAMESON (Princeton University, NJ) IN: Advances in computational transonics . Swansea, Wales, Pineridge Press, 1985, p. 371-404. refs

The present chapter is concerned with numerical techniques for solving hyperbolic systems of partial differential equations, taking into account the solution of the Euler equations. It is pointed out, however, that the presented algorithms have been successfully applied also to the Navier Stokes equations. The governing set of differential equations is discussed, giving attention to time-dependent Euler equations, transformed equations, the finite volume approach, and relations at discontinuities. Aspects of numerical discretization are also explored. Central space approximations are considered along with dissipative terms, time stepping schemes, boundary conditions, and Kutta conditions for lifting flows. Other topics studied are related to convergence acceleration, two-dimensional flows, and three-dimensional flows. G.R.

Numerical simulation studies of problems in transonic flow are conducted in connection with the design of aircraft flying near the speed of sound, while recently there has also been a great deal of interest in supersonic and hypersonic flow calculations. Three important models for inviscid compressible gasdynamics are utilized in the study of these flow problems, taking into account the transonic small disturbance equation (TSD), the transonic full potential equation (FP), and the full Euler equations for compressible gasdynamics (EU). The present paper has the objective to provide a description of shock capturing methods recently developed for each model. The design principles behind the algorithms are also examined, giving attention to consistency, conservative form, monotone and sharp discrete shocks, and a bound on the variation, which prevents spurious oscillations. G.R.

F. T. JOHNSON, J. E. BUSSOLETTI, A. C. WOO (Boeing Military Airplane Co., Seattle, WA), and D. P. YOUNG (Boeing Computer Services Co., Tukwila, WA) IN: Advances in computational transonics . Swansea, Wales, Pineridge Press, 1985, p. 835-874. refs
(Contract NAS2-9830)

In this chapter, a description is given of a nonstandard method which has the ultimate goal to provide a routine solution of transonic flow problems about large, complex configurations. For a number of reasons, it is difficult to extend standard methods to the solution of flows about complicated configurations. According to the particular approach of the considered nonstandard method, in the process of solving for linear potential flow via panel methods, a flow everwhere in space is created, taking into account the interior of the aircraft as well as the external flowfield of interest. Attention is given to the solution of flow problems without interior boundaries, the treatment of interior boundaries, and areas of current and future research. G.R.

**THE NUMERICAL SOLUTION OF THE COMPRESSIBLE VISCOUS FLOW FIELD ABOUT A COMPLETE AIRCRAFT IN FLIGHT**

R. W. MACCORMACK (Washington, University, Seattle) IN: Computational methods in viscous flows . Swansea, Wales, Pineridge Press, 1984, p. 225-254. refs
(Contract AF-AFOSR-83-0057)

Estimates made by Chapman (1979) of the number of mesh points and computer memory required to calculate the viscous flow field about a complete aircraft at flight Reynolds number are reviewed, and it is noted that the required computer capability will become available in the near future The problems associated with the fitting of a mesh around an aircraft and the numerical procedures required for such a flow calculation are examined. It is argued that the Reynolds-averaged Navier-Stokes equations can be solved about a complete aircraft at cruise conditions with the coming computer resources with the same degree of accuracy and cost as present high Reynolds number calculations for flow past relatively simple aerodynamic shapes. **TRANSONIC BLADE TO BLADE CALCULATIONS IN AN AXIAL, RADIAL OR MIXED FLOW CASCADE EQUIPPED WITH SPLITTER BLADES**

F. BERTHEAU (DRET, Paris, France), Y. RIBAUD (ONERA, Chatillon-sous-Bagneux and Palaiseau, France), and V. MILLOUR (ONERA, Chatillon-sous-Bagneux, France) ASME, International Gas Turbine Conferences and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 7 p. DRET-supported research. refs
(ASME PAPER 85-GT-86; ONERA, TP NO. 1985-23)

A general computer code for pseudo-unsteady Euler equations integration in turbomachinery cascades has been developed. A quasi-three-dimensional flow hypothesis is assumed and only blade to blade calculation is considered here. Cascades may be axial, radial or mixed flow type. First the computerized quasi-orthogonal network is shown. This network takes into account splitters and is designed to reduce the computation time. Then, the numerical method is described and the major difficulties of this problem, which are boundary conditions, leading edge and trailing edge treatments, are presented. Finally, examples of calculations on turbines and compressors are given with emphasis on graphic representation. Author

**PRODUCTION AND DEVELOPMENT OF SECONDARY FLOWS AND LOSSES WITHIN A THREE DIMENSIONAL TURBINE STATOR CASCADE**

A. YAMAMOTO and R. YANAGI (National Aerospace Laboratory, Chofu, Japan) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 9 p. Research supported by the Ministry of International Trade and Industry. refs
(ASME PAPER 85-GT-217)

Using five-hole pitot tubes, detailed flow measurements were made before, within and after a low-speed three-dimensional turbine stator blade row to obtain quantitative information on the aerodynamic loss mechanism. Qualitative flow visualization tests and endwall static pressure measurements were also made. An analysis of the tests revealed that many vortical flows promote loss generation. Within a large part of the cascade, a major loss process could be explained simply as the migration of boundary layer low energy fluids from surrounding walls (endwalls and blade surfaces) to the blade suction surface near the trailing edge. On the other hand, complexity exists after the cascade and in the vortical flows near the trailing edge. The strong trailing shedding vortices affect upstream flow fields within the cascade. Detailed flow surveys within the cascade under the effects of blade tip leakage flows are also included. Author

**AN ELEVEN PARAMETER AXIAL TURBINE AIRFOIL GEOMETRY MODEL**

L. J. PRITCHARD (Williams International, Walled Lake, MI) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 12 p. refs
(ASME PAPER 85-GT-219)

The mathematical derivation, and FORTRAN code, of a comprehensive but easy to use geometry model for axial flow turbine nozzles and rotors is presented. To uniquely define an airfoil on a cylinder the aerodynamicist need only specify the number of blades, and at each radius of interest: the axial and tangential chord, throat, uncovered turning, leading and trailing edge radii, inlet and exit blade angles, and inlet wedge angle. Default values exist for six of these geometric variables, which proves useful when starting a design. Both the suction and the pressure surfaces are described entirely by analytical functions. Sample airfoils are included that demonstrate the effect of each parameter upon blade shape. Author

**CALCULATION OF EXTERNAL AND INTERNAL TRANSONIC FLOW FIELD OF A THREE-DIMENSIONAL SHIELDED S-SHAPED INLET**

H. SHEN, S. LUO, M. JI, Z. XING, X. ZHU et al. Northwestern Polytechnical University, Journal, vol. 3, Oct. 1985, p. 447-458. In Chinese, with abstract in English. refs

Internal and external three-dimensional transonic flow fields of shield s-shaped inlets are calculated, including the forebody, at different angles of attack and yaw angles. An improved analytical continuation method is developed to treat the boundary condition at the solid surface. When the geometry of objects is complex, the whole computation region is divided into three parts and different physical coordinate systems are applied to each part. Data for the interfaces of neighboring parts are transferred using interpolation formulas, and good convergence and calculational stability are achieved. Sample computations of two s-shaped inlets are performed using the present method, and the results are compared with those obtained by the perturbation method and with experimental results. The comparison indicates that the present method is promising. C.D.

**A VORTEX LATTICE METHOD FOR JET WING PERFORMANCE WITH NONLINEAR WAKE AND TIP FLOW**

Z. CHEN (Beijing Institute of Aerodynamics, People's Republic of China) and J. M. WU (Tennessee, University, Tullahoma) Acta Aeronautica et Astronautica Sinica, vol. 6, Aug. 1985, p. 329-334. In Chinese, with abstract in English. refs

A three-dimensional nonlinear method for determining the aerodynamic performance of a jet flap wing has been developed. The method utilizes a system of bound and free vortices with vortex lattices to represent the wing, jet wake, and tip vortices. This method satisfies both kinematic and dynamic conditions, and takes vortex interaction into consideration. The solutions obtained include chordwise and spanwise load distributions, from which sectional and total aerodynamic qwantities are derived. The jet-wake sheet and the tip vortex shape are determined simultaneously, taking nonlinear effects into account. The solutions agree with other analytical results and available data for a jet wing with large aspect ratio. The method is applicable to cases with large jet blowing angles as well. C.D.

**SIMULATION OF DIFFUSER DUCT FLOWFIELDS USING A THREE-DIMENSIONAL EULER/NAVIER-STOKES ALGORITHM**

J. VADYAK (Lockheed-Georgia Co., Marietta, GA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 15 p. Research sponsored by the Lockheed Independent Research and Development Program. refs
(AIAA PAPER 86-0310)

An analysis is presented for calculating steady (or unsteady) three-dimensional aircraft diffuser duct (or thrust nozzle) flowfields. This algorithm can compute the flowfield in axisymmetric or arbitrary asymmetric diffuser duct configurations at subsonic, transonic, or supersonic speeds. The algorithm can solve either the Euler momentum equations for inviscid flow, the thin-shear-layer Navier-Stokes equations for viscous flow, or the full Navier-Stokes equations for viscous flow. The flowfield is determined on a body-fitted numerically-generated computational grid. A fully-implicit alternating-direction-implicit algorithm is employed for solution of the finite-difference equations. Numerical results and correlations with experiment are presented to illustrate application of the analysis. Author

**VELOCITY AND TEMPERATURE DECAY CHARACTERISTICS OF INVERTED-PROFILE JETS**

U. VON GLAHN, J. GOODYKOONTZ, and C. WASSERBAUER (NASA, Lewis Research Center, Cleveland, OH) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 31 p. Previously announced in STAR as N86-14223. refs
(AIAA PAPER 86-0312)

In order to design efficient, lightweight flap systems for future engine under-the-wing STOL aircraft, the velocity and temperature decay rate of the jet plume must be increased relative to that for single-stream nozzles in order to provide local flap loads and structural temperatures within acceptable limits. The jet plume decay rate of dual flow engines can be increased by resorting to inverted-profile velocity and temperature nozzle concepts. The peak axial decay characteristics of model-scale, two-stream inverted-profile nozzle flows are empirically correlated. Also discussed are the radial and spreading characteristics of inverted-profile nozzle flows. Author

**NUMERICAL ISSUES IN COMPUTING INVISCID SUPERSONIC FLOW OVER CONICAL DELTA WINGS**

S. R. CHAKRAVARTHY and D. K. OTA (Rockwell International Science Center, Thousand Oaks, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 20 p. refs
(AIAA PAPER 86-0440)

For a thin elliptic cone with half angles 20 degrees and 1.5 degrees, recent numerical results obtained with various methods based on central difference approximations show a distinct difference between solutions obtained on 'fine' and 'coarse' grids. The study reported in this paper began by using methods based on state-of-the-art high-resolution upwind-biased Total Variation Diminishing (TVD) formulations to study the same problem. These techniques resulted in consistent solutions on 'fine', 'coarse', and 'very coarse' grids. A systematic study of the differences between methods based on central and upwind discretizations was then initiated to see if they contributed to the distinct types of solutions obtained with them. After an extensive study, a surprising conclusion emerged: the anomalous behavior of the solutions obtained using central difference approximations need not be due to any fundamental difference between these and upwind schemes, but can be purely a result of using spatially varying time steps. In fact, it is shown in this paper, that such solutions can be obtained with upwind-biased approximations also by using spatially varying time steps. Author

**A86-22702#**

**INFLUENCE OF WING TIP CONFIGURATION ON LATERAL BLOWING EFFICIENCY**

D. TAVELLA, C. S. LEE, and N. J. WOOD (Stanford University, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 5 p. refs
(AIAA PAPER 86-0475)

An experimental investigation of the effect of slot position and orientation on the aerodynamic characteristics of the lateral wing tip blowing concept was conducted. It was found that displacing the slot closer to the upper surface of the wing enhances the lift augmentation. The same happens when the slot is slanted downward. The first effect is primarily viscous, while the second appears to have also an inviscid character. Both effects manifest themselves as distributed increments of lift along the wing span, above the lift augmentation that would be produced by a symmetrically located slot. It is concluded that the offset slot affects the wing aerodynamics through changes in the jet extension into the free stream, rather than through suction forces due to differential entrainment by the two sides of the jet. The effect of jet slant is in qualitative agreement with theoretical predictions. Author

**NUMERICAL SIMULATION OF TRANSONIC SEPARATED FLOWS OVER LOW-ASPECT RATIO WINGS**

U. KAYNAK (Informatics General Corp., Palo Alto, CA), T. L. HOLST, R. L. SORENSON (NASA, Ames Research Center, Moffett Field, CA), and B. J. CANTWELL (Stanford University, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 15 p. refs
(Contract NCA2-OR-745-309)
(AIAA PAPER 86-0508)

Transonic flow fields about a low-aspect-ratio advanced technology wing have been computed using a viscous/inviscid zonal approach. The flow field near the wing where viscous effects are important was solved using the 'Reynolds-Averaged Navier-Stokes Equations' in 'thin-layer' form. The Euler equations were used to determine the flow field in regions away from the wing where viscous effects are insignificant. A zonal grid using an H-H topology was generated around the wing by first solving a set of Poisson's equations for the global grid. This grid was then subdivided into separate zones of viscous or inviscid flow as suggested by the flow physics. A series of flow cases were computed and compared with corresponding sets of experimental data. All cases showed good agreement with experiment in terms of the pressure field. Also, a good correlation between computed separated surface flow and experimental oil flow was obtained. Author

**A FORTRAN PROGRAM FOR THE DETERMINATION OF UNSTEADY AIRFORCES ON GENERAL COMBINATIONS OF INTERFERING LIFTING SURFACES OSCILLATING IN SUBSONIC FLOW**

W. WALDMAN 1985 92 p refs
(ARL-STRUCT-R-412; AR-003-987) Avail: NTIS HC A05/MF A01

The aeroelastic stability of an aircraft is an important consideration in the overall process of determining its airworthiness. When external bodies or stores are added to the wing of an aircraft, the dynamic characteristics of the aircraft will be changed.

Due to the inertial, elastic and aerodynamic coupling between the wing and its stores the flutter speed of the aircraft may be adversely affected. The aerodynamic coupling may be particularly important if the stores have aerodynamic surfaces, such as fins, that can generate large oscillatory aerodynamic forces. There are a number of computer programs which predict unsteady aerodynamic forces acting on oscillating lifting surfaces. These programs, which are based on the doublet lattice method of Albano and Rodden were optimized for simple interfering wing-tail-fin and control surface cases. They are not applicable to general combinations of interfering lifting surfaces. Thus a requirement exists for a computer program that can calculate unsteady aerodynamic forces for general configurations of interfering lifting surfaces, including a capability for dealing with store aerodynamics. Since the doublet lattice method is readily applicable to interfering and nonplanar lifting surfaces, it is used as the basis of a program capable of dealing with general configurations. The doublet lattice method is versatile and there are essentially no restrictions on the configurations that can be handled as long as an appropriate idealization can be developed. G.L.C.

### AERODYNAMIC CHARACTERISTICS OF A HIGH-WING TRANSPORT CONFIGURATION WITH A OVER-THE-WING NACELLE-PYLON ARRANGEMENT

W. P. HENDERSON and W. K. ABEYOUNIS Dec. 1985 93 p refs
(NASA-TP-2497; L-15959; NAS 1.60:2497) Avail: NTIS HC A05/MF A01 CSCL 01A

An investigation has been conducted in the Langley 16-Foot Transonic Tunnel to determine the effects on the aerodynamic characteristics of a high-wing transport configuration of installing an over-the-wing nacelle-pylon arrangement. The tests are conducted at Mach numbers from 0.70 to 0.82 and at angles of attack from -2 deg to 4 deg. The configurational variables under study include symmetrical and contoured nacelles and pylons, pylon size, and wing leading-edge extensions. The symmetrical nacelles and pylons reduce the lift coefficient, increase the drag coefficient, and cause a nose-up pitching-moment coefficient. The contoured nacelles significantly reduce the interference drag, though it is still excessive. Increasing the pylon size reduces the drag, whereas adding wing leading-edge extension does not affect the aerodynamic characteristics significantly. Author

### VALIDATION OF VISCOUS AND INVISCID COMPUTATIONAL METHODS FOR TURBOMACHINERY COMPONENTS

L. A. POVINELLI 1986 19 p refs Proposed for presentation at the 31st International Gas Turbine Conference, Dusseldorf, West Germany; sponsored by ASME
(NASA-TM-87193; E-2765; NAS 1.15:87193) Avail: NTIS HC A02/MF A01 CSCL 01A

An assessment of several three-dimensional computer codes used at the NASA Lewis Research Center is presented. Four flow situations are examined, for which both experimental data and computational results are available. The four flows form a basis for the evaluation of the computational procedures. It is concluded that transonic rotor flow at peak efficiency conditions may be calculated with a reasonable degree of accuracy, whereas, off-design conditions are not accurately determined. Duct flows and turbine cascade flows may also be computed with reasonable accuracy whereas radial inflow turbine flow remains a challenging problem. Author

### FLOW FIELD SURVEY NEAR THE ROTATIONAL PLANE OF AN ADVANCED DESIGN PROPELLER ON A JETSTAR AIRPLANE

K. R. WALSH 1985 29 p refs
(NASA-TM-86037; H-1226; NAS 1.15:86037) Avail: NTIS HC A03/MF A01 CSCL 01A

An investigation was conducted to obtain upper fuselage surface static pressures and boundary layer velocity profiles below the centerline of an advanced design propeller. This investigation documents the upper fuselage velocity flow field in support of the in-flight acoustic tests conducted on a JetStar airplane. Initial results of the boundary layer survey show evidence of an unusual flow disturbance, which is attributed to the two windshield wiper assemblies on the aircraft. The assemblies were removed, eliminating the disturbances from the flow field. This report presents boundary layer velocity profiles at altitudes of 6096 and 9144 m (20,000 and 30,000 ft) and Mach numbers from 0.6 to 0.8, and it investigated the effects of windshield wiper assemblies on these profiles. Because of the unconventional velocity profiles that were obtained with the assemblies mounted, classical boundary layer parameters, such as momentum and displacement thicknesses, are not presented. The effects of flight test variables (Mach number and angles of attack and sideslip) and an advanced design propeller on boundary layer profiles - with the wiper assemblies mounted and removed - are presented. Author

**PRESSURE DISTRIBUTIONS FROM HIGH REYNOLDS NUMBER TESTS OF A BOEING BAC 1 AIRFOIL IN THE LANGLEY 0.3-METER TRANSONIC CRYOGENIC TUNNEL**

W. G. JOHNSON, JR. and A. S. HILL Dec. 1985 271 p refs
(NASA-TM-87600; L-16010; NAS 1.15:87600) Avail: NTIS HC A12/MF A01 CSCL 01A

A wind-tunnel investigation designed to test a Boeing advanced-technology airfoil from low to flight-equivalent Reynolds numbers has been completed in the Langley 0.3-Meter Transonic Cryogenic Tunnel. This investigation represents the first in a series of NASA/U.S. industry two-dimensional airfoil studies to be completed in the Advanced Technology Airfoil Test program. Test temperature was varied from ambient to about 100 K at pressures ranging from about 1.2 to 6.0 atm. Mach number was varied from about 0.40 to 0.80. These variables provided a Reynolds number (based on airfoil chord) range from 4.4 X 10 to the 6th power to 50.0 X 10 to the 6th power. All the test objectives were met. The pressure data are presented without analysis in plotted and tabulated formats for use in conjunction with the aerodynamic coefficient data published as NASA TM-81922. At the time of the test, these pressure data were considered proprietary and have only recently been made available by Boeing for general release. Data are included which demonstrate the effects of fixed transition. Also included are remarks on the model design, the model structural integrity, and the overall test experience. Author

**SIX DEGREE OF FREEDOM SIMULATION OF FLUID PAYLOAD PROJECTILES USING NUMERICALLY COMPUTED FLUID MOMENTS**

H. R. VAUGHN, W. P. WOLF, and W. L. OBERKAMPF Jul. 1985 102 p
(Contract DE-AC04-76DP-00789)
(DE85-017183; SAND-85-1166) Avail: NTIS HC A06/MF A01

A flight trajectory simulation method has been developed for calculating a six degree of freedom motion of fluid filled projectiles. Numerically calculated internal fluid moments and experimentally known aerodynamic forces and moments are coupled to the projectile motion. Comparisons of predicted results with flight test data of an M483 155mm artillery projectile with a highly viscous payload confirm the accuracy of the simulation. This simulation clearly shows that the flight instability is due to the growth of the nutation component of angular motion caused by the viscous effects of the fluid payload. This simulation procedure, when used in conjunction with the previously developed method for calculating internal fluid moments, allows the designer to examine the effects of various liquid payloads and container geometries on the dynamic behavior of flight vehicles. **IMPLICIT FINITE-DIFFERENCE METHODS FOR THE CALCULATION OF UNSTEADY TRANSONIC POTENTIAL FLOW AROUND TWO-DIMENSIONAL AIRFOILS: A DISCUSSION**

J. VANDERVOOREN and H. SCHIPPERS 23 Sep. 1985 33 p refs Submitted for publication
(NLR-MP-83063-U; B8566372) Avail: NTIS HC A03/MF A01

Mathematical modeling of unsteady transonic flow is discussed. Starting from the Euler equations, potential theory is derived and applied to the flow about a 2D airfoil. Motions considered include rigid body motions and deformations of the airfoil. The full-potential equation is formulated on curvilinear coordinates maintaining strong conservation form. Boundary conditions on the airfoil, wake conditions and radiation type far-field conditions are assessed. A numerical method based on time-linearization of the differential equation up to second order accuracy is presented. The resulting equation can be integrated numerically by an implicit locally one-dimensional split method. Approximation of spatial derivatives by fully conservative finite difference schemes employing mass-flux splitting for the capture of shocks is treated. Results for the steady flow about an airfoil illustrate that an Engquist-Osher type scheme at the sonic line is a prerequisite to rigorously suppress nonphysical expansion shocks. Author (ESA)

**AN EXPERIMENTAL INVESTIGATION OF THE ENTRAINMENT INTO A LEADING-EDGE VORTEX**

N. G. VERHAAGEN and L. VANDERSNOEK 1984 60 p refs
(VTH-LR-332) Avail: NTIS HC A04/MF A01

The theoretical distribution of the velocity inside the rotational core of a leading-edge is derived using Stewartson and Hall's (1963) outer solution for the rotational core. From it the entrainment into and the circulation around the rotational core is derived. The theoretical results are compared with results from measurements on the leading-edge vortex of a sharp-edged unit aspect ratio delta wing. The measurements were performed for an angle of attack of 20 deg at 45 m/sec, corresponding to a Reynolds number of 2.5 million, based on centerline chord. A relation for the entrainment factor found in the literature is shown to be incorrect. Author (ESA)

**APPLICATION OF TIME-LINEARIZED METHODS OF OSCILLATING WINGS IN TRANSONIC FLOW AND FLUTTER**

M. H. L. HOUNJET and J. J. MEIJER 15 Aug. 1984 21 p refs Presented at AGARD Specialists Meeting on Unsteady Aerodynamics and Aeroelastic Applications, Toulouse, France, 2-7 Sep. 1984 Sponsored by Royal Netherlands Air Force, The Hague
(NLR-MP-84077-U; B8569322) Avail: NTIS HC A02/MF A01

Unsteady aerodynamic loads in the transonic domain were obtained with time-linearized methods in which a so-called field panel method which accounts for a proper radiation of signals towards infinity is embedded. The methods are used to predict the unsteady loads and first harmonic pressure distributions on an airfoil and a transport type wing. Results are correlated with data of unsteady experiments and of other calculation methods. Transonic flutter applications to a fighter-type configuration are described. Author (ESA)

**CALCULATIONS OF TRANSONIC FLOWS AROUND SINGLE AND MULTIELEMENT AIRFOILS ON A SMALL COMPUTER**

Z. NOWAK 1984 32 p refs Sponsored by Netherlands Organization for the Advancement of Pure Research
(REPT-84-48) Avail: NTIS HC A03/MF A01

A method based on finite volume discretization of the full potential equation with artificial compressibility for calculating transonic flows around single and multielement airfoils is presented. The velocity potential is calculated on a succession of grids by the line-Newton method. For multielement airfoils, the channels between the component parts are treated with the line-Newton relaxation or underrelaxation procedure. The method is quite efficient for relatively coarse grids (size 21 x 64 or 17 x 64). For finer grids convergence could be improved by multigrid methods. A method for generating nearly orthogonal grids in double-connected regions using simple semianalytic formulas is given. The grids are strictly orthogonal at the inner boundary. Author (ESA)

Steady and unsteady forces acting on a circular cylinder, a square-section cylinder and an H-profile (Tacoma Bridge) were investigated in a pressurized wind tunnel (very high Reynolds numbers). The forces were measured by a piezo-multicomponent balance, which features a large dynamic range, low interference and a high natural frequency. The Reynolds number (Re) range between 20,000 and 7 million is investigated with the same circular cylinder and balance by merely varying flow velocity and air density. In the critical Reynolds number range, bistable asymmetric flow states which can be controlled by a very small perturbation are observed. The investigation of the square section reveals no strong Reynolds number effects in the range Re between 100,000 and 4 million. The Tacoma profile is shown to be aeroelastically unstable in torsion mode. Author (ESA)

**NUMERICAL SIMULATION OF THE LEADING-EDGE SEPARATION VORTEX OVER DELTA WING**
K. FUJII *In its* Proceedings of the 2nd NAL Symposium on Aircraft Computational Aerodynamics p 27-34 1984 refs In JAPANESE; ENGLISH summary
Avail: NTIS HC A14/MF A01

A thin-layer Navier-Stokes code capable of predicting steady state viscous flows is applied to complicated three-dimensional flow fields. The code is written in a generalized coordinate system, and a recently developed grid generation procedure is used for the flow-field discretization. Application is made to the vortical flow over a delta wing at high angle of attack, and the computed results are compared with experimental results. The results indicate that the present method can capture the physical phenomenon well. It is served that a leading-edge separation vortex is formed over the wing, as is a secondary separation vortex near the leading edge. The flow field behind the trailing edge is also well described. S. OGAWA and T. ISHIGURO *In its* Proceedings of the 2nd NAL Symposium on Aircraft Computational Aerodynamics p 43-52 1984 refs In JAPANESE; ENGLISH summary
Avail: NTIS HC A14/MF A01

A numerical procedure for solving the flow field generated by a moving body is presented based on a finite difference solution of Navier-Stokes equations. A conservation-law form of the equations in a general time-varying coordinate system is derived from the Cartesian expression by applying the concept of Lie derivatives. Specifically, a moving coordinate expression of the streamfunction-vorticity formulation is derived, and is used for the analysis of the dynamic-stall phenomenon of an oscillating airfoil in incompressible flow. A computation example is given for an NACA 0012 airfoil oscillating in pitch at an amplitude of 10 deg about a mean angle of attack of 15 deg with a reduced frequency of 0.4 pi and a Reynolds number of 20,000 based on the chord length and the uniform advance speed of the airfoil. Avail: NTIS HC A14/MF A01

As a preliminary investigation into the relationship between the transonic flutter characteristics and the shock behavior of a transonic cascade, a numerical analysis using a finite-difference method was carried out for a cascade oscillating in pitch about its midchord anti-phase with each other and a zero stagger angle, based on an assumption of inviscid flow. The computational method was examined by comparisons of computational results with experimental results of the shock wave periodic movements due to oscillation of the cascade, unsteady surface pressure and aerodynamic instability. Although quantitative differences in both results exists, which were caused by the presence of shock-boundary interaction in real phenomenon, the present computation was useful in the investigation of qualitative aspects of the shock wave behavior, aerodynamic instability and the relations between them. In such computation, it is necessary to make the computational mesh size small in comparison to the displacement of the shock wave. Author

**INVESTIGATIONS ON EFFICIENT NUMERICAL METHOD FOR SUBSONIC LIFTING SURFACES**
S. ANDO *In its* Proceedings of the 2nd NAL Symposium on Aircraft Computational Aerodynamics p 149-162 1984 refs In JAPANESE; ENGLISH summary
Avail: NTIS HC A14/MF A01

This is an intermediate summary report on the numerical investigation of subsonic unsteady lifting surface. This work describes simple planar cases. Most of the results thus obtained would be fundamentally useful even for more complicated problems, such as non-planar wings or wings with finite thickness. The results are divided into the following three main parts: (1) introduction of error-index parameters E, and development of an adaptive numerical method for lifting surfaces. (2) Improvement of numerical calculation of the subsonic kernel function. (3) Development of new, accurate, fast-converging numerical methods for lifting surfaces. For two-dimensional airfoils a DLM-C method has been developed. For finite span wings a finite aerodynamic element method (DSM-CLS) and two pressure mode methods (NAM, NAS) have been developed. An approximate factorization scheme has been developed for analyzing transonic flows past an airfoil. In this scheme, upwind differencing is used for introducing artificial viscosity in the supersonic region and central differencing is used in the subsonic region. The resulting simple two- and three-banded matrices are solved by the relaxation procedure. This scheme is fully implicit, and in principle can be combined with the solution adaptive method. In both sub- and super-critical cases, the computed surface pressure distributions for an NACA0012 airfoil are in good agreement with those obtained by other methods. Author

An unconditionally stable explicit method has been applied to compute compressible laminar flows past an NACA0012 airfoil. The method is based on a combination of central differencing for spatial derivatives with a rational Runge-Kutta time integration scheme. Both transonic (M = 0.8) and supersonic (M = 2.0) flow cases have been calculated for various Reynolds numbers. Physically plausible results are obtained for each case within practically feasible CPU time. Author

K. ONO *In* National Aerospace Lab. Proceedings of the 2nd NAL Symposium on Aircraft Computational Aerodynamics p 213-220 1984 refs In JAPANESE; ENGLISH summary
Avail: NTIS HC A14/MF A01

The results of numerical computations on the dynamic stall process of a two dimensional NACA0012 airfoil oscillating in pitch between 0 deg and 20 deg incidence angles are summarized. The uniform flow Mach number is set to 0.3. The Beam-Warming finite difference algorithm is applied to solve the time-averaged compressible Navier-Stokes, the laminar compressible Navier-Stokes and the Euler equations. The grid system is constructed based on a body-fitted curvilinear coordinate system for efficient unsteady flow computations. The computational results are compared with the experimental data. The process of the formation of the leading edge separation bubble, its convection along the airfoil surface and its shedding into the wake is fairly well simulated. But the abrupt drop of the lift coefficient is not detected in the computations. Judging from the pressure coefficient distribution, the Euler equations results give the best agreement with the experiment. It suggests that the effective local Reynolds number in the turbulent calculation is smaller than that in the actual flow field. A more precise estimation of the turbulence viscosity, the artificial one and the truncation error is necessary. Author

Y. Y. WANG and T. FUJIWARA *In* National Aerospace Lab. Proceedings of the 2nd NAL Symposium on Aircraft Computational Aerodynamics p 221-228 1984 refs In JAPANESE; ENGLISH summary
Avail: NTIS HC A14/MF A01

An effective finite-difference scheme for solving full compressible Navier-Stokes equations was initiated by Beam and Warming. The purpose of this paper is to develop that technique and apply it to the calculation of a typical subsonic or transonic, inviscid or viscous steady flow. First, the strong conservation-law form of the Navier-Stokes equations is written in Cartesian coordinates, and then transformed into a general grid system. Following the Beam-Warming difference scheme, the parameter combination delta=1/2 and theta=1 is generally adopted. After introducing spatial factorization, second-order dissipative terms are added to the left-hand side, while fourth-order terms are added to the right-hand side; the fourth-order smoothing terms are changed to second-order terms at points adjacent to the boundaries. The numerical computations were carried out only for a typical NACA 0012 airfoil. The calculations start from uniform free-stream variables throughout the flow field. The boundary conditions in the far field are free-stream. The following four cases are calculated: (1) M sub infinity = 0.63 and alpha=0, causing an entirely subsonic flow, (2) M sub infinity = 0.63 and alpha=2 degrees, the highest velocity of upper surface being close to sonic; (3) M sub infinity = 0.75 and alpha=0, when supersonic regions appear but there are no shock waves, and (4) M sub infinity = 0.75 and alpha=2 degrees, generating a shock wave over the upper flow field. High Reynolds number transonic flow around an airfoil is numerically analyzed. The implicit approximate factorization scheme is used for the Navier-Stokes equations with an algebraic eddy viscosity model of the turbulent boundary layer. The boundary conditions on the airfoil and along the wake cut are implicitly handled. Computed results of short bubble and shock-induced separation are demonstrated. Inviscid transonic flow around and airfoil is also numerically analyzed. The diagonal form of the implicit approximate factorization scheme is used for computational efficiency. Some of the results are compared with those of potential flow calculations. Author

Avail: NTIS HC A14/MF A01

Over the past decade, the progress in computational aerodynamics has been so tremendous that it can be said that designers in aircraft industries have obtained a tool for aerodynamics analysis other than wind tunnel test, which had been their only tool since the invention of the aircraft. The new technology has become an even more efficient design tool with the development of computer aided design systems for interactive processing. All of the practical aerodynamics codes, however, are inviscid or boundary-layer-corrected programs which are accurate enough for analyzing attached flows but not for separated flows. Severe design trade off for recent high performance aircraft has necessitated accurate numerical analysis of viscous separated flows. The high Reynolds number transonic airfoil analysis code NSFOIL, is expected to be a good candidate for this difficult task. This paper presents the NSFOIL computation of the transonic flow past a supercritical airfoil, along with a comparison with the experiment to show the effectiveness of the new code. Author

A comparison of the result of numerical analysis with experimental data is made for the ONERA M-6 and the practical transonic wing model 720211. The Jameson-Caughey's transonic wing programs FLO22 and FLO27 are used. The wing aerodynamic characteristics with viscous effect are evaluated by taking into account the boundary layer friction drag. This drag is calculated by using a three-dimensional compressible boundary layer program for wings, BLAY. Finally, a viscous-inviscid interaction procedure for FLO27-BLAY is proposed, and a preliminary result is presented. Author

R. C. HASTINGS and B. R. WILLIAMS 20 Dec. 1984 35 p refs
(RAE-TM-AERO-2026; BR96009) Avail: NTIS HC A03/MF A01

Measurements at Mach number 0.18 and chord-based Reynolds number 4.2 million on a constant-chord model having a NACA 4412 airfoil are compared with the results of flow field calculations. The measurements include static pressure distributions on the wing surface and on the wind tunnel walls above and below the mid-span section of the wing. The development of the upper surface boundary layer through separation (at 20% chord ahead of the trailing-edge) and on into the wake, was studied using laser anemometry. The flow field calculations are of the semi-inverse kind in which an inverse momentum-integral treatment of the shear flow, used to avoid difficulties at separation, is coupled to a direct solution of the inviscid flow problem. Results reveal the importance of shear flow in altering the disturbance introduced into the free stream by the airfoil. Measure and predictions agree well. Author (ESA)

(NAL-TR-856; ISSN-0389-4010) Avail: NTIS HC A02/MF A01

The National Aerospace Laboratory (NAL) method was applied to the response data which were obtained from subcritical flutter and divergence tests conducted in the NAL supersonic wind tunnel. Backward- and forward-swept wing models were used for the flutter and divergence tests, respectively. The stationary sampled time responses were modeled by both the autoregressive moving average (ARMA) and autoregressive (AR) processes. It has been shown that both flutter annd divergence boundaries in a supersonic flow range can well be estimated as those in the transonic flow region. Author

**LOW SPEED AERODYNAMIC CHARACTERISTICS OF A TWO-DIMENSIONAL SAIL WING WITH ADJUSTABLE SLACK OF THE SAIL**
R. G. DENBOER 1984 38 p refs
(VTH-LR-307) Avail: NTIS HC A03/MF A01

Low speed aerodynamic characteristics of a very simple dacron airfoil were investigated in a low speed, low turbulence wind tunnel. The influence of the slack of the sail on the lift coefficient cl, drag coefficient cd, and cl/cd, was studied. Measurements were performed at chord Reynolds numbers 200,000, 300,000, and 500,000 at values of the angle of attack and slack of the sail where relatively high values of the ratio cl/cd occurred. Results show that the value (cl/cd)max of the airfoil exceeds the value (cl/cd)max of a similar configuration in which a rigid circular plate of 10% camber is used instead of a sail. Author (ESA)

A system for computational design of multielement airfoils was developed. It solves the inverse aerodynamic problem in an approximate way. A priori specified aerodynamic requirements and geometric requirements are minimized in a least squares way, introducing weight factors to emphasize locally aerodynamic or geometric requirements. The system was applied to a wing with slat, exhibiting unfavorable drag characteristics. The design focused on the wing nose geometry at the slat intersection. To improve the drag characteristics a target pressure distribution was defined with a reduced suction level on the wing nose. The computations indicated that this target could be achieved with satisfactory approxiation (fulfilling at the same time a set of geometry requirements). This is confirmed by wind tunnel measurements. The tests also show a substantial drag reduction. Author (ESA)

**USING FLEET REPORTED 3-M DATA IN SUPPORT OF NAVY EMERGENCY ESCAPE PARACHUTE ASSEMBLIES**

M. A. MARTIN (U.S. Navy, Naval Weapons Center, China Lake, CA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 164-168.

The Fleet Support Branch of the Aerosystems Department, Naval Weapons Center (NWC), has the task to perform failure trend analyses on the basis of the Maintenance and Material Management (3-M) data for Navy emergency escape parachute assemblies and ther components. Details regarding the involved operations and the data bases are discussed, and the significance of the analyses is evaluated. When used in conjunction with the quality deficiency reporting system, the technical publication deficiency reporting system, and the accident investigation reports, 3-M allows an organized approach to the solution of Fleet parachute problems. **THE CANADIAN FORCES TWIN OTTER AIRCRAFT OPERATIONS IN THE ARCTIC - A THERMAL ASSESSMENT**

G. R. GAMBLE and T. ROMMET IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 212-215.

The objectives of this paper were to assess the degree of cold stress that Twin Otter aircrew are subjected to during Arctic operations, and to determine what equipment inadequacies or deficiencies were producing the high level of cold stress reported by aircrew working in this environment. Various physiological and environmental monitoring systems were utilized to assess the effects of the environment on crew members. Although comfort levels were low, no signs of even mild hypothermia were observed, however, instances of conductive cooling due to fuel spillage were observed. Improved thermal protection of the face is required, as is fuel and water protection of the hands and feet. A lightweight heater to raise aircraft interior temperatures after lengthy shut-downs would also be an asset. Author

**THE ANATOMY OF SEA SKAD (SURVIVAL KIT AIR DROPPABLE) - A CANADIAN FORCES/INDUSTRY DEVELOPMENT PROGRAM**

C. B. LOCKETT IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 216-219.

The present paper is concerned with the development of a survival kit of system which is dropped from an aircraft to persons in distress at sea. In Canada, search and rescue operations are a responsibility of the Defense Department. The SKAD project was started in connection with a requirement for Maritime Command to fulfill its secondary search and rescue (SAR) mandate with the new long range patrol aircraft, the P-3 Orion, which is called Aurora. It is pointed out that frequently these aircraft are the only Canadian Forces resource with the necessary speed, range, and endurance to perform specific tasks in the more remote regions of Canada's area of responsibility. Attention is given to efforts to seek a source of SKAD development from Canadian industry, the selection of a suitable company, the start of the development in late 1981, problems of functional demonstration, and the start of production. Each SKAD consists of two 10 person life rafts and sufficient equipment for up to 20 survivors.

**A PHILOSOPHICAL BASIS FOR THE USE OF HIGH-PERFORMANCE, GLIDING PARACHUTES IN EJECTION SEAT AIRCRAFT**

M. C. BUTLER, JR. (U.S. Navy, Naval Weapons Center, China Lake, CA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 356-361.

A ram-air inflated, gliding parachute wing capable of meeting or exceeding the performance of a round parachute in all categories, from opening shock to landing impact, is described. One of the major advantages of the ram-air parachute (RAP) over the round parachute (RP) is its inherent gliding capabilities, which increase, by a factor of 39, the area that the enemy must search in order to find the ejectee. Other advantages include the extremely fast opening characteristics of RAP, its stability in all flight modes, and its much lower rate of descent than that of an RP of comparable pack volume. A rate of descent of 15 ft/s at 300 lb suspended weight has been demonstrated at an L/D of 2.5. Data available indicate that the RAP is much more reliable than the RP when compared in the same type of applications. The costs and the time required to manufacture an RAP are the same as those of an RP.

**COMPENSATING-SLIT CANOPY DESIGN - A NEW LOW-SPEED/HIGH-SPEED PARACHUTE**

D. C. HASS (U.S. Navy, Naval Weapons Center, China Lake, CA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 362-366.

The Naval Weapons Center's (NWC's) 'compensating-slit' parachute was developed to meet a requirement for a singular parachute canopy design that would possess desirable opening shock and descent characteristics at both low and high operational airspeeds. Through the employment of a properly located tear-out slit around the perimeter of the canopy, which remains closed at low airspeed openings and opens at high airspeed openings, this parachute concept enjoys a dual-personality characteristic which results in desirable performance at both ends of the operational airspeed spectrum. Phase one of a two-phase test program, consisting of Whirltower tests and aircraft drop tests under varied test conditions, has been accomplished. Modified, standard 28-foot-diameter, flat, circular canopies (28FCs) were used in phase one because of their low cost and ease of fabrication. However, the newly-developed compensating-slit canopy is being used in phase two.

**LIGHTNING STRIKES TO A NASA AIRPLANE PENETRATING THUNDERSTORMS AT LOW ALTITUDES**

V. MAZUR (NOAA, National Severe Storms Laboratory, Norman, OK), B. D. FISHER (NASA, Langley Research Center, Hampton, VA), and J. C. GERLACH (NASA, Wallops Flight Center, Wallops Island, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 12 p. refs

(AIAA PAPER 86-0021)

The NASA Storm Hazards program was dedicated during the 1984 storm season to a study of lightning strikes on an instrumented F-106B aircraft, during penetrations of thunderstorms at altitudes lower than the 6-8 km center of lightning flash density. These altitudes coincide with the negative charge region of thunderstorms. An analysis of the correlation between the UHF band radar data obtained and TV images of lightning strikes indicates that, with a known aircraft position relative to the radar, the lightning channel motion can be adequately interpreted on the basis of radar echo evolution.

**WIND SHEAR CHARACTERIZATION**

H.-P. CHANG, D. W. CAMP (FWG Associates, Inc., Tullahoma, TN), W. FROST (Tennessee, University, Tullahoma), and J. MCCARTHY (National Center for Atmospheric Research, Boulder, CO) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs

(AIAA PAPER 86-0180)

Computer simulations of a B727 type aircraft flying through the JAWS microburst wind shear data have been developed and the results evaluated. The results are in good agreement with those obtained from the NASA/Ames B727 piloted simulator. The aircraft trajectory deviations from the intended flight path at the ILS CAT II decision height window are calculated for finding critical penetration heights through the center of the microburst. Based on the aircraft's dynamic responses in the simulations, the JAWS microburst wind fields are classified into light, moderate, and severe cases, which represent interesting simulator training scenarios. Finally, the wind shear effects on three generic types of aircraft, a three-engine passenger airliner, a twin-engine STOL, and an executive jet, are investigated. Large jet aircraft experience greater difficulty in flight through microburst wind shear fields than smaller aircraft.

**DETERMINING THE EFFECTS OF WEATHER IN AIRCRAFT ACCIDENT INVESTIGATIONS**

J. C. MCLEAN, JR. (National Transportation Safety Board, Washington, DC) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 7 p.

(AIAA PAPER 86-0323)

Weather is often a principal factor in aircraft accidents and the documentation and analysis of the weather elements becomes a major part of the accident investigation. Selected accident investigations are reviewed to describe some of the techniques used to determine what weather elements may be pertinent or critical to an accident, the sources of weather information, and the methods of analyzing the information to satisfy the requirements of the investigation.

**METEOROLOGICAL FACTORS IN SELECTED AIRCRAFT ACCIDENT INVESTIGATIONS**

R. E. CALE (E.R.A. Services, Inc., Cerritos, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 6 p.

(AIAA PAPER 86-0324)

Post-analysis of accident environments provides an opportunity for considerably better meteorological information than is possible with forecast services. This is due to having data after the fact as well as before, and the time to pursue in-depth analysis of available data - specializing the effort to each particular problem. Examples are given from a number of case studies of the use of applied meteorological techniques to determine environmental factors

useful to aeronautical experts in determining probable cause.

**WEATHER-INVOLVED U.S. AIR CARRIER ACCIDENTS 1962-1984 - A COMPENDIUM AND BRIEF SUMMARY**
R. D. RUDICH (Air Transportation Consultants, Ltd., Alexandria, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 8 p. refs
(AIAA PAPER 86-0327)

The documentation of 32 aircraft accidents which occurred over the past quarter century and were related to weather phenomena are summarized. All the accidents were investigated by the NTSB and the findings are cited. A total of 16 types of passenger aircraft were involved in the accidents, which resulted in a total of 789 fatalities and 321 additional serious injuries. Thunderstorms were the most frequent meteorological condition associated with accidents, closely followed by severe wind shear (microburst) events. Failures of cockpit personnel and aircraft-ATC to communicate available weather data are frequently cited as the situations which led to the accidents. M.S.K.

(Contract NGL-22-009-640)
(AIAA PAPER 86-0410)

Results of tests to measure ice accretion in real-time using ultrasonic pulse-echo techniques are presented. Tests conducted on a 10.2 cm diameter cylinder exposed to simulated icing conditions in the NASA Lewis Icing Research Tunnel and on an 11.4 cm diameter cylinder exposed to natural icing conditions in flight are described. An accuracy of + or - 0.5 mm is achieved for real-time ice thickness measurements. Ice accretion rate is determined by differentiating ice thickness with respect to time. Icing rates measured during simulated and natural icing conditions are compared and related to icing cloud parameters. The ultrasonic signal characteristics are used to detect the presence of surface water on the accreting ice shape and thus to distinguish between dry ice growth and wet growth. The surface roughness of the accreted ice is shown to be related to the width of the echo signal received from the ice surface. Author

The characteristics which make airport accidents different from other nonaircraft accidents are described. Immediate evaculation of the casualties and their transport to medical facilities is the basis of an airport rescue operation. The utilization of the airport crew, close medical aid, and distant medical facilities is examined. The notification of the medical personnel of an emergency and means of providing orientation and guidance for them at the airport are analyzed. Management of the crash site, including development of the medical staff and evacuation and treatment of the casualities, especially burn victims and uninjured passengers, by a command group, is discussed. The advantages of practicing a disaster plan are addressed. I.F.

**AIRCRAFT ACCIDENT REPORT: MIDAIR COLLISION OF WINGS WEST AIRLINES BEECH C-99 (N666U) AND AESTHETEC INC., ROCKWELL COMMANDER (N112SM), NEAR SAN LUIS OBISPO, CALIFORNIA, AUGUST 24, 1984**
24 Aug. 1984 52 p
(NTSB/AAR-85/07) Avail: NTIS HC A04/MF A01

At 1117:38 Pacific daylight time, on August 24, 1984, Wings West Airlines, Flight 628, a Beech C-99 (N6399U), and Aesthetec Inc., Rockwell Commander 112TC, N112SM, collided in midair near San Luis Obispo, California. The weather at the time of the collision was clear. Flight 628 had just departed San Luis Obispo County Airport en route to San Francisco International Airport, California, and was climbing on a westbound heading. The Rockwell Commander had departed Paso Robles, California, on a training flight and was descending toward the San Luis Obispo County Airport on an eastbound track. The airplanes collided head-on at an altitude of about 3,400 feet. The wreckage of both airplanes fell into an open field 8 nmi west northwest of the San Luis Obispo County Airport. All 17 persons, including the 2 pilots and 13 passengers onboard flight 628 and the 2 pilots onboard the Rockwell, were killed. The National Transportation Safety Board determines that the probable cause of this accident was the failure of the pilots of both aircraft to follow the recommended communications and traffic advisory practices for uncontrolled airports contained in the Airman's Information Manual to alert each other to their presence and to enhance the controller's ability to provide timely traffic advisories. **LOCAL AREA COMMAND/CONTROL NETWORKS: THE DESIGN OF AN ON-BOARD NETWORK - ANTINEA [RESEAUX LOCAUX DE COMMANDE-CONTROLE: CONCEPTION D'UN RESEAU EMBARQUE - ANTINEA]**

J.-C. VALADIER Toulouse, Institut National Polytechnique, Doctorat Thesis, 1985, 142 p. In French. refs

A design is proposed for a local area network (LAN) for use on aircraft. The LAN is intended for avionics system which feature distributed interconnected computers. In aircraft, operations must be in real-time with a reaction time of less than 0.5 msec to avoid compromising flight safety. The ANTINEA project was initiated in 1982 to develop a second generation LAN which would acommodate distributed command/control points. The goal was to increase the number of possible data exchanges, lower the access time, and ensure reliability in the system. The ANTINEA system includes 40 Mbps operational rate using optical fiber links. Each signal travels unidirectionally through a repeater unit, which may be redundant. Simple computations can be carried out on a decentralized basis, while overall computational reliability is directly dependent on the extent of redundancy built into this token ring system. Reliability is further enhanced if the system architecture includes a backup token ring. Finally, techniques are discussed for assigning priorities to control the data traffic and minimize the system access time. M.S.K.

**EVOLUTION OF THE AIR TRAFFIC CONTROL BEACON SYSTEM**

C. F. PHILIPS (Westinghouse Defense and Electronics Systems Center, Baltimore, MD) The Controller (ISSN 0010-8073), vol. 24, Dec. 1985, p. 18-20, 22-24.

The operation of the air traffic control (ATC) beacon system in modes A and C is described. The interference problem in the controller's display resulting from the increased number of aircraft with transponders is investigated; the synchronization of replies with the interrogation rate of the ground interrogator and staggering of regional interrogation rates eliminates this interference. The operation of the sidelobe suppression system designed to reduce sidelobe interference is examined. The development of a 5 foot high open array to reduce interference is discussed. The design of mode S, which reduces the number of ground interrogations, for the operation of the beacon system is described. The monopulse processing, selective interrogation, and digital data link of mode S are analyzed. I.F.

**EVALUATION OF 23 INCH RADAR VIEWING UNIT FOR HEATHROW APPROACH CONTROL ROOM**

Jul. 1985 24 p refs

(CAA-PAPER-85011; REPT-516) Avail: Issuing Activity

The possibility of replacing pairs of 16 in approach radar viewing units (RVU) by single 23 in units was assessed in a simulation with 20 air traffic controllers. The subjective and numerical evidence indicates that a single 23 inch RVU is an acceptable replacement. The lack of suitable range settings made it difficult for controllers to comment about the suitability of the RVU for the initial planning task. However, the indications are that the monitoring and sequencing tasks could be carried out satisfactorily. In the event of an RVU failure, a controller could maintain a radar service for a maximum of 5 min by sharing a neighboring RVU. Author (ESA)

**CONSTRUCTION OF A MEASURING METHOD USING FIBER OPTICS AND AN LTN-90 LASER GYRO STRAPDOWN SYSTEM FOR BO-105 HELICOPTERS**

H. J. HOTOP and H. P. ZENZ May 1985 48 p refs In GERMAN; ENGLISH summary

(DFVLR-MITT-85-10; ISSN-0176-7739) Avail: NTIS HC A03/MF A01; DFVLR, Cologne DM 19

A Modular Universal Data Acquisition System 2 (MUDAS 2) equipped with an LTN-90 laser gyro strapdown navigation system and with a fiber optic data bus for transmission of ARINC-429 signals was developed for onboard testing of navigation systems. It was tested on a BO-105 helicopter during flights for applicability on helicopters and flexibility in data acquisition and recording. The system was studied on long distance flights and on strong maneuver flights. Signals of the LTN-90 system were compared with the data of the Precision Automated Tracking System laser radar. Application of fiber optics for data transmission of bit serial signals (200 Hz NRZ Code) is proved. The LTN-90 navigation system designed for surface aircraft can be applied without loss of accuracy. Author (ESA)

**A SOPHISTICATED TRACKING ALGORITHM FOR AIR TRAFFIC CONTROL (ATC) SURVEILLANCE RADAR DATA**

H. A. P. BLOM 9 Jan. 1984 10 p refs Presented at International Conference on Radar, Paris, France, 21-24 May 1984

(NLR-MP-84004-U; B8566260) Avail: NTIS HC A02/MF A01

An algorithm based on martingale tools for application to sudden aircraft maneuvers in radar tracking was developed. It is a Markov jump-diffusion model. It provides very accurate state estimates during unchanged flight modes, very fast reaction and convergence after changes, and good estimates of its own accuracy. Comparison with an alpha-beta tracker, a Kalman based tracker, and a state-of-the-art tracker proves the superior performance of the algorithm. Author (ESA)

**COMPARISON OF A JUMP-DIFFUSION TRACKER WITH A KALMAN TRACKER: AN EVALUATION WITH EMPHASIS ON AIR TRAFFIC CONTROL**

H. A. P. BLOM 30 Mar. 1983 39 p refs

(NLR-TR-83063-U; B8569022) Avail: NTIS HC A03/MF A01

Radar tracking algorithms are compared. A probabilistic approach to the tracking problem is a Markov jump-diffusion model for the aircraft dynamics, its control, and the radar measurements. From nonlinear filtering theory, a closed form description of the evolution of the conditional distribution of this Markov process can be obtained. This jump-diffusion filter, however, is infinite dimensional and approximations are necessary for algorithmic implementation. The indirect approach of approximating the jump-diffusion by a diffusion leads to a Kalman-like tracker. The approach of approximating the jump-diffusion filter directly leads to a bank of interacting Kalman-like trackers. Comparison for air traffic control shows that the jump-diffusion tracker performs considerably better than the Kalman tracker. Author (ESA)

**YAW STABILIZATION OF AN OPEN EJECTION SEAT, FACT OR FANTASY?**

W. R. PECK (Stencel Aero Engineering Corp., Asheville, NC) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 51-54.

A discussion is presented of efforts to date toward the development of yaw stabilization systems for high performance aircraft ejection seats, having as a goal the reduction of crew injuries due to lateral accelerations. Such systems entail compatibility with existing aircraft cockpits, and stabilization elements that are passive and aerodynamic in nature. Attention is given to several prepossessing designs, as well as to Mach 0.3 and 0.75 aerodynamic data obtained through wind tunnel testing of one of these devices. O.C.

**THE FUTURE OF ADVANCED CREW ESCAPE CAPSULE TECHNOLOGY**

D. E. MCCAULEY (McDonnell Aircraft Co., St. Louis, MO) and M. I. DARRAH (McDonnell Douglas Corp., St. Louis, MO) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 59-62.

This presentation reviews technology and biodynamics pertinent to crew escape for future high performance fighters. It discusses various capsules and their materials, supporting subsystems, limits, and adaptations necessary to permit survival when conditions exceed human tolerance. Hazards associated with escape are also presented, including temperature extremes, hypoxia, low pressure, and high accelerations. Discussions will emphasize high speed, high altitude atmospheric fighters, and transatmospheric vehicles. The escape capsule systems of the future will require continual sensing of critical parameters, offering the prognosis of an artificially intelligent escape system, predicated on life support of the crew. Author

**DEVELOPMENT OF MECHANICAL COMPONENTS FOR ADVANCED AIRCREW SEATING SYSTEMS**

R. L. FARRIS (Pacific Scientific Co., Kin-Tech Div., Anaheim, CA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 63-66.

A discussion is conducted concerning the development status, design features and obtainable performance of mechanical components used in the crew seats of advanced aircraft as safety/escape devices. Attention is given to crew harness inertia reels, harness systems, lap belt cinchers, inflatable head and body restraints, infinite rotary positioners, vapor springs, and mechanical linear load limiters. Both rotary and fixed wing aircraft crew seating equipment are considered. O.C.

**A86-19308**

**THE CONTINUING REQUIREMENT FOR HELICOPTER ESCAPE**

W. L. TRAYNOR (Stencel Aero Engineering Corp., Asheville, NC) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 67-70. refs

An evaluation of the development history of helicopter crew survivability measures and devices in the U.S. leads to the observation that efforts have concentrated in the area of vehicle crashworthiness to the exclusion of in-flight escape. It is noted that the high helicopter damage probability experienced in Vietnam conflict battles as a result of heavy Soviet-built machine gun fire has direct implications for future encounters of such weapons by U.S. combat helicopters. O.C.

**F-111 ESCAPE SYSTEMS - TODAY'S MODULE TECHNOLOGY**

G. W. LARSON (General Dynamics Corp., Fort Worth, TX) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 77-80.

The crew module, in its use in the F-111, has proven to be an excellent escape system. The first ejection occurred in October 1967. Statistically, since that time the percentage of safe ejections has been equal to or better than that of open seat systems. Because of the large number of explosive components in the module, the major effort for improvements has been toward extending the service life of these units. New developments in fabrication techniques that permit the design of hermetically sealed subassemblies now provide life-of-airplane capability for explosive devices. Author

**ALTITUDE AND ACCELERATION PROTECTION SYSTEM FOR HIGH PERFORMANCE AIRCRAFT**

A. GUPTA and M. B. MCGRADY (Boeing Military Airplane Co., Seattle, WA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 95-98.

An advanced, integrated breathing and anti-G system capable of providing aircrew protection for altitude exposures up to 60,000 feet and sustained accelerations up to 9 G(Z) is presented. The system utilizes an On-Board Oxygen Generating System controlled by a fast response fluidic oxygen partial pressure sensor, and a fast acting electronic anti-G valve. Significant features include (1) automatic selection and control of breathing gas supply, (2) simultaneous controlled pressurization of G-suit, jerkin, mask and mask-tensioning bladders, (3) low breathing resistance, (4) simple control and indication, and (5) high system integrity during probable failure conditions or ejection. **AIRCREW ESCAPE SYSTEM MODELS USED IN WIND TUNNEL TESTS**

F. J. SACKLEH (USAF, Arnold Engineering Development Center, Arnold Air Force Station, TN) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 103-108.

The AEDC 16-ft and 4-ft transonic wind tunnels (16T and 4T) have supported the development of ejection seats for Air Force aircraft. This paper describes the wind tunnel models and model supporting hardware used on representative tests and also describes planned improvements in separation test capabilities. In the 16-ft transonic wind tunnel, subscale models of developmental ejection seats and capsules have been tested. Instrumentation include internally mounted six-component balances, anthropomorphic dummies with surface strain gages, and pressure transducers. Jettison plumes are simulated with high-pressure air, and effectiveness of various stabilizing devices are evaluated. Model attitudes are varied within wide ranges of pitch angle and yaw angle. In the 4T transonic wind tunnel, a separation test using two separate stings for canopy and aircraft was recently accomplished. This two-sting capability is also planned for the larger 16-ft wind tunnel. Author

### DEVELOPMENT OF AN ELECTRO-PNEUMATIC ANTI-G VALVE FOR HIGH PERFORMANCE FIGHTER AIRCRAFT

R. E. VAN PATTEN, T. J. JENNINGS, W. ALBERY, J. W. FRAZIER (USAF, Aerospace Medical Research Laboratory, Wright-Patterson AFB, OH), and C. GOODYEAR (Systems Research Laboratories, Inc., Dayton, OH) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 112-116. USAF-supported research. refs

A new concept for an anti-G suit valve was designed and built at the Air Force Aerospace Medical Research Laboratory. The valve is designed specifically to protect aircrew from the unique physiological hazard of high onset rate, high sustained acceleration. The design is a hybridization of a conventional inertially operated valve, and uses an electronically controlled solenoid to drive the anti-G suit pressure to the maximum when the level of acceleration exceeds both +2 G(z) and an onset rate of 2 G/sec. After a 1.5-sec period, the valve reverts to inertial operation unless the trigger criteria are fulfilled again. Relaxed tolerance of 15 human subjects was determined under high rate of onset centrifuge testing of the new valve (with and without ready pressure) versus the standard valve and a high flow ready pressure valve. The new concept provides a 1 G improvement over the standard valve, and a 0.5 G improvement over the high flow ready pressure valve. On the basis of published data taken under similar conditions, the new valve appears to provide a 0.5 G improvement over all electronic servo valves. Pilot acceptance of this rapid acting concept has been favorable. Author

### VECTORED THRUST DIGITAL CONTROL OF EJECTION SEATS

J. V. CARROLL (Scientific Systems, Inc., Cambridge, MA) and M. K. KLUKIS (Martin Marietta Engineering Computer Center, Orlando, FL) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 117-121. USAF-supported research. refs

A closed loop control law design for open ejection seats is presented and discussed. The combination of worsening survival statistics during crew escape in recent years and improving control component technology has made such a study timely and practical. The control technique is based on nonlinear acceleration control, which exploits very well the unique and highly nonlinear characteristics of the pilot/seat system. This paper reviews the design of the controller, including the related actuator configuration and microprocessor architecture issues. A breadboard hybrid simulation, utilizing a wire-wrapped electronic digital controller and a unique vectored thrust actuation concept, has been developed for real time analysis of the concept and is also discussed in this paper. This real time ejection seat controller breadboard analysis capability represents a major step in the evolution of the 'smart' seat, from concept and digital simulation to fabrication, sled testing and production. This design represents a reasonable approach for the control of the seat in its harsh, highly constrained environment, over diverse escape conditions. Author

### CONTROL LAW AND LOGIC DEVELOPMENT FOR CONTROLLABLE EJECTION SEAT CATAPULT

A. K. TRIKHA (Boeing Military Airplane Co., Seattle, WA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 132-137.
(Contract F33615-83-C-3045)

An adaptive ejection seat catapult has been developed which can adjust its thrust to variations in seat/crewperson weight, propellant temperature, and airplane g values. As a result, the rail tipoff velocity can be maximized without exceeding the crewperson's dynamic response index. Simulation results are presented to show that the objective has been met for flight conditions with variations in crewmember/seat weight between 272 to 444 lb, operating temperatures ranging from -65 to +160 F, and the aircraft acceleration of +10 g (compression) to -3 g (tension). The catapult diagram and the control law and logic diagram are included. I.S.

### A MICROPROCESOR SEQUENCER FOR THE ADVANCED NAVY EJECTION SEAT

P. AYOUB (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 195-199.

In the case of current Navy Escape Systems, only a limited number of operational modes is available. As an example, a present operational system uses a total of four timing modes to cover the entire ejection cycle. The present paper is concerned with an alternative to the fixed mode selection. A great improvement in system performance is achieved by utilizing currently available microprocessor technology to analyze airspeed and altitude inputs and select from a wide range of programmed operational modes. It is pointed out that this improvement is realized without a sacrifice to system reliability. G.R.

**A86-19339**

### CONTROLLABLE EJECTION SEAT CATAPULT PROGRAM

S. J. BAUMGARTNER (Boeing Military Airplane Co., Seattle, WA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 237-245.

The Controllable Ejection Seat Catapult (CESC) Program is being sponsored by Air Force Wright Aeronautical Laboratories, Flight Dynamics Laboratory, Crew Escape Branch (AFWAL/FIER). The contract was awarded to an American aerospace company on September 16, 1983. An ejection seat catapult has the function to propel the ejection seat out of an aircraft cockpit during emergency ejection conditions. According to the operational performance objective for the catapult, the velocity reached at the end of the catapult stroke is to be maximized without reaching acceleration levels which are harmful to the crewperson. Under certain conditions, the fixed performance capability of the present day catapult becomes unacceptable. The considered program was initiated with the objective to develop a catapult which is free of the drawbacks of the currently used models, taking into account a catapult concept capable of providing a controllable thrust level for a conventional upright ejection seat. G.R.

### VERY LARGE STATIONARY AERIAL PLATFORMS

R. S. LEONARD (BDM Corp., Albuquerque, NM) IN: The National Symposium and Workshop on Optical Platforms, Huntsville, AL, June 12-14, 1984, Proceedings . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 446-457. Research supported by the BDM Corp. refs

The development of rigid, semirigid, and nonrigid airships, to operate at altitudes above 40,000 ft for environmental monitoring, ship traffic control, surveillance, and as high altitude observatories is examined. A comparison of airships with aircraft is presented;

the advantages of modern airships are discussed. The materials used for the structure of the airship, which consists of rings, griders, wire bracing, outer skin fabrics, and gas cells, are described. The powering of the airship with electricity from microwave energy is studied. Potential construction sequences which will make the development of the airship economically feasible are analyzed. **DIVERGENCE STUDY OF A HIGH-ASPECT RATIO, FORWARD-SWEPT WING**

S. R. COLE (NASA, Langley Research Center, Hampton, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs
(AIAA PAPER 86-0009)

A study has been conducted in the NASA-Langley Transonic Dynamics wind tunnel to determine the divergence characteristics of a high aspect ratio forward swept wing of rectangular planform, for sweep angles of zero, -15, -30, -45, and -60 deg. In addition to a rectangular wingtip, a tip whose geometry lay parallel with the freestream flow was tested at a sweep angle of -45 deg. The primary objective was to obtain data that could be used to verify the divergence prediction capabilities of an aeroelastic analysis code employing kernel function aerodynamics. The analytical predictions of convergence were found to be conservative for all forward sweep angles, and the effect of the two tip shapes on divergence dynamic pressure were accurately predicted. O.C.

**DESIGN OF A TWIN-ENGINE SHORT-HAUL COMMUTER AIRCRAFT FOR THE 1990S**

E. D. COOPER and D. W. MCKENNA (California Polytechnic State University, San Luis Obispo) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. refs
(AIAA PAPER 86-0077)

Taking fuel economy as the primary design criteria for a low direct operating cost (DOC) commuter airliner for the 1990s, a configuration incorporating a 'joined wing' planform and pusher propfans was developed which is projected to yield substantial increases in propulsion efficiency and decreases in weight and drag. The DOC of this design, which is noted to depend on no high risk, novel technologies, was found to be significantly lower than a comparably scaled cantilever wing aircraft. Operating costs were found to be comparable. O.C.

**LABORATORY STUDY OF THE EFFECTS OF SIDEWALL TREATMENT, SOURCE DIRECTIVITY AND TEMPERATURE ON THE INTERIOR NOISE OF A LIGHT AIRCRAFT FUSELAGE**

K. E. HEITMAN and J. S. MIXSON (NASA, Langley Research Center, Hampton, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs
(AIAA PAPER 86-0390)

This paper describes a laboratory study of add-on {coustic treatments for a twin-engine, propeller-driven aircraft fuselage. The sound source was a pneumatic-driver, with attached horn to simulate propeller noise distribution, powered by a white noise signal. Treatments included a double-wall, production-line treatment and various fiberglass and lead-vinyl treatments. Insertion losses, space-averaged across six interior microphone positions, were used to evaluate the treatments. In addition, the effects of sound source angle and ambient temperature on interior sound pressure level are presented. The sound source angle is shown to have a significant effect on one-third octave band localized sound pressure level. While changes in ambient temperature are shown to have little effect on one-third octave band localized sound pressure level, the change in narrowband localized sound pressure level may be dramatic. **FLIGHT TEST MANEUVER MODELING AND CONTROL**

P. K. A. MENON, R. A. WALKER (Integrated Systems, Inc., Palo Alto, CA), and E. L. DUKE (NASA, Flight Research Center, Edwards, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. refs
(Contract NAS2-11877)
(AIAA PAPER 86-0426)

The use of automated flight test schemes decrease the aircraft flight testing time and pilot work load while enhancing the data quality. Two major elements involved in developing such an automated technique are maneuver modeling to generate command histories from the maneuver specifications and the synthesis of control systems to track these command histories. This paper describes the maneuver modeling for eight flight test trajectories. The control system synthesis with Kosut's suboptimal minimum error excitation linear quadratic regulator approach is presented. The closed-loop simulation results are given. Author

**DEVELOPMENT OF PNEUMATIC THRUST-DEFLECTING POWERED-LIFT SYSTEMS**

R. J. ENGLAR (Lockheed-Georgia Co., Marietta), J. H. NICHOLS, JR., M. J. HARRIS (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD), J. C. EPPEL, and M. D. SHOVLIN (NASA, Ames Research Center, Moffett Field, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 13 p. refs
(AIAA PAPER 86-0476)

Improvements introduced into the Circulation Control Wing/Upper Surface Blowing (CCW/USB) STOL concept (Harris et al., 1982) are described along with results of the full-scale static ground tests and model-scale wind tunnel investigations. Tests performed on the full-scale pneumatic thrust-deflecting system installed on the NASA QSRA aircraft have demonstrated that, relative to the original baseline configuration, a doubling of incremental thrust deflection due to blowing resulted from improvements that increased the blowing span and momentum, as well as from variations in blowing slot height and geometry of the trailing edge. A CCW/Over the Wing model has been built and tested, which was shown to be equivalent to the CCW/USB system in terms of pneumatic thrust deflection and lift generation, while resolving the problem of cruise thrust loss due to exhaust scrubbing on the wing upper surface. I.S.

**THE BASICS OF ON-BOARD SIMULATION AND EMBEDDED TRAINING**

B. J. BRADY (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH), R. P. MEYER, R. E. LAMBERT, and C. A. SCOLATTI (McDonnell Aircraft Co., St. Louis, MO) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. refs
(Contract F33615-78-C-3601)
(AIAA PAPER 86-0493)

Embedded training systems (ETS) which use on-board helmet-mounted displays (HMD) to turn fighter aircraft into real-time in-flight simulators are described. A threat situation is presented on the HMD by the ETS computer program and is treated as real by all avionics, thereby joining the features of ground-based simulation and tactical training. The instruments, flight and fire control systems remain active during the encounters with the enemies generated internally. Simulated missiles can be viewed as they fly toward the target(s), which fly programmed tactical maneuvers corresponding to generic enemy aircraft. The realism of the system is enhanced by the presence of actual aerodynamic forces and controls, and the embedded models can even provide radar displays of the visually sighted targets. Trials which will be carried out to evaluate the effectiveness of the ETS are outlined. M.S.K.

**DESIGNING AN ELECTRO-IMPULSE DE-ICING SYSTEM**
G. W. ZUMWALT and R. A. FRIEDBERG (Wichita State University, KS) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs
(Contract NAG3-284)
(AIAA PAPER 86-0545)

Basic principles and parameters for a system to deice aircraft with electromagnetic impulses are described. The physical basis for deicing by such impulses is explained, and the requirements involved in the electrodynamic design, structural dynamic design, and system design are discussed. Some manufacturing and testing problems and techniques are described. C.D.

**A86-19941#**
**THE ELECTRODYNAMIC OPERATION OF ELECTRO-IMPULSE DEICING SYSTEMS**
G. J. LEWIS (Rolls-Royce, Ltd., Derby, England) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. SERC-supported research. refs
(AIAA PAPER 86-0547)

An analysis of the transient exciting current situation is presented. The derivation of the magnetic vector potential equation and its solution using the Laplace and Hankel transforms are described. With the solution of the vector potential equation physical qualities, such as azimuthal force, and impulse, which relate to electro-impulse deicing systems performance are calculated. An experiment measuring the normal impulse on the plate is provided. The dependence of impulse on plate thickness, plate conductivity, plate separation, and discharge frequency is investigated. The theoretical and experimental data show good correlation. An example of an electro-impulse deicing system designed to the specification of the structure being deiced is given. I.F.

**A86-20036#**
**THE DAMAGE TOLERANCE APPROACH IN THE TYPE APPROVAL PROCESS**
P. FERNANDEZ-RUIZ (Transport Canada, Airworthiness Branch, Ottawa) (CASI, Annual General Meeting, 31st, Ottawa, Canada, May 28, 1984) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 31, March 1985, p. 3-13. refs

The optimization of maintainance procedure for type approval of commercial aircraft is studied. The damage tolerance concept, which is to predict the behavior of aircraft structures under applicable loading conditions, is based on the time it takes for cracks to appear and damage to grow. The time intervals in the maintenance program, threshold inspection level, and repeat inspection interval, are explained. The procedures to be followed by a manufacturer to achieve airworthiness certification of the aircraft are discussed. The selection of materials for design of structures that have high yield, stress, high fracture toughness, and crack growth is examined. The use of load analyses, crack growth models, test data, and numerical integration in the evaluation of aircraft structures is described. The comparison of predicted crack growth values with predefined crack growth and the development of crack growth diagrams for each structure is possible following the analyses. The damage tolerance criteria requires that the aircraft be capable of successfully completing a flight during which structural damage is possible. The testing of the ability of the pressurized fuselage to sustain impact is investigated. I.F.

**A86-20038#**
**HELICOPTER FATIGUE MONITORING USING A SINGLE CHANNEL RECORDER**
D. L. SIMPSON (National Aeronautical Establishment, Structures and Materials Laboratory, Ottawa, Canada) (CASI, Annual General Meeting, 31st, Ottawa, Canada, May 28, 1984) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 31, March 1985, p. 30-44. refs

The use of single channel recorders and loaded transfer functions to monitor fatigue damage in CH-113 helicopters is investigated. The equipment used includes two single channel recorders for monitoring the output from strain gauges on the longitudinal pitch links on both the fore and aft rotors, and the Rainflow counting method of Hutchinson and Steinman (1980) for data compression. Techniques used to generate transfer functions are analyzed. Identification of the maneuvers which produce cycles that exceed the component endurance limit by applying flight load survey data, and the methods of treating loads above the endurance limit are described. The analyses reveal that conservative estimates of fatigue damage are calculated using transfer functions and the measured longitudinal pitch load spectrum. It is concluded that indirect monitoring of fatigue damage with single channel recorders is possible; however, improvements in instrumentation are required to provide an increase in the percentage of accurate data obtained. I.F.

**A86-20039#**
**ASSESSING COST-EFFECTIVE WEIGHT SAVING IN AIRCRAFT OPERATIONS**
D. G. PECK (Transport Canada, Ottawa) (CASI, Annual General Meeting, 31st, Ottawa, Canada, May 28, 1984) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 31, March 1985, p. 45-51.

Three methods of establishing cost/weight savings for aircraft are analyzed. The first method described involves measuring the value of the weight by useful load; dividing the points of useful load into the aircraft cost will establish the cost/pound value of the aircraft. A table of values of useful load for various aircraft types is provided. The second technique which calculates the value of weight by the amount of fuel saved is examined; it is observed that jets provide more savings than propeller aircraft and more flight time increases savings. The usefulness of the third method where a value is assigned to weight saving revenue purposes is revealed through an example. I.F.

**A86-20125**
**BIGGER IS BETTER - STRETCHING THE C-141 STARLIFTER**
R. A. SAPP (Lockheed-Georgia Co., Marietta, GA) Lockheed Horizons, Oct. 1985, p. 38-44.

A development history is presented for the fuselage-stretching modification undertaken in 1975 for the C-141 cargo aircraft, yielding the C-141B. The fuselage was extended 280 in by inserting a 160-in. plug ahead of the wing, and a 120-in. plug behind it, on an existing C-141A aircraft. In addition, the modification program imparted inflight refueling capabilities, and altered the spanwise wing lift distribution by changing the wing/fuselage fairing structure. The midfuselage structure was reinforced through the addition of a central longeron underneath the cargo floor. Attention is given to the splicing of the plugged fuselage section. O.C.

**BLENDED BLOWN FLAPS AND VECTORED THRUST FOR LOW-SPEED FLIGHT**

J. E. CARR (Grumman Aerospace Corp., Bethpage, NY) Journal of Aircraft (ISSN 0021-8669), vol. 23, Jan. 1986, p. 26-31. refs
(AIAA PAPER 84-2199)

Short take-off and landing (STOL) capability is a recurring design goal for current and future aircraft design studies to meet reduced field length requirements, provide increased stores 'bring back' capability, enhance carrier aircraft payload launch and recovery envelopes, and improve in-flight maneuvering. The Grumman Corporation has conducted a study to design and build an A-6 STOL demonstrator aircraft for the Navy that employs two-dimensional vectored nozzles and chordwise blowing for low-speed flight. If completed, this program would demonstrate operationally acceptable STOL performance with minimum loss in cruise performance. The results of a two-dimensional airfoil test determined that a plain blown flap with a large-radius, upper leading-edge blowing segment and a conventional-shaped trailing-edge section had better high-lift capability for the available blowing momentum of the design. Extensive three-dimensional wind tunnel testing verified predicted longitudinal characteristics, showed acceptable longitudinal and lateral directional control, and defined design limitations associated with the high-lift systems. **ENDURANCE INCREASE BY CYCLIC CONTROL**

G. SACHS and T. CHRISTODOULOU (Muenchen, Technische Universitaet, Munich, West Germany) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 9, Jan.-Feb. 1986, p. 58-63. refs

Applying the minimum principle, maximum endurance flight is considered as an optimal cyclic control problem with a state variable constraint. It is shown that a significant increase in the maximum endurance can be achieved by dynamic flight having an optimal cyclic control when compared to the best steady-state flight. The optimal altitude range within the flight envelope is determined. Furthermore, it is shown that the powerplant type represents a key factor when compared to other aircraft characteristics. From this, it follows that turbojet-type engines have properties that can increase endurance via cyclic control. With regard to propeller-type powerplants, however, there appears to be no or only small improvements possible for the cyclic model considered here. It is also shown that an increase in the maximum lift/drag ratio improves the cyclic control efficiency, which is more enhanced than steady-state flight efficiency. Author

**ELIMINATION OF BUFFETING ON THE REAR FUSELAGE OF THE HERCULES TANKER**

D. G. MABEY (Royal Aircraft Establishment, Dynamics Laboratory, Bedford, England) Aeronautical Journal (ISSN 0001-9240), vol. 89, Nov. 1985, p. 339-342.

The conversion of the Hercules aircraft for flight refuelling necessitated the installation of a small drogue box on the lower surface of the rear fuselage. This produced a long flow separation and unacceptable rear fuselage and elevator buffeting at the drogue towing speeds required. The flow separation was stabilized, and the buffeting eliminated, by the installation of strakes and the provision of a small bleed flow through the drogue box. Author

**GEOMETRY GENERATION FOR TRANSONIC DESIGN**

H. SOBIECZKY (DFVLR, Institut fuer theoretische Stroemungsmechanik, Goettingen, West Germany) IN: Advances in computational transonics . Swansea, Wales, Pineridge Press, 1985, p. 163-182. USAF-sponsored research. refs

Since demands for higher efficiency and improved performance have led to the operation of aircraft in the transonic regime, computational design procedures for both aircraft and turbomachinery have become increasingly important. The designed aircraft components have to be integrated into realistic configurations, and wind tunnel tests and refined investigations are required to predict aerodynamic performance reliably. As a result of the need of refined shape definition, the generation of geometry has become an important part of computational aerodynamics. The present paper is concerned with a flexible geometry generator which is based on a set of parameters and analytical relations. The geometry generator is to provide input data for a number of existing transonic analysis algorithms and some shock-free flow design codes. Aspects of shape generation are discussed, taking into account simple analytical relations, a fuselage geometry definition, a wing geometry definition, and wing integration to fuselage. Attention is also given to airfoil design and analysis, and computational grid generation. G.R.

**SOCIETY OF EXPERIMENTAL TEST PILOTS, SYMPOSIUM, 28TH, BEVERLY HILLS, CA, SEPTEMBER 26-29, 1984, PROCEEDINGS**

Lancaster, CA, Society of Experimental Test Pilots, 1984, 321 p. For individual items see A86-21052 to A86-21054, A86-21056 to A86-21068.

Papers are presented on supersonic conventional weapon testing, F-14A low-altitude, low-airspeed, high-angle-of-attack asymmetric thrust flight test program, initial sea trials of the AV-8B Harrier aircraft, flight tests of the helicopter pneumatic deicing system, and testing the modern composite scaled prototype. Consideration is given to F/A-18 ski jump takeoff evaluation, nonrigid airship testing, helicopter evasive maneuvering flight test, testing Canadian unique features of the CF-18, AV-8B Harrier II structural test program, probe and drogue refueling large receiver aircraft, and high speed escape systems. In addition, flight testing the fixed wing configuration of the rotor systems research aircraft, F-15 dual-role fighter flight testing, Space Shuttle development update, Space Shuttle night landing, and orbital flight test of the manned maneuvering unit are discussed. I.S.

**A86-21052**

### SUPERSONIC CONVENTIONAL WEAPON TESTING OF THE F/A-18A HORNET

J. C. STENCIL and J. PICKERAL (U.S. Navy, Naval Air Test Center, Patuxent River, MD) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 4-16.

The F/A-18A Hornet is the Navy's first tactical airplane to provide supersonic carriage and release of conventional weapons. In the course of an extensive weapon separation analysis and flight tests, the envelope expansion has uncovered interesting integration phenomena, some related to the aircraft, and some related to existing weapons hardware. The combination of an airplane with the performance capability for supersonic carriage and delivery and the extensive use of composite materials in its construction presented unique test and evaluation challenges. This paper discusses limit cycle oscillations of the wing under certain store loadings, supersonic conventional weapon separation testing of general purpose weapons, and hardware deficiencies which potentially have serious impact on the aircraft tactical envelope. The need to improve conventional weapons for the new generation of supersonic strike fighters is emphasized. Author

### F-14A LOW ALTITUDE, LOW AIRSPEED, HIGH ANGLE OF ATTACK ASYMMETRIC THRUST FLIGHT TEST PROGRAM

C. M. BAUCOM and C. CLARK (U.S. Navy, Naval Air Test Center, Patuxent River, MD) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 17-26.

The effect of asymmetric thrust (AT), due to single engine failure during low-speed, high-angle-of-attack (AOA) maneuvering, on F-14A high AOA flying qualities have been tested at low altitudes, using a F-14A No. IX highly modified aircraft with numerous special installations. Real-time F-14 simulation models, updated aerodynamic models for both the clean and external stores configurations, and a new TF30-P414A thrust model were implemented, and several low-speed aerodynamic coefficients were modified on the basis of previous flight-test results. In addition to the structured maneuvers, the effects of thrust asymmetry from both afterburner failure and full engine stalls while performing tactical fleet fighter maneuvers were tested. While AT alone did not produce disorienting departures, flight control departures could be easily induced when the uncommanded roll from thrust asymmetry was countered by natural sense lateral stick inputs away from roll. The AT contribution to such combined AT/flight control departures was the major cause of the subsequent yaw accelerations only at very high AOAs. I.S.

### AV-8B INITIAL SEA TRIALS

M. A. NYALKO and R. E. GRIMES (U.S. Navy, Naval Air Test Center, Patuxent River, MD) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 27-38.

Shored-based buildup tests, a laboratory simulation, and shipboard tests were conducted to evaluate the capabilities of the AV-8B aircraft model to operate from air-capable amphibious ships, and to compare these capabilities to those of the AV-8A aircraft. The aspects of the shipboard takeoff and landing performance, the launch and recovery techniques, the aircraft/ship interface, and the instrument approach profiles and procedures were investigated. All tests were conducted in the V/STOL configuration with gear down, ailerons dropped 15 deg, and flaps and nozzles interconnected. The tests have demonstrated an excellent capability of AV-8B to operate from a sea-based platform, with the STO performance gains of up to 42 percent increased over the AV-8A in mission payload, and an improvement of flying qualities in all flight regimes, resulting in greatly reduced pilot workload. Crosswind takeoff limitations were influenced entirely by ship's effects and were the same as those of the AV-8A. Approach profile testing to a 0.5 NM minimum showed that the AV-8B will be able to operate in all-weather conditions. I.S.

**A86-21056**

### PROGRESS REPORT - F-16 C&D TESTING

K. DWYER (General Dynamics Corp., Fort Worth, TX) and T. MESCHKO (USAF, Edwards AFB, CA) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 58-71.

The goals and some results of a three-stage F-16 Multinational Staged Improvement Program (MSIP) for the continued expansion of the F-16A/B aircraft capabilities are presented. As the ultimate goal, the future F-16C/D aircraft under development is intended to perform both the night, low-level, ground-attack missions and the all-weather, multi-target, air-to-air missions. Improved cockpit, new and improved avionics, airframe changes, and added weapon carriage are the major changes introduced during Stages I and II of the F-16 MSIP. The following systems are planned for incorporation into the F-16C/D aircraft during Stage III: the Low-Altitude Navigation and Targeting Infrared for Night system, which incorporates navigation and targeting forward looking infrared sensors and a terrain-following radar; the Advanced Medium-Range Air-to-Air Missile, as the beyond-visual-range weapon; the F-110 GE-100 engine, ASPJ equipment; the ALR-74 Radar Warning Set; the Global Positioning System; and the Precision Locator Strike System. I.S.

**A86-21057**

### F-20A TIGERSHARK PROGRESS REPORT

D. BARNES (Northrop Corp., Los Angeles, CA) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 75-100.

The progress of the F-20 flight test and marketing support efforts and of the basic F-20 design is reported. Three main topics are covered: (1) the aircraft characteristics, in particular the recently changed features, (2) selected recent flight test results, and (3) the customer demonstration and marketing-support activities. Among the special characteristics of the F-20A aircraft are an increased wing and flap area, an upgraded 18,000-lb production engine, integrated digital avionics, a first-flight-test instrument panel (FTIP) with a programmable digital display, and the second- and third-FTIP for avionics testing. The results of testing the airworthiness, the performance and flight qualities, and flight avionics performed in more than 910 test flights have verified the high degree of reliability, maintainability, and safety of the F-20A Tigershark aircraft. I.S.

**A86-21058**

### CONVENTIONAL TAKEOFF AND LANDING (CTOL) AIRPLANE SKI JUMP EVALUATION

C. P. SENN and T. A. WAGNER (U.S. Navy, Naval Air Test Center, Patuxent River, MD) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 101-117.

Ski-jump launching as an alternative to shipboard catapult launch for conventional takeoff and landing (CTOL) aircraft was evaluated by tests on an F/A-18A aircraft, using a pitch attitude-capture flyaway technique. Results of ground acceleration runs and high-angle-of-attack tests, dynamic single-engine flight characteristics, and definitions of aborted takeoff/committed to takeoff criteria are reported. In a total of 91 ski-jump launches, operated from both the 6 and 9 deg ramp, about 66 percent reduction in takeoff ground roll was obtained, compared to the normal ground takeoff. A ski-jump launch is an easier maneuver than a normal field takeoff. Any operational CTOL ski-jump aircraft should have a Head-Up Display, nosewheel steering, stability augmentation in all axes, and an accurate, repeatable flight control trim system. The general arrangement and dimensions of the test ski-jump equipment are included. I.S.

**A86-21059**

### NON-RIGID AIRSHIP TESTING

L. D. WHITMER and K. BEEKS IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 118-127.

The flying qualities and performance of a lighter-than-air aircraft, the Patrol Airship Concept Evaluation (PACE) test airship, designated AI-500, were evaluated. NASA's Ames, in conjunction with Systems Technology, provided the instrumentation for dynamic tests and propeller thrust measurements. The results indicate that the AI-500 has a potential for use in maritime patrol missions. However, the conventional control system is inadequate for long-endurance or heavy-weather missions due to high control forces in maneuvering flight, and a requirement for the pilot to continually monitor the controls to maintain proper altitude and heading alignment. The vectored thrust did provide a VTOL capability, but not an adequate rearward vector angle and lateral control in the hovering environment. An analysis indicated that these deficiencies were correctable. I.S.

**A86-21060**

### TESTING CANADIAN UNIQUE FEATURES OF THE CF-18 - THE FIRST YEAR

G. M. LACROIX (Aerospace Engineering Test Establishment, Canada) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 150-163.

The initial Weapons Clearing Program (WCP) of Canada's multirole CF-18 fighter was tested, including the 19 tube LAU-5003 rocket launcher and 2.75-in. CRV-7, the BL-755 cluster bomb, and the SUU-5003 training dispenser with four CRV-7's and six Modular Practice Bombs. The major program phases consisted of the flutter, flying qualities, cruise performance, the separation/jettison, and the rocket compatibility/accuracy tests. The results indicate that all objectives of the CF-18 initial WCP were achieved. Appropriate limits have been established to ensure the successful employment of the WCP weapons, and the follow-on testing has been identified to further enhance the capabilities of the CF-18. Diagrams of the CF-18 flutter test configurations, flying qualities test configurations, and the flutter analysis system are included. I.S.

**A86-21061**

### STRUCTURAL DEMONSTRATION OF THE AV-8B HARRIER II

J. C. JACKSON (McDonnell Aircraft Co., St. Louis, MO) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 164-175.

Structural demonstration of the AV-8B Harrier II, an aircraft that is 26 percent advanced composite material (graphite material filaments bonded together in a matrix of epoxy), and the results of the ground- and flying-tests are presented. The ground fatigue tests on the airframe had no failures, and the parts of the aircraft made from composite materials did extremely well. Five different configurations were tested in the flight test program, ranging from a clean aircraft to one carrying four 1000-lb bombs. The low-altitude and high-speed handling qualities of the aircraft were satisfactory. There were no major structural failures encountered nor load limits exceeded. A unique method of instrumentation was developed for this aircraft, in which the measurands were sandwiched in between layers of the composite materials as they were put together. The diagrams of the AV-8B aircraft, its control surface loads instrumentation, the test site communication system, as well as the structural demonstration points are included. I.S.

**A86-21062**

### PROBE AND DROGUE REFUELLING LARGE RECEIVER AIRCRAFT

J. A. BROWN (Aeroplane and Armament Experimental Establishment, Boscombe Down, England) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 176-190.

The probe- and-drogue refueling techniques of large fighter-type aircraft, practiced in the 1950's and 1960's and applied again during the Falklands' crisis, are reviewed. The trials method involved and the problems of performance (in particular, in cases when the envelope overlap is small, and the refueling must take place at altitudes below 10,000 ft, where the worst of the weather is found) are discussed in detail. Special attention is given to the aspects of handling a large receiver and the problems connected with pilot-induced oscillations and heavy controls (heavy ailerons, elevators, etc.) in the situations where lateral position must be controlled within 9 inches with minimal lateral motion at the time of contact. The effect of receiver's bow wave on the drogue is considered. Finally, the potential dangers of propellers in the C2, Transall, and C130 probe and drogue receivers are examined. A list of recommendations is given concerning characteristics and features of an ideal probe-and-drogue large receiver vehicle. I.S.

**A86-21063**

### ESCAPE SYSTEMS TESTING

J. B. MCDONALD and D. GRAGG (USAF, Holloman AFB, NM) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 191-206. refs

The escape system's (ES's) aspects of flight testing, in particular the problems encountered in the dynamic speed ranges above 600 KEAS, are presented. The development history of ES in the last 20 years led to the introduction of an encapsulated ES and the new Advanced Concept Ejection Seat (ACES)-II. Problems posed to the ESs by helicopter blades are considered. Special problems involved in high-speed escape (up to 700 KEAS), where human tolerance may be exceeded due to the explosive catapult charge, windblast, and acceleration, resulting in disabling spine injuries, are discussed. A new generation of ejection seats, introduced by an advanced development program, the Crew Escape Technology (CREST), is examined. The CREST seats will enable a safe escape at 700 KEAS, needing only 75 ft at 300 KEAS and a flight path angle of 30 deg, and will have advantageous restraining capability. In addition, a new concept in sled design, the Multi-Axis Seat Ejection Sled, is discussed. I.S.

### FLIGHT TESTING THE FIXED WING CONFIGURATION OF THE ROTOR SYSTEMS RESEARCH AIRCRAFT (RSRA)

G. W. HALL (NASA, Ames Research Center, Moffett Field, CA) and P. M. MORRIS (U.S. Army, Aeromechanics Laboratory, Moffett Field, CA) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 209-223. Previously announced in STAR as N85-34135.

The Rotor Systems Research Aircraft (RSRA) is a unique research aircraft designed to flight test advanced helicopter rotor system. Its principal flight test configuration is as a compound helicopter. The fixed wing configuration of the RSRA was primarily considered an energy fly-home mode in the event it became necessary to sever an unstable rotor system in flight. While it had always been planned to flight test the fixed wing configuraion, the selection of the RSRA as the flight test bed for the x-wing rotor accelerated this schedule. This paper discusses the build-up to, and the test of, the RSRA fixed wing configuration. It is written primarily from the test pilot's perspective. Author

**A86-21065**
**F-15 DUAL-ROLE FIGHTER FLIGHT TESTING**
D. C. SPENCER (USAF, Flight Test Center, Edwards AFB, CA) IN: Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-28, 1984, Proceedings . Lancaster, CA, Society of Experimental Test Pilots, 1984, p. 224-236.

A development test and evaluation effort on the F-15E Dual-Role Fighter (DRF) is reported. The F-15E, which as a derivative of the current F-15 aircraft, is a projected long-range aircraft for the air-to-ground (A/G) as well as the air-to-air (A/A) missions. The aspects of the F-15 derivative (equipped with Conformal Fuel Tanks and five-station weapon carriage), fighter evaluation, the scope of the testing, the performance results, specific flying qualities, and avionics evaluation are discussed. The improvements planned for the F-15E include an upgraded radar, programmable armament control set, and Advanced Medium-Range A/A Missile capability, as well as Low Altitude Navigation Infrared System for Night pods, HRR equipment, and expanded weapons capability. The crew station design has been reconfigured, to incorporate the state-of-the-art avionics, and tested successfully by a high-fidelity flight simulator. The flight tests have demonstrated that the F-15E DRF, while retaining the superior A/A capability of the F-15, will be capable of the deep strike/interdiction missions at night and/or under the weather. I.S.

**A86-21306**
**BASIC AIRCRAFT PERFORMANCE**
S. A. POWERS (Fairchild Republic Co., Conceptual Systems Development Directorate, Farmingdale, NY) Duxbury, MA, Kern International, Inc., 1984, 238 p.

A set of eight computer programs which can be used to generate accurate estimates of the performance of aircraft, both on prescribed missions and in maneuvering flight at prescribed conditions, is described. A sophisticated, state of the art drag prediction method, a thrust/fuel flow input and evaluation program, and a simple method of describing complex missions are included in the set of programs. With this computing system, it is possible to go from a three view drawing of an aircraft and a table of thrust/fuel flow data for the engine to a completed performance envelope and a mission performance description in two hours elapsed time. The use of each program is discussed, and an example of the use of each option is provided. The methods used in the programs are described, and each variable used is identified. C.D.

**A86-21712**
**SF-340 AIRFOIL STRUCTURE - A UNIQUE APPROACH**
P. V. OLIVA (Fairchild Republic Corp., Farmingdale, NY) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 116-124.

The major effort was directed at the fabrication process development for a generic aileron. Full size feasibility structural shells were produced and used to develop efficient fabrication techniques. These were utilized in the successful production of a generic monocoque shell. A complete aileron assembly was produced by installing hinge fittings and end ribs to the shell and the structure was subjected to static test. No discernible damage was detected at 150 percent of design ultimate load (225 percent of limit load) and the strain values were in excellent agreement with prediction. The hollow shell structure, which consists of an inner and outer graphite/epoxy face sheets sandwiched on a Nomex honeycomb core is shown. This new unique approach for an all composite aileron is currently in production on the commercial aircraft designated as the SF-340. Author

**DESIGNING AN AIRLIFTER - MCDONNELL DOUGLAS'S C-17**
R. DEMEIS Aerospace America (ISSN 0740-722X), vol. 24, Jan. 1986, p. 66-68, 70.

A design development history is presented for the C-17 military airlifter, whose performance requirements have been characterized as a synthesis of the external dimensions of the C-141B, the cargo capacity of the C-5, and the short/soft airfield operations capabilities of the C-130. Emphasis is given to the ground handling features of the C-17, whose cargo ramp can bear as great a load as the payload volume's main floor. Powered lift for STOL is effected through the direction of the four engines' exhausts onto the extended, double slotted flaps. Low life cycle costs were paramount in the course of C-17 design; for the first time, a military aircraft will be covered by warranties for reliability, maintainability, and mission completion. O.C.

**A86-22098#**
**F-14 RE-ENGINING WITH THE F110 ENGINE**
O. T. CASTELLS (General Electric Co., Evendale, OH) and J. T. STRONG, JR. (Grumman Aerospace Corp., Bethpage, NY) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 8 p.
(ASME PAPER 85-GT-184)

The advantages of re-engining the F-14 aircraft with the F110 engine is presented. The areas of improvement and the engine development philosophy are explained. A summary description of the pertinent engine design features of the F110 are presented. The flight test results on inlet/engine compatibility, afterburner operation, airplane performance, and maintainability/reliability/durability are interpreted. Finally, a description of the proposed version of the F110 engine for the F-14 is presented. Author

**A86-22112#**
**THE KC-135/CFM56 RE-ENGINE PROGRAM**
P. H. PACKER and M. P. GOODMAN (Boeing Military Airplane Co., Wichita, KS) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 6 p. refs
(ASME PAPER 85-GT-211)

This paper reviews the preliminary studies that led to the KC-135/CFM56 Re-Engine Program and discusses the motivation for re-engining an aircraft, designed in the mid 1950s, with a modern high bypass turbofan. The selected engine, the CFM56-2B-1. The other major aircraft modifications are described. The KC-135R test program methods and results are addressed with particular attention given to engine and aircraft performance. The overall benefits of the program relating to mission capability, environmental impact, and cost are also presented. Author

**A86-22127#**
**THE F-16 COMMON ENGINE BAY**
C. E. PORCHER ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 8 p.
(ASME PAPER 85-GT-231)

The aircraft-engine interfaces of the F-16 fighter's Common Engine Bay (CEB) are compatible with the current F100-PW-200 engine or either of the F110-GE-100 and F100-PW-220 engines of the U.S. Air Force's Alternate Fighter Engine competition. Simple kits allow changes among any of these three engines to be made in the field. Attention is presently given to the concept development history and program management aspects of the CEB, as well as the design features and control requirements of engine installation. O.C.

**A86-22131#**
**XB-70 STRUCTURES AND MATERIALS ADVANCEMENTS**
L. M. LACKMAN (Rockwell International Corp., El Segundo, CA) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 3-1 to 3-13. refs

The XB-70 was developed in the late 1950's. It was designed for intercontinental range at a sustained Mach 3 flight velocity while flying at an operational altitude of 70,000 feet. This environment required the establishment of many new criteria for structural design. Demanding and expansive structures/materials developments were vital in attaining the design goals. The structural configuration employed and its analysis and testing is presented.

The development of brazed steel honeycomb sandwich for use in shells and wing structures is described. New corrosion-resistant steel and titanium alloys were developed and are reviewed. The application of welded butt joints in steel honeycomb is discussed. The contributions of the XB-70 to the structural design of the following generation of high-speed aircraft are covered. Author

**A86-22132#**
**STRUCTURAL EVOLUTION B-58 TO F-16**
E. M. PETRUSHKA and J. W. MORROW (General Dynamics Corp., Fort Worth, TX) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 4-1 to 4-6.

The evolution from the B-58 'bonded bomber', where extreme emphasis was placed on structural performance, to the F-16 aircraft, based on the USAF Aircraft Structural Integrity program philosophy, is described. A transitional stage between these two aircraft designs is represented by the F-111, which utilized high-strength materials and bonded structure technology and in which the original steel design as augmented with a boron doubler, which reduced stress levels in wing pivot fittings. The F-16 is the first USAF aircraft to be designed, from the start, to meet durability and damage tolerance requirements under the acceptance methods of MIL-STD-1530A. The paper includes structure diagrams and design specifications of F-16 aircraft features. I.S.

**A86-22133#**
**STARSHIP 1**
E. H. HOOPER (Beech Aircraft Corp., Wichita, KS) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 6-1 to 6-6.

The application of advanced composite materials in the construction of the Beechcraft Starship I is reviewed. The material systems utilized are described as are the specific structural concepts for typical airframe components. The paper discusses the manufacturing processes briefly. Author

**A86-22165#**
**A CASE STUDY IN FATIGUE LIFE EXTENSION - THE MAIN SPAR OF RAAF MIRAGE IIIO WINGS**
J. Y. MANN (Department of Defence, Aeronautical Research Laboratories, Melbourne, Australia) and K. J. KENNEDY (Commenwealth Aircraft Corp., Ltd., Melbourne, Australia) Institution of Engineers , Mechanical Engineering Transactions (ISSN 0727-7369), vol. ME10, July 1985, p. 90-97. refs

The operation of the Australian and Swiss Air Forces' Mirage III aircraft beyond their original fatigue design or certification lives, without increasing the risk of structural failure, prompted a fatigue life extension program whose task was complicated by the discovery of fatigue cracks at the bolt holes of the wings' main spar. A comprehensive fatigue testing program was undertaken to extend the wings' service life on the basis of interference-fit bushes. The net cost savings of this program, which extended to inspection, manufacturing and installation procedures, represented savings of about $19 million Australian by comparison with the alternative of purchase of new wings from the manufacturer. O.C.

**A86-22261**
**CANARD MIRAGE ON TEST**
W. SPYCHIGER (Swiss Defence Technology and Procurement Agency, Switzerland) Flight International (ISSN 0015-3710), vol. 128, Dec. 14, 1985, p. 38-40.

A flight test program is being conducted by the Swiss Air Force to determine whether nose strake/canard control surface additions to its fleet of Mirage IIIs are a cost-effective means of extending high angle of attack maneuverability, and therefore of allowing retention of the Mirage III through the 1990s. Attention is given to gun firing certification test results for aircraft of this type with and without canards and strakes, as well as to experience with Sidewinder missile separation tests. A small canard is used which requires no airframe structural modification. Low speed maneuverability and instantaneous turn rate are significantly improved by canards. O.C.

**A86-22262**
**OLD FIGHTERS - NEW TARGETS**
J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 6, Jan. 1986, p. 4-8.

Full scale target drones derived from mothballed combat aircraft by means of a conversion program that furnishes continuous remote control, destruct, smoke emission visual acquisition and target scoring systems provide the most realistic training of combat pilots for confrontation with prospective threats. F-86, T-33, and F-104 single seat aircraft, as well as B-47 bombers, have been employed in this capacity. Attention is presently given to the conversion process to which F-100 fighters are subjected, and their remote control system's architecture. O.C.

**EXPLORING THE UNKNOWN WITH UNMANNED AIRCRAFT**
J. H. BRAHNEY Aerospace Engineering (ISSN 0736-2536), vol. 6, Jan. 1986, p. 22-27.

An evaluation is made of the operational and economic rationales for the use of remotely piloted research vehicles (RPRVs) in the study of novel aerodynamaic configurations and flight control techniques. These 'undersize' aircraft can be manufactured for a fraction of the cost of a full sized, piloted research vehicle, and can be used to obtain high quality flight test data in extreme portions of the given flight envelope without endangering a test pilot. High-G maneuvering beyong the limits of human tolerance can therefore be routinely studied by an RPRV such as the Highly Maneuverable Aircraft Technology vehicle. Spin phenomenon research and oblique wing RPRVs have also been successfully employed. O.C.

**AV-8B DESIGN FOR MAINTAINABILITY**
R. J. ANDERSON (McDonnell Aircraft Co., St. Louis, MO) IN: Annual Reliability and Maintainability Symposium, Philadelphia, PA, January 22-24, 1985, Proceedings . New York, Institute of Electrical and Electronics Engineers, 1985, p. 28-33.

Methods, procedures, and design features used to create a maintainable and effective AV-8B light attack Vertical/Short Takeoff and Landing (V/STOL) aircraft for operations from all classes of carriers, VTOL ships/sea platforms, shore bases, and forward sites are identified. A comparison with AV-8A, stressing areas of improvement, is made. The AV-8B maintainability requirements are given along with the highlights of efforts to meet those requirements. The use of high yield technology in the AV-8B is discussed, as are improvements in structure, the landing gear system, the fuel system, and the armament system. The results of Maintenance Engineering Inspection and of Full Scale Development Evaluation are described. C.D.

**F/A-18 HORNET - RELIABILITY DEVELOPMENT TESTING**
W. R. ROGGER (McDonnell Aircraft Co., St. Louis, MO) IN: Annual Reliability and Maintainability Symposium, Philadelphia, PA, January 22-24, 1985, Proceedings . New York, Institute of Electrical and Electronics Engineers, 1985, p. 373-378.

The F/A-18 reliability program established reliability development testing (RDT) as a firm requirement. The F/A-18 dedicated RDT had the objective to improve future hardware reliability by timely identification of problems and verification of corrective actions. The Operational Mission Environment (OME) was converted to extreme conditions during RDT to accelerate failure mechanisms without inducing nonrepresentative failure modes. It is pointed out that the original F/A-18 requirements specified that reliability development tests for avionics be conducted on all customer furnished equipment (CFE). Attention is given to details regarding the F/A-18 Avionic Equipment Reliability Test, OME study results, test environments, application to preplanned product improvement, and lessons learned in connection with the F/A-18 RDT. **FATIGUE LIFE MONITORING OF AIRCRAFT**
J. B. DEJONGE 27 Oct. 1983 10 p In DUTCH; ENGLISH summary Presented at Netherlands Association of Aeronautical Engineers, 1 Dec. 1983
(NLR-MP-83069-U; B8568105) Avail: NTIS HC A02/MF A01

Methods for monitoring fatigue loads on aircraft structures are presented. As the actual service life deviates appreciably from design load spectrum assumptions, a reassessment of safe service life and inspection schedules are shown to be necessary. Simple counting accelerometer systems; multiparameter recording systems; and direct strain monitoring systems are discussed. Examples of combat aircraft and civil transport aircraft are presented. The interpretation of recorded loads in terms of accumulated fatigue damage is considered. Author (ESA)

**AIRWORTHINESS FLIGHT TEST PROGRAM OF AN AIRCRAFT EQUIPMENT FAIRING**
V. R. MILLER and T. P. SEVERYN (4950th Test Wing, Wright-Patterson AFB, Ohio) *In* Shock and Vibration Information Center The Shock and Vibration Bulletin 55, Part 2 p 69-75 Jun. 1985 refs
Avail: SVIC, Code 5804, Naval Research Lab., Washington, D.C. 20375 CSCL 01C

The results of an airworthiness flight test program of an aircraft equipment fairing are given. The objective of the tests was to insure the airworthiness of the aircraft with the installed fairing. The tests were conducted to determine the structural integrity of the modifications and their effects on the aircraft handling qualities. The tests were extended to allow more detailed data acquisition and analysis due to the problems encountered with flow separation, aerodynamic buffeting and noise-induced fatigue. The test indicated that the airspeed envelope of the aircraft be restricted while the fairing was installed, and that structural modifications to portions of the aircraft be made. Rigid inspection requirements were levied after each flight to detect any structural damage. Author

**APPLICATION OF COMPUTATIONAL AERODYNAMICS TO WING DESIGN**
M. MAKADATE *In* National Aerospace Lab. Proceedings of the 2nd NAL Symposium on Aircraft Computational Aerodynamics p 271-278 1984 refs In JAPANESE; ENGLISH summary
Avail: NTIS HC A14/MF A01

Recent progress in Computational Aerodynamics has enabled the engineers of aircraft manufacturers to utilize transonic aerodynamic analysis programs in designing wings. Effectiveness of control surfaces (spoiler, aileron), which is greatly influenced by the characteristics of the wing, is an important problem. This paper introduces application of transonic aerodynamic analysis programs to the computation of control surface effectiveness. B.W.

**A NUMERICAL SOLUTION OF THE TRANSONIC INTEGRAL EQUATION AND ITS APPLICATION TO THREE-DIMENSIONAL TRANSONIC WING DESIGN**
S. TAKANASHI *In its* Proceedings of the 2nd NAL Symposium on Aircraft Computational Aerodynamics p 279-292 1984 refs In JAPANESE; ENGLISH summary
Avail: NTIS HC A14/MF A01

A numerical solution of the transonic integral equations is presented for three-dimensional transonic wing design. The objective of the design problem is to determine the wing geometry which realizes a prescribed pressure distribution on the wing surface. This boundary value problem can be formulated by the transonic integral equations with artificial viscosity terms. The resulting integral equations are simplified by introducing an approximate function for the space velocity distribution which reduces the three-dimensional problem to a two-dimensional one. The uniqueness of solution is guaranteed by imposing an additional condition, i.e., the closure condition at the trailing edge. To facilitate numerical evaluation of the definite integrals the wing surface is divided into a number of small rectangular panels. As a result, the singular integral equations are converted to a system of linear equations which can easily be solved by standard numerical techniques. An extension of the integral equation method to more general and versatile design procedure is described, and some of the design results for a transonic sweptback wing with an isobar pattern are also presented. **A WING DESIGN BASED ON THE THREE-DIMENSIONAL TRANSONIC INVERSE METHOD AND THE COMPARISON WITH THE WIND TUNNEL TESTING DATA**
S. TATSUMI and S. TAKANASHI *In* National Aerospace Lab. Proceedings of the 2nd NAL Symposium on Aircraft Computational Aerodynamics p 293-304 1984 refs In JAPANESE; ENGLISH summary
Avail: NTIS HC A14/MF A01

Along with the recent progress in computational aerodynamics, aircraft designers have paid great attention to inverse methods. Inverse methods, which determine wing geometries under prescribed target pressure distributions, are considered important design techniques because of the applicabilities of experience and knowledge of aircraft designers. Although several two-dimensional methods have already been established, there exist only a few reports about three-dimensional transonic inverse methods, and the three-dimensional technique has not been established yet. This report describes wing design by the three-dimensional transonic inverse method using the integral equation formulation which was developed by one of the authors. The method has the great advantage that various flow-solvers can be applied. Also wind tunnel testing was conducted with the design wing to investigate the capability of the method. The comparison of design and test results shows a good agreement and the method proves to be very effective in three-dimensional transonic wind design. Author

Recent research on advanced-configuration commercial aircraft at DFVLR is surveyed, with a focus on aerodynamic approaches to improved performance. Topics examined include transonic wings with variable camber or shock/boundary-layer control, wings with reduced friction drag or laminarized flow, prop-fan propulsion, and unusual configurations or wing profiles. Drawings, diagrams, and graphs of predicted performance are provided, and the need for extensive development efforts using powerful computer facilities, high-speed and low-speed wind tunnels, and flight tests of models (mounted on specially designed carrier aircraft) is indicated. **STRATEGIES FOR DYNAMIC MODELING OF A HELICOPTER STRUCTURE**

S. DURAND and V. YANA 1985 12 p refs Presented at 11th European Rotorcraft Forum, London, England, 10-13 Sep. 1985
(SNIAS-852-210-101) Avail: NTIS HC A02/MF A01

Helicopter dynamic modeling problems are studied using three principles: divide difficulties, correlate with test and simplify reality. The analytical procedures that were used include the finite element method, modal analysis, harmonic analysis and transient analysis. The method is applied to the tail section of the Ecureil helicopter. Good correlation between natural frequency modes as measured and calculated is obtained over nine vibrating modes. The forced response calculations allowed to find a solution to a problem of unbalance excitation caused by the tail rotor. Author (ESA)

**LASER SYSTEMS FOR USE WITH AIRBORNE PLATFORMS**

J. JEPSKY (Associated Controls and Communications, Inc., Salem, MA) IN: The National Symposium and Workshop on Optical Platforms, Huntsville, AL, June 12-14, 1984, Proceedings . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 435-442.

The use of pulsed gallium arsenide and yttrium-aluminum-garnet laser systems for profiling, altimetry, photogrammetric control, collision avoidance, and shipboard landing systems is examined. Laser transmitters operate at pulse rates up to 4 KHz, at peak power outputs up to 100 watts, and a 10-50 nanosecond pulse width. The techniques utilized by the rangefinders for the measurement circuitry are discussed. In order to evaluate the accuracy of the range measurements the signal-to-noise ratio is calculated. Operation of the laser system for profiling, with a control console and a single board computer is analyzed. Examples of profiles obtained using the laser system are presented. The SKEET Delivery System and the SKEET Delivery Vehicle Assembly are described. I.F.

**THE CA-810 - A MODERN TRI-LENS CAMERA**

G. LEWIS (Recon/Optical, Inc., Barrington, IL) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellinghem, WA, SPIE - The International Society for Optical Engineering, 1984, p. 6-12.

Advances in electronic technology have allowed the camera designer more latitude in choosing how each camera function is to be performed. This paper describes the CA-810 camera design, showing how modern technology allows the configuration of a camera to meet both high airborne performance and reliability. The CA-810 camera uses three 80-mm, f/2.0 lenses and two prisms to provide over 140 deg across the line of flight by 47 deg in the line of flight coverage. It is similar in general arrangement to the KA-63 camera produced in 1963. The CA-810 camera is capable of operation at cycle rates up to 12.6 frames/s. Results of tests on the CA-810 camera are vgiven, demonstrating the effectiveness of the use of modern technology in the design of a new low altitude, high cycle rate camera. Author

### PC-183B STANDOFF IMAGING SYSTEM

H. J. FREDRICKSON (Itek Corp., Optical Systems Div., Lexington, MA) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 13-18.

Itek has recently completed a program to supply long range oblique photography (LOROP) cameras for a nose installation in an F-104 aircraft. The camera, designated PC-183B, is a derivative of a configuration presented at the June 1980 SPIE show. The PC-183B camera features reflective optics, internal two-axis stabilization, and a unique air capstan. Author

**A86-19580**

### APPLICATION OF BIOCULAR VIEWERS TO AIRBORNE RECONNAISSANCE

H. G. ELDERING (Baird Corp., Government Systems Div., Bedford, MA) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 27-30.

Biocular viewers permit magnification of small areas without optical distortion and produce an image that can be viewed with both eyes. Current applications range from biocular viewing of driftsights, image intensifiers, or FLIR displays while in a moving vehicle, to quick scanning of reconnaissance imagery in ground based photointerpreter facilities. Other potential applications include allowing the use of space-saving devices available only in small formats, such as liquid crystal video displays. Advantages include absence of facial contact, no diopter adjustment necessary, operator may wear glasses incorporating astigmatic corrections, and wide angle viewing (45-deg field of view) to allow correct perspective presentation. The lack of distortion reduces eye fatigue and reduces the likelihood of nausea while viewing in an unstable environment. Distortion inherent in certain image intensifier tubes can be partially corrected with a biocular viewer. Author

**A86-19581**

### KA-102 FILM/EO STANDOFF SYSTEM

R. T. TURPIN (Itek Corp., Optical Systems Div., Lexington, MA) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 31-41.

An assessment is made of the design features and performance capabilities of the KA-102 airborne reconnaissance camera, which possesses a film-or-electrooptic (EO) selection feature and is coupled to a real time data link. The EO focal plane is a continuous line array of 10,240 CCD elements operating in the 'pushbroom' mode. EO imagery can be transmitted up to 500 nm at 75 Mbit/sec. At the ground station, the imagery is calibrated and displayed in real time on three CRTs; image enhancement and magnification for detailed study may be undertaken, as well. O.C.

**A86-19583**

### KS-146A CAMERA DEVELOPMENT AND FLIGHT TEST RESULTS

T. AUGUSTYN (Recon/Optical, Inc., Barrington, IL) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 50-55.

In 1979, there began the development of the KS-146 A 1676-mm focal length, f/5.6 frame camera system designed exclusively for long range oblique photographic missions. The goal was to produce a stabilized system tailored for use with relatively slow, but high-definition films such as EK 3412 and 3414, while also providing growth potential to an electro-optical (E-O) real-time sensor. A detailed design description of the system was presented in 1981. Since then, six systems have been fabricated, evaluated and flight tested over a wide range of airborne conditions. All systems are now operational and the results obtained have confirmed that all objectives have been achieved. Airborne resolution of 8.5 microrad has consistently been demonstrated at slant ranges exceeding 30 n mi. Modular construction, and the flexibility inherent in the KS-146A design, makes the conversion to an E-O sensor straightforward, and the effort to expand the capabilities of the system have begun. Details of the camera development and a review of flight test results are presented. The modification to convert the system to near real time are also discussed. Author

**A86-19585**

### A NEW GENERATION ADVANCED I.R. LINESCAN SENSOR SYSTEM

D. B. DUKE, G. B. MCQUEEN, and P. V. ADAMS (British Aerospace, PLC, Dynamics Group, Hatfield, England) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 61-70.

One of an advanced generation of infrared Linescan Sensors with superior performance, small size, and low weight is described. These systems provide horizon to horizon across-track coverage which, coupled with electronic roll stabilization, provides a far greater probability of target detection than earlier systems. The optics, detector, cooling system, and electronics of the sensor are described, as are the three Line Replaceable Units in the system. C.D

**A86-19586**

### EVOLUTION OF REAL TIME AIRBORNE RECONNAISSANCE

W. J. UTTLEY-MOORE, R. CAREW-JONES, T. MORGAN, P. J. WILLIAMS, and R. C. RANKIN (Computing Devices Co., St. Leonards-on-Sea, England) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 71-78.

An outline of the requirements for a modern reconnaissance system as fitted to a tactical strike aircraft is presented. Film based reconnaissance systtems, as used in many existing installations, are discussed with emphasis on their failure to meet many of the requirements. Systems providing aircrew with immediate access to sensor data are discussed. Particular emphasis is given to the Panavia Tornado RMS 3000 system utilizing video tape and cockpit imagery. A basic ground station whihc could be used with the RMS 3000 system is discussed, stressing the wide range of facilities provided. The paper concludes with some future possibilities for this type of system. Author

### COMPUTER CONTROLLED OPERATION OF RECONNAISSANCE CAMERAS

R. LYON, A. BIENER, and F. PALAZZO (Fairchild Weston Systems, Inc., Syosset, NY) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 79-81.

Reconnaissance cameras are now controlled by real-time computer/microprocessor systems. The processor may control the camera stabilization and scanning, autofocus, exposure control and data annotation functions. Operator interface may be minimal with a simple control panel or quite extensive with sophisticated display/keypad subsystems. Target selection may be controlled by an operator or the camera may be automatically driven by the processor system using a predetermined mission profile updated by aircraft flight data. Author

### AUTOMATIC EXPOSURE CONTROL EMPLOYING SCENE STATISTICS IN RECONNAISSANCE CAMERAS

R. LYON (Fairchild Weston Systems, Inc., Syosset, NY) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 82-84.

A method is described for modifying the exposure value in aerial reconnaissance using an automatic process which discriminates against nonrelevant information. A microprocessor is used to determine the best exposure value based on scene statistics. Brightness data are obtained from a 'look-ahead' CCD sensor, and scene statistics are computed and processed using an exposure control algorithm. The use of the hardware employed in this method is described. C.D.

### CAMERA FLIGHT TESTS AND IMAGE EVALUATION

U. J. V. RINGH (Forsvaret Materielverk, Linkoping, Sweden) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 94-100. refs

This paper describes camera flight tests and image evaluation for conventional cameras as they are carried out by the Swedish Defense Material Administration (FMV). The image evaluation method used is resolving power by use of three bar target. A special square target (4 x 4 m) is also used to measure contrast ratio on the film with a microdensitometer. Results of contrast measurements are given from tests carried out in good weather conditions with a horizontal visibility of more than 30 km. The measured contrast ratios and theoretical predicted values have been compared. The model used for this prediction of atmospheric contrast reduction is compiled from known literature. The comparison shows that the model used for the prediction was usable. Author

### SENSOR CONTROL AND FILM ANNOTATION FOR LONG RANGE, STANDOFF RECONNAISSANCE

T. G. SCHMIDT, O. L. PETERS, and L. H. POST (McDonnell Douglas Electronics Co., St. Charles, MO) IN: Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 134-141.

This paper describes a Reconnaissance Data Annotation System that incorporates off-the-shelf technology and system designs providing a high degree of adaptability and interoperability to satisfy future reconnaissance data requirements. The history of data annotation for reconnaissance is reviewed in order to provide the base from which future developments can be assessed and technical risks minimized. The system described will accommodate new developments in recording heat assemblies and the incorporation of advanced cameras of both the film and electro-optical type. Use of microprocessor control and digital bus interface form the central design philosophy. For long range, high altitude, standoff missions, the Data Annotation System computes the projected latitude and longitude of central target position from aircraft position and attitude. This complements the use of longer ranges and high altitudes for reconnaissance missions. Author

### AIR TARGETING OF THE THIRD KIND - AIRBORNE VEHICLES

J. F. GILMORE (Georgia Institute of Technology, Atlanta) IN: Applications of digital image processing VII; Proceedings of the Meeting, San Diego, CA, August 21-24, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 330-340. refs

The majority of research in the area of image analysis over the last several years has centered on ground-based object and region analysis. Recent events have stirred an interest in the detection and classification of aircraft in flight. This paper surveys the six algorithms which have been successful applied to the problem of aircraft classification. Each algorithm is analyzed in terms of relative strengths and weaknesses. Summary results of the filter operators, aircraft types, evaluation imagery, problems addressed, and algorithm assumptions are presented for each approach considered. Author

### TOWARDS ROBUST IMAGE MATCHING ALGORITHMS

T. J. PARSONS (British Aerospace, PLC, Dynamics Group, Hatfield, England) IN: Applications of digital image processing VII: Proceedings of the Meeting, San Diego, CA, August 21-24, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 436-444. refs

An effort to develop a robust image matching system suitable for use in an automatic image matching navigation system with a thermal IR sensor is reported. First, the requirements for an image matching algorithm are formulated, and the image data-base used in the study is described. An overview is then presented of a suggested image processing based navigation system, with attention given to preprocessing, processing, feature extraction, and to the Scene Matching by Area Correlation system. It is shown that the best edge maps for a wide variety of images are obtained by looking for edge crossing in a D.O.G. (Difference of Gaussian) convolved image significantly above the noise level. Finally, the use of techniques based on relational graphs in developing a robust image matching algorithm and the concept of the Problem Based Language Extension are briefly reviewed. V.L.

### DESCRIPTION OF AND RESULTS FROM CAMERA SYSTEMS FOR RECORDING DAYTIME LIGHTNING STRIKES TO AN AIRPLANE IN FLIGHT

P. W. BROWN (NASA, Langley Research Center, Hampton, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 14 p.

(AIAA PAPER 84-0020)

Photographic still and movie and video camera systems have been developed to reveal more about the characteristics of daytime lightning strikes to airplanes in flight. Equipment selection and design is particularly important with regard to time of event occurrence, time correlation between cameras, rapidity of actuation, ease of photogrammetric analysis, and selection of fields of view. The most recent such camera systems flown in an NASA F-106B research airplane are described and design considerations are discussed. Daytime depictions of lightning strikes are presented as illustrative of some of these considerations. Author

### DEVELOPMENT OF A KNOWLEDGE ACQUISITION TOOL FOR AN EXPERT SYSTEM FLIGHT STATUS MONITOR

J. D. DISBROW (Systems Control Technology, Inc., Palo Alto, CA), E. L. DUKE, and V. A. REGENIE (NASA, Flight Research Center, Edwards, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. refs

(AIAA PAPER 86-0240)

Two of the main issues in artificial intelligence today are knowledge acquisition and knowledge representation. The Dryden Flight Research Facility of NASA's Ames Research Center is presently involved in the design and implementation of an expert system flight status monitor that will provide expertise and knowledge to aid the flight systems engineer in monitoring today's advanced high-performance aircraft. The flight status monitor can be divided into two sections: the expert system itself and the knowledge acquisition tool. This paper discusses the knowledge acquisition tool, the means it uses to extract knowledge from the domain expert, and how that knowledge is represented for computer use. An actual aircraft system has been codified by this tool with great success. Future real-time use of the expert system has been facilitated by using the knowledge acquisition tool to easily generate a logically consistent and complete knowledge base. Author

### DEVELOPMENT OF AN AIRBORNE CCD SCANNER FOR LAND AND SEA APPLICATIONS

N. J. J. BUNNIK, H. POUWELS, L. AARTMAN, P. BINNENKADE (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands), C. SMORENBURG (Centrale Organisatie voor Toegepast-Natuurwetenschappelijk Onderzoek, Technisch Physische Dienst TNO, Delft, Netherlands) et al. IN: International Symposium on Remote Sensing of Environment, 18th, Paris, France, October 1-5, 1984, Proceedings. Volume 2 . Ann Arbor, MI, Environmental Research Institute of Michigan, 1985, p. 713-721.

An airborne multispectral scanner based on the use of CCD detector arrays has been developed. The device is known as CAESAR (CCD Airborne Experimental Scanner for Applications in Remote sensing). The CAESAR project has mainly the objective to increase Dutch experience with respect to the application of CCD detectors for earth observation, giving particular attention to the exploration of the technical problem areas associated with the use of CCD detectors. A second objective is related to the stimulation of application-oriented research in the use of multispectral data for land and sea observation by means of a versatile system specified by existing user requirements. After the development and test phase, the project will be continued with an application-oriented evaluation phase to be executed in 1985. The present article provides a description of the user specifications, the design of the sensor system, and the onboard data handling system. Attention is given to the first results of flight tests conducted in July 1984. G.R.

### UNITED STATES COAST GUARD ACQUISITION OF REMOTE SENSING CAPABILITY FOR OCEAN SURVEILLANCE

J. R. WHITE (USCG, Washington, DC) IN: International Symposium on Remote Sensing of Environment, 18th, Paris, France, October 1-5, 1984, Proceedings. Volume 3 . Ann Arbor, MI, Environmental Research Institute of Michigan, 1985, p. 1605-1615.

An account is given of the U.S. Coast Guard development of an airborne, real-time, all-weather, day/night remote sensing system that will detect oil slicks at sea and identify violating vessels. The system has been designated 'Aireye' and will be installed on six of the 41 new Falcon 20 G jet aircraft (military designation HU-25A) which the Coast Guard has recently purchased as its medium range surveillance aircraft. The sensor system will include a side-looking airborne radar, three channel IR/UV line scanner, aerial reconnaissance camera, airborne data annotation system, and a control-display-record console. An active gated television camera will be used to identify vessels at night. D.H.

### ANALYSIS OF THE F/A-18 HORNET FLIGHT CONTROL COMPUTER FIELD MEAN TIME BETWEEN FAILURE

P. GRIFFIN (General Electric Co., Aerospace Control Systems Dept., Binghamton, NY) IN: Annual Reliability and Maintainability Symposium, Philadelphia, PA, January 22-24, 1985, Proceedings . New York, Institute of Electrical and Electronics Engineers, 1985, p. 108-114.

The F/A-18 FCSE (Flight Control System Electronics) is a four channel (quad redundant) digital fly-by-wire system contained in nine Weapon Replaceable Assemblies (WRA's). The system is built by an American aerospace company. The present paper is concerned with the Flight Control Computer (FCC) which is the heart of the quad configuration for the FCSE. Each computer contains dual channels. Included in the conducted analysis are 131 relevant failures for a total of 62,769 aircraft operating hours, or 125,538 FCC operating hours. The field experienced MTBF (Mean Time Between Failure) of 958 is compared against the predicted MTBF of 851. Attention is given to problems arising in connection with reliability predictions, reliability planning and management philosophy, part type failure distribution, reliability prediction based on updated integrated circuit junction temperatures, and the IC environmental duty cycle. G.R.

### FINDS: A FAULT INFERRING NONLINEAR DETECTION SYSTEM PROGRAMMERS MANUAL, VERSION 3.0

R. E. LANCRAFT Dec. 1985 174 p refs
(Contract NAS1-16579)
(NASA-CR-177986; NAS 1.26:177986; REPT-6012) Avail: NTIS HC A08/MF A01 CSCL 01D

Detailed software documentation of the digital computer program FINDS (Fault Inferring Nonlinear Detection System) Version 3.0 is provided. FINDS is a highly modular and extensible computer program designed to monitor and detect sensor failures, while at the same time providing reliable state estimates. In this version of the program the FINDS methodology is used to detect, isolate, and compensate for failures in simulated avionics sensors used by the Advanced Transport Operating Systems (ATOPS) Transport System Research Vehicle (TSRV) in a Microwave Landing System (MLS) environment. It is intended that this report serve as a programmers guide to aid in the maintenance, modification, and revision of the FINDS software. Author

### STRESS LEVEL TESTING OF ELECTRONICS, AVIONICS COMMUNICATIONS AND C3I EQUIPMENTS Final Report

30 Aug. 1985 28 p
(AD-A159395; TOP-6-1-002) Avail: NTIS HC A03/MF A01 CSCL 17B

This Test Operations Procedure (TOP) describes test methods and techniques for measuring and evaluating the technical performance of a System Under Test (SUT) when the SUT is operated to and beyond specifications in order to determine its response to high levels of stimuli. The extremely short period allowed for the writing of this TOP along with the great diversity of potential systems to be tested has precluded the writing of a document which conclusively covers the topic of stress level testing. This document should be considered as a TOP which outlines the basic requirements and the basic test methodology for conducting stress level testing. This TOP includes only the electronics aspect of stress level testing. It does not consider the classical environmental and mechanical stress testing of materials; these types of stress testing are covered in MIL-STD-810D. GRA

**DESIGN AND EVALUATION OF AN INSTRUMENTATION SYSTEM FOR MEASUREMENTS IN NONSTEADY SYMMETRICAL FLIGHT CONDITIONS WITH THE HAWKER HUNTER MK 7**

K. VANWOERKOM 1984 83 p refs

(VTH-LR-308) Avail: NTIS HC A05/MF A01

A flight test instrumentation system with a sample of rate 400 measurements/sec, and 0.02% overall accuracy is described. The system was used to perform nonsteady symmetric flight tests with a Hawker Hunter aircraft. The design and evaluation of transducers, signal conditioning, and the data collection system are outlined. The program demonstrates the technique of measuring performance characteristics as well as stability and control characteristics simultaneously in dynamic flight conditions. Author (ESA)

**ERROR PROPAGATION IN A DIGITAL AVIONIC PROCESSOR: A SIMULATION-BASED STUDY**

D. LOMELINO and R. K. IYER 1986 39 p refs

(Contract NAG1-613)

(NASA-CR-176501; NAS 1.26:176501) Avail: NTIS HC A03/MF A01 CSCL 01D

An experimental analysis to study error propagation from the gate to the chip level is described. The target system is the CPU in the Bendix BDX-930, an avionic miniprocessor. Error activity data for the study was collected via a gate-level simulation. A family of distributions to characterize the error propagation, both within the chip and at the pins, was then generated. Based on these distributions, measures of error propagation and severity were defined. The analysis quantifies the dependency of the measured error propagation on the location of the fault and the type of instruction/microinstruction executed. Author

**DEVELOPMENT OF A PIEZOELECTRIC QUARTZ PRESSURE SENSOR FOR AVIONICS WITH EXCELLENT LONG TERM STABILITY (WITH FINAL DEMONSTRATION OF THE RESULTS ON A PROTOTYPE) Final Report, Nov. 1984**

M. R. RISCH Bonn, West Germany Bundesministerium fuer Forschung und Technologie Aug. 1985 72 p refs In GERMAN; ENGLISH summary Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn, West Germany

(BMFT-FB-W-85-010; ISSN-0170-1339) Avail: NTIS HC A04/MF A01; Fachinformationszentrum, Karlsruhe, West Germany DM 15

An accurate, stable pressure sensor was developed for avionics using quartz as a pressure-sensitive element, a copper-beryllium beam balance for pressure transfer, calculators for digitization, and two identical high frequency piezoelectric surface wave resonators for improved accuracy. Sensor pressure and temperature dependence were tested. Pressure sensitivity changes with temperature, at 0.05% per C. As errors are 0.1% for hysteresis, repeatibility, temperature hysteresis, and long term drift, the pressure sensor can be mass produced. Nonlinearity and temperature dependence are 1% but can be compensated with a microprocessor. Author (ESA)

**RELIABILITY ASPECTS OF SOFTWARE FOR DIGITAL AVIONICS**

G. J. DEKKER 1985 95 p refs Revised

(Contract RB-RLB-1982-1-3.3)

(NLR-TR-82126-U; B8568394) Avail: NTIS HC A05/MF A01

Methods to develop reliable software based avionics systems, especially for safety critical functions, are reviewed. The differences between analog and digital systems, and the policy of the FAA to certify software based systems are presented. Methods to minimize the number of errors during software development, methods to remove as many errors as possible via testing, and methods to minimize the effect of remaining errors during operational flights are outlined. A safety analysis regarding common-mode failures is given. Reliability related techniques used by avionics manufacturers are discussed. Author (ESA)

**AN EXPERIMENTAL INVESTIGATION OF PROPELLER WAKES USING A LASER DOPPLER VELOCIMETER**

R. M. SUNDAR (Embry-Riddle Aeronautical University, Prescott, AZ) and J. P. SULLIVAN (Purdue University, West Lafayette, IN) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 7 p.

(Contract NSG-3135)

(AIAA PAPER 86-0080)

The results of experimental investigations on three single rotation propellers are summarized in this paper. Force measurements showed a definite improvement in efficiency at low advance ratios and in static operation due to use of proplets. Extensive velocity measurements were made using a LDV system. The large amounts of data gathered are presented to reveal clearly the tip vortex streaming back from the propeller. The velocities were also processed using momentum theorem to obtain the thrust and power radial distributions as well as the integrated thrust and power coefficients. The thrust coefficient compared well with force measurements and theoretical prediction from vortex lattice and Goldstein analysis. However, the power coefficient calculated from the momentum analysis was consistently lower than the theoretical or measured values. The measured velocities were also used to compute the vorticity and the trajectory of the tip vortex in the wake behind the propeller. Author

**PROPELLER DESIGN BY OPTIMIZATION**

M. H. RIZK and W.-H. JOU (Flow Industries, Inc., Kent, WA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. refs

(Contract NAS3-24533)

(AIAA PAPER 86-0081)

The feasibility of designing propellers by an optimization procedure is investigated. A scheme, which solves the full potential flow equation about a propeller by line relaxation, is modified so that the iterative solutions of the flow equation and the design parameters are updated simultaneously. Some technical problems in using optimization for designing propellers with maximum efficiency are identified. Approaches for overcoming these problems are presented. Author

**A86-19853#**

**SMALL SCALE WIND TUNNEL TESTING OF MODEL PROPELLERS**

R. M. BASS (Dowty Rotol, Ltd., Gloucester, England) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. refs

(AIAA PAPER 86-0392)

The difficulty and cost of measuring the performance of full scale propellers can be avoided by the use of models operating at correct Mach numbers. Inevitably the Reynolds numbers are low and it is a matter of great difficulty to scale model behavior to full size. In order to obtain a better understanding of scale effects a series of experiments has been conducted in a variable density tunnel in which the separate effects of Reynolds number and Mach number were studied and conclusions drawn as to the limit of validity of model tests. In addition to the obvious effects of Reynolds and Mach number, other effects present are being investigated. To explore the pressure distribution over the blades, a rig has been constructed in which blade surface pressure on a rotating model can be measured. The rig is described and the salient features of data reduction discussed. Some results indicating the potential of the rig are presented. Author

**INFRARED EMISSION FROM JET ENGINE EXHAUST PLUMES**

H. F. NELSON (Missouri-Rolla, University, Rolla) and E. O. TUCKER AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. Research supported by McDonnell Douglas Astronautics Co. refs

(AIAA PAPER 86-0465)

B2O3 particle IR scattering and emission property data concerning scattering cross sections, albedo, and scattering phase functions, which were generated on the basis of radiative reflection and transmission data from the literature, are subjected to a Kramers-Kronig analysis in order to convert radiative data into index-of-refraction values. Scattering parameters required by the Standardized IR Radiation Model (SIRRM) code are obtained from the refractive index values using Mie scattering analysis for 2-25 micron wavelength radiation. SIRRM is used to calculate the broadside IR radiation emitted from isothermal and homogeneous models of turbojet and ramjet exhaust plumes, and it is found that radiant emission increases with increasing particle size and particle mass loading. O.C.

**ANALYSIS OF INTERACTING DUAL LIFTING EJECTOR SYSTEMS**

T. S. LUND, D. A. TAVELLA, and L. ROBERTS (Stanford University, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 11 p. refs

(Contract NCC2-150)

(AIAA PAPER 86-0478)

An analytical treatment is presented for a flowfield generated by a pair of interacting, two-dimensional parallel jets, representative of the two exhaust streams issuing from the thrust augmentor nozzles of dual lifting jet VTOL aircraft propulsion systems. Predictions of the analysis for the ratio of primary to secondary velocity are in close agreement with experimentally observed values, if the spreading rate parameter is allowed to assume a value greater than that which applies to a free jet. Theoretical results are combined with existing experimental data for unventilated jets, in order to arrive at an estimate of the thrust augmentation produced by a jet pair with an arbitrary degree of ventilation. O.C.

**A86-19965#**

**AN ANALYTICAL INVESTIGATION OF THE EFFECTS OF SWIRLER DESIGN ON THE PERFORMANCE OF ANNULAR PROPULSIVE NOZZLES**

J. D. HOFFMAN, H. D. THOMPSON, and D. L. MARCUM (Purdue University, West Lafayette, IN) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. USAF-sponsored research. refs

(AIAA PAPER 86-0587)

An analytical performance prediction methodology for annular propulsive nozzles with swirl introduced in the combustor upstream of the nozzle is presented. The methodology is applied to investigate the effects of swirler design on the performance of annular propulsive nozzles. Four types of swirlers were investigated: free vortex, constant angle, forced vortex, and Rankine vortex swirlers. Discharge coefficients, specific impulses, and wall pressure distributions are presented. These numerical studies show that the discharge coefficient, the thrust, and the vacuum specific impulse decrease as the amount of swirl increases, but that the decrease in specific impulse is modest. The effect of swirl on the discharge coefficient, for all four swirler designs, correlates well with the mass-averaged swirl introduced into the flowfield by the swirler. However, the decrease in vacuum specific impulse is a function of the swirler design. The forced vortex swirler has the least decrease in specific impulse with increasing swirl while the free vortex swirler has the greatest decrease. This methodology will enable nozzle designers to account for the effects of swirl in nozzle design. Author

**A NUMERICAL METHOD FOR THE DESIGN AND ANALYSIS OF COUNTER-ROTATING PROPELLERS**

S. C. PLAYLE, K. D. KORKAN, and E. VON LAVANTE (Texas A & M University, College Station) Journal of Propulsion and Power (ISSN 0748-4658), vol. 2, Jan.-Feb. 1986, p. 57-63. refs

(Contract NAG3-354)

(AIAA PAPER 84-1205)

A numerical method has been developed using the techniques of Lock and Theodorsen as described by Davidson to design and analyze counter-rotating propellers. The design method develops the optimum propeller geometry by calculating the planform and twist distribution for each propeller disk through the use of specific inputs of engine shaft horsepower, diameter, and disk spacing. The analysis method calculates the performance of a given counter-rotating propeller system at any flight condition. Using the NACA four-digit airfoil family, the performance of a counter-rotating propeller design for a given flight condition was investigated in the design and analysis mode. Author

**DISPERSION PROCESS OF JET ENGINE EXHAUST PLUME. II - BUOYANT JET**

A. NISHI (Miyazaki University, Japan) JSME, Bulletin (ISSN 0021-3764), vol. 28, Oct. 1985, p. 2360-2364.

In the previous paper the initial dispersion process of jet engine exhaust plume was discussed with the data of jet engine field test as well as those of the model test. The momentum dominant region in the jet was treated mainly, and the model test was carried out for a few nozzle heights over the ground board corresponded to the engine installing heights of the aircraft. There are considerable differences in the ratio of inertia to buoyant forces in the jet between the engine operating modes, i.e., in takeoff mode (TO) the inertia is dominant, while the buoyancy is dominant in idling mode (ID). These typical conditions of TO and ID modes were examined and the results are compared with each other and with those of field test. The source position of atmospheric turbulent diffusion after the jet dispersion is estimated from these results. Author

**'SMART' ENGINE COMPONENTS - A MICRO IN EVERY BLADE?**

A. H. EPSTEIN (MIT, Cambridge, MA) Aerospace America (ISSN 0740-722X), vol. 24, Jan. 1986, p. 60-62, 64.

'Smart' gas turbine engine technology applies feedback control to the adaptive variation of component settings in changing local conditions; as in any closed loop control system, the smart engine employs sensors, processors, and actuators. Near-term applications of these principles encompass active control of blade tip clearances and active exhaust nozzle position improvement. Longer-term applications extend to active compressor inlet distortion control, active stall alleviation of compressor flow, and active noise control. Hot section smart features may be very long term design concerns, focusing on turbine blade stress or temperature distribution. O.C.

**FUEL PROPERTY EFFECTS UPON EXHAUST SMOKE AND THE WEAK EXTINCTION CHARACTERISTICS OF THE PRATT AND WHITNEY PT6A-65 ENGINE**

P. SAMPATH, M. GRATTON (Pratt and Whitney Canada, Mississauga), D. KRETSCHMER, and J. ODGERS (Universite Laval, Quebec, Canada) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 7 p. Research supported by the Department of National Defence, Department of Regional Industrial Expansion, Pratt and Whitney Canada, and USAF. refs

(ASME PAPER 85-GT-27)

The present paper is concerned with tests involving the use of 10 different fuels in a gas generator. These tests formed part of an investigation of the performance characteristics of small gas turbine combustors, taking into account broadened specification and alternate source fuels. Attention is given to combustor and test equipment, the measurement of exhaust carbon, smoke number relationships, the soot dependence upon air-fuel ratio data, the effect of hydrogen content upon exhaust soot, predictions for the considered engine, carbon formation as a function of engine conditions, and weak extinction characteristics. A correlation parameter which is capable of predicting the effects of different fuels upon the smoke number of several gas turbine engines is presented along with a parameter for predicting weak extinction characteristics. **DESIGN OF COMBUSTOR COOLING SLOTS FOR HIGH FILM EFFECTIVENESS. I - FILM GENERAL DEVELOPMENT**

G. J. STURGESS (United Technologies Corp., Engineering Div., East Hartford, CT) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 7 p. refs

(ASME PAPER 85-GT-35)

It is pointed out that in the main combustion chamber of the gas turbine engine the metal liners forming the combustor have to be provided with some form of thermal protection from the high temperatures of the reacting mixture contained therein. An established technique involves injection of a coolant along the outer surface of the component. This approach is referred to as film cooling. For aircraft gas turbines the protective medium is air, although relatively thin thermal barrier coatings are now a frequent additional feature. The devices for introducing cooling air along the liner surface are called slots. In the present paper heuristic arguments are used to derive a dimensionless grouping of internal geometric parameters which describe the lateral or circumferential uniformity of the films produced by practical slots. Experimental data from a number of different practical slot designs are examined in terms of this geometric mixing parameter. It is shown that the film effectiveness depends on this parameter over a wide range of axial distances and film blowing ratios. G.R.

**DESIGN OF COMBUSTOR COOLING SLOTS FOR HIGH FILM EFFECTIVENESS. II - FILM INITIAL REGION**

G. J. STURGESS and G. D. PFEIFER (United Technologies Corp., Engineering Div., East Hartford, CT) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 9 p. refs

(ASME PAPER 85-GT-36)

A heuristically based geometric grouping has been used to relate the geometry of practical film cooling slots of gas turbine engine combustors to the circumferential uniformity of axial velocity in the film and the average film effectiveness. To be satisfactory, the cooling performance of a slot has been shown to require a low value of this group. A study of film development has been extended to the initial region of the film where cooling performance is at its maximum. It is demonstrated that such a region exists for both practical slots and idealized two-dimensional slots, but that the character of the initial region flow is completely different for practical slots and cannot be described by the same methods as can be used for two-dimensional slots. **THE EFFECT OF FUEL COMPOSITION UPON COMBUSTION PERFORMANCE IN A ROLLS ROYCE TYNE COMBUSTOR**

T. T. BOWDEN and J. H. PEARSON (Shell Research, Ltd., Thornton Research Centre, Chester, England) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 7 p. Research supported by the Ministry of Defence of England. refs

(ASME PAPER 85-GT-39)

The combustion performance of a wide range of fuel types has been examined utilizing a single combustor from a Tyne gas-turbine engine. The results provide further evidence to suggest that fuel total hydrogen content provides a better indication of fuel combustion performance than does aromatic content. However, an even better prediction of fuel combustion performance is given by smoke point, although the acknowledged imprecision of the smoke point test does militate against its use as a primary specification requirement. Analysis of certain fuels by (C-13) nuclear magnetic resonance and low resolution mass spectroscopy demonstrates that it is those fuels with high concentrations of polycyclic aromatic whose combustion performance, in terms of flame radiation and exhaust emissions, is underpredicted by fuel total hydrogen content. There are indications that low concentrations of high molecular weight polycyclic aromatics may substantially impair combustion performance. Author

**COLD FLOW AND COMBUSTION EXPERIMENTS WITH A NEW BURNER AIR DISTRIBUTION CONCEPT**

B. J. JOHNSON (United Technologies Research Center, East Hartford, CT), S. J. MARKOWSKI, and H. M. CRAIG (United Technologies Corp., Pratt and Whitney Div., East Hartford, CT) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX. Mar. 18-21, 1985. 6 p. refs
(ASME PAPER 85-GT-40)

Experiments were conducted with a JT8D-engine sized can combustor modified such that all the combustion and dilution air entered through the burner front face from a single plenum through counter-rotating annular swirlers. Cold flow experiments were conducted to visualize and to develop a mixing and recirculation flow pattern within the combustor which contained annular and central recirculation cells and featured rapid mixing in the downstream section of the combustor. Laser velocimeter measurements, downstream of the air inlet configuration used in the combustion experiments, showed the largest velocity gradients in the tangential velocity profile. Low-pressure combustion experiments were conducted with three flat spray fuel nozzle orientations and three air inlet geometries to determine the general air inlet and fuel injection characteristics required to produce acceptable combustion characteristics with the selected swirler configuration. The combustion experiments included emission, total pressure and total temperature measurements at the burner exit plane. Low emission levels and temperature pattern factors with relatively low burner pressure losses were demonstrated. Author

**DYNAMIC ANALYSIS OF COMPLEX COMPOSITE ROTOR SYSTEMS WITH SUBSTRUCTURE TRANSFER MATRIX METHOD**

L. YAN (Beijing Institute of Aeronautics and Astronautics, People's Republic of China) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 9 p.
(ASME PAPER 85-GT-74)

A substructure transfer matrix method for the dynamic analysis of multi-rotor systems and complex composite systems is presented. When calculating, the rotor system should be decomposed into several single rotor shafts (substructures). Corresponding unknown external loads and deflections are applied to the separated surfaces, rigid support sections and ball joint sections respectively to replace the original connections. According to the connective and boundary conditions of the whole rotor system, a system of equations is established, from which the frequency equation results. The calculating formulas of vibration modes and of unbalanced responses will be easily formed by linear combination method. All computations are performed with the transfer matrix method. This method is intelligible, readily programmed and much simpler than the current transfer matrix method and modal synthesis method. Author

**POWER DENSE GAS TURBINE APUS**

C. RODGERS (Solar Turbines Inc., Turbomach Div., San Diego, CA) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 11 p. refs
(ASME PAPER 85-GT-124)

Meeting the design requirements of smaller size, lower weight, and fast stars over wider operator envelopes for next-generation auxiliary power units (APUs) may conflict with equally compelling requirements for high thermal efficiency, since optimum cycle conditions differ for maximum specific power and lowest specific fuel consumption. Attention is presently given to the design disciplines constraining power density values for small gas turbine-type APUs; centrifugal compressors with integral radial-inflow turbines are highlighted in research efforts. **AN IMPROVED SIMPLE METHOD FOR DESIGNING OPTIMUM ANNULAR DIFFUSERS**

R. CAI, H. JIANG, and Y. ZHU (Chinese Academy of Sciences, Institute of Engineering Thermophysics, Beijing, People's Republic of China) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 8 p. Research supported by the Chinese Academy of Sciences. refs
(ASME PAPER 85-GT-126)

A set of simple BASIC codes for calculating the design parameters for axial, radial, and mixed-type annular diffusers is described. The codes are a numerical version of the Mean Stream Line method developed by Wu et al. (1952) for analyzing the two-dimensional flow field in annular diffusers. The main input data for the codes are inlet geometry, the flow parameters of the diffuser, the specific heat ratio of the working fluid, and the Laval number. The codes can be run on a pocket computer within a few minutes. Some sample calculations for an axial diffuser between a gas generator and a power turbine are presented. I.H.

**EVALUATION OF FUEL PREPARATION SYSTEMS FOR LEAN PREMIXING-PREVAPORIZING COMBUSTORS**

W. J. DODDS and E. E. EKSTEDT (General Electric Co., Aircraft Engine Business Group, Cincinnati, OH) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 5 p. refs
(Contract NAS3-22006)
(ASME PAPER 85-GT-137)

A series of experiments was carried out in order to produce design data for a premixing prevaporizing fuel-air mixture preparation system for aircraft gas turbine engine combustors. The fuel-air mixture uniformity of four different system design concepts was evaluated over a range of conditions representing the cruise operation of a modern commercial turbofan engine. Operating conditions including pressure, temperature, fuel-to-air ratio, and velocity, exhibited no clear effect on mixture uniformity of systems using pressure-atomizing fuel nozzles and large-scale mixing devices. However, the performance of systems using atomizing fuel nozzles and large-scale mixing devices was found to be sensitive to operating conditions. Variations in system design variables were also evaluated and correlated. Mixing uniformity was found to improve with system length, pressure drop, and the number of fuel injection points per unit area. A premixing system capable of providing mixing uniformity to within 15 percent over a typical range of cruise operating conditions is demonstrated. I.H.

**RE-ENGINING THE HARRIER**

J. D. CYRUS (U.S. Navy, Naval Air Development Center, Warminster, PA) and W. M. VOWLES (Rolls Royce, Ltd., Bristol, England) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 8 p.
(ASME PAPER 85-GT-175)

During the last twenty-eight years the capabilities of the Harrier have improved markedly, due in large measure to advances in the Pegasus propulsion system. New engine models and component improvements with their increased performance and/or weight reductions have produced increased range and payload capability for the aircraft. Because the Harrier is likely to continue in use well into the next century, an engine-aircraft-mission study has been conducted to identify the potential benefits arising from replacing the existing Pegasus engine with an advanced technology engine. These studies have shown that thrust increases associated with increased technology can improve mission capability substantially; radius can be increased by as much as 50 percent on a mission with a vertical takeoff requirement. However, as takeoff constraints are relaxed, aircraft restraints limit the benefits of the advanced technology engines. Author

**T56 DERIVATIVE ENGINE IN THE IMPROVED E-2C**
T. P. LAUGHLIN (General Motors Corp., Allison Gas Turbine Div., Indianapolis, IN) and J. TOTH (Grumman Aerospace Corp., Bethpage, NY) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 9 p.
(ASME PAPER 85-GT-176)

Airborne Early Warming for the Navy fleets has been provided for the past 20 years by the E-2 Airframe/T56 engine combination. Although avionic capability has been continually updated to meet the increased threat, the airframe and powerplant have seen only minor changes. Projected mission requirements and future avionic system enhancements require payload increases being limited by the power capability of the present T56 powerplant. Of paramount importance in the E-2 carrier deck operation is the single engine rate of climb capability of the aircraft. This paper discusses the logical evolution of a replacement engine for the E-2C, a derivative T56 engine contracted and designated by the Navy as the T56-A-427, to meet the projected single engine takeoff and other mission requirements. The T56-A-427 provides 24 percent power and 13 percent fuel consumption improvements with identical installation interfaces, and substantially improves E-2C performance characteristics across the flight envelope. Furthermore, the paper shows that meeting these stringent performance requirements with a derivative engine results in a low risk development program and an engine with improved maintainability and reliability, which can capitalize on the in-place logistics support base of the T56.

**3-D DESIGN OF TURBINE AIRFOILS**
J. HOURMOUZIADIS and N. HUEBNER (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 7 p. refs
(ASME PAPER 85-GT-188)

With modern turbines operating at a high level of efficiency, sophisticated design techniques are needed for further improvements. With the aid of computers three-dimensional aspect like end wall contouring and airfoil stacking can be integrated into the design process. The possibilities presented by the latter to control reaction, loading and secondary flow effects are analyzed and compared with experimental results. The implications for the resulting airfoil geometry are shown and limitations are discussed.

**AXIAL FLOW CONTRA-ROTATING TURBINES**
J. F. LOUIS (MIT, Cambridge, MA) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985 . 9 p. refs
(ASME PAPER 85-GT-218)

Two types of contra-rotating stages are considered; the first uses guide vanes and the second is vaneless. The wheels of the first type use bladings which are mirror images of each other and they operate with inlet and outlet swirl. The second type uses dissimilar bladings in each of the two wheels with axial inlet velocity to the first wheel and axial outlet velocity for the second wheel. An analysis of their performance indicates that both types can reach stage loading coefficients comparable or larger than conventional turbines with the same number of wheels. A comparison of the contra-rotating stages with conventional ones indicate a significant stage efficiency advantage of the contra-rotating over the conventional single rotation stages due mainly to the elimination of stationary vanes. The off-design performance indicates that relative wheel speed must be controlled. The attributes of contra-rotating turbines suggest their potential use in high performance aircraft engines, in dynamic space power systems and in low speed industrial gas turbines. Author

**DEVELOPING CONCEPTS IN THE ROTORDYNAMIC ANALYSIS OF AERO GAS TURBINES**
R. A. BELLAMY, C. P. JONSON, and R. GAFFNEY (Rolls-Royce, Ltd., Derby, England) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 10 p. refs
(ASME PAPER 85-GT-230)

Three-dimensional nonaxisymmetric finite element models of complete aircraft gas turbine engines are routinely used as a design tool by manufacturers, in order to evaluate the static and dynamic structural characteristics of novel designs. These design models yield an order of magnitude more information than earlier ones, but do not allow easy use of the former evaluation criteria because of this expanded information's greater complexity. Animation of the graphics representing model structural response has become an essential part of analyses, in order to clarify the information generated.

**EVOLUTION OF THE TURBOFAN AIRCRAFT ENGINE**
M. E. SHANK (United Technologies Corp., Engineering Div., West Palm Beach, FL) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Insitute of Aeronautics and Astronautics, 1985, p. 11-1 to 11-10.

The evolution of the aircraft turbofan engine is broadly outlined, starting with the earliest low bypass ratio engine most widely used in both military transport and commercial applications. The development of this engine is shown to have been critically dependent on parallel development of titanium alloys and processing. Continuing development of low bypass ratio turbofan engines for both military fighter and commercial applications is then described, along with the development of high bypass ratio engines for transport/commerical applications. Important materials, processing, and structural/design problems are described as they relate to particular engines. The paper concludes with brief look at the future of the turbofan engine. Author

**LIQUID FUELED SUPERSONIC COMBUSTION RAMJETS - A RESEARCH PERSPECTIVE OF THE PAST, PRESENT AND FUTURE**
P. J. WALTRUP (Johns Hopkins University, Laurel, MD) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 19 p. refs
(Contract N00024-85-C-5301)
(AIAA PAPER 86-0158)

A development history is presented for research efforts in the field of liquid-fueled supersonic combustion ramjets ('scramjets'), with a view to future development trends. Major areas of intensive concern have been the design features of inlets, isolator air ducts, fuel feed/injection systems, supersonic combustor configurations, and exit nozzles. In addition to ambient temperature and cryogenic fuels, slurry fuels have been considered. It is noted that current understanding of the mechanisms governing mixing and combustion processes in supersonic streams that merge to form a free shear layer is very limited.

(AD-A159312; R84AEB460; AFWAL-TR-84-2109) Avail: NTIS HC A06/MF A01 CSCL 20D

The objective of this program was to develop and codify a method for predicting the spanwise redistribution of energy and loss associated with rotor/stator wakes in an axial-flow compressor. The mechanisms considered were: (1) spanwise transport of wake fluid due to imbalance of the radial pressure gradient; and (2) accumulation/dilution of wake fluid at the inner and outer casing. The work consisted of developing computer modules that perform the above defined objectives. This report describes mathematical formulas derived for definition of the peak radial and streamwise velocity decrements/increments in a wake at a blade trailing edge and their decay with downstream distance. Comparisons with data show good agreement in most cases. In addition, the thickness, displacement thickness, and momentum thickness of the wake were calculated and used in the prediction of changes in the circumferential average flow solution caused by the migration of wake fluid across streamlines. A. G. DODD 27 Feb. 1985 47 p refs
(PNR-90247) Avail: NTIS HC A03/MF A01

The methods used for the mechanical design of hot gas turbine blading are discussed. A rapid mechanical assessment, done before the design proceeds further, is examined. The method gives an outline of the design specifying material choice, rim load on disks, cross sectional areas and mean level of cooling technology. Failure modes are discussed. It is suggested that they can be overcome by choosing a temperature and stress for each radial position. Blades are optimized by varying the required cooling technology or by changing the cross-sectional areas. Author (ESA)

**USE OF DIFFERENTIAL LEADING EDGE FLAPS FOR LATERAL CONTROL AT HIGH ANGLE OF ATTACK**

D. T. WARD and L. J. STOUT (Texas A & M University, College Station) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. Research sponsored by the General Dynamics Corp. and Texas A & M University. refs

(AIAA PAPER 86-0168)

The use of differential leading-edge flaps (DLEF's) in providing roll control at high angles of attack on a high-performance fighter configuration was investigated by conducting a series of wind tunnel (WT) tests and six-degree-of-freedom simulations. The WT tests, performed on a GD/FW WT model planform, were primarily concerned with determining the roll control effectiveness with outboard ailerons, DLEFs, and trailing-edge flaps (flaperons) compared at angles of attack of 30 to 40 deg. A realistic flight control system model (EASY 4) was combined with the TW test database to generate a computer simulation (CS). The CS was validated by comparison with flight test data for a similar aircraft. The CS time histories showed that, even at a low dynamic pressure of 25 psf, a roll rate of up to 50 deg/s can be developed between 30 and 40 deg angles of attack. At a dynamic pressure of 200 psf, estimated roll rates of about 90 deg/s were generated. I.S.

**EXPERIMENTAL STUDY OF EFFECTS OF FOREBODY GEOMETRY ON HIGH ANGLE OF ATTACK STATIC AND DYNAMIC STABILITY**

J. M. BRANDON and L. T. NGUYEN (NASA, Langley Research Center, Hampton, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. refs

(AIAA PAPER 86-0331)

A series of low speed wind tunnel tests on a generic fighter model with a cylindrical fuselage were made to investigate the effects of forebody shape on static and dynamic lateral/directional stability. Five forebodies, including a chine nose of unconventional cross-sectional shape, were tested. Conventional force tests were conducted to determine static stability characteristics and single degree-of-freedom free-to-roll tests were used to study the wing rock susceptibility of the model with the various forebodies. Flow visualization data were obtained to aid in analysis of the complex flow phenomena involved. The results show that forebody cross-sectional shape can strongly effect both static and dynamic (roll) stability at high angles of attack. Large variations in stability were obtained for the various forebody geometries. These characteristics result from the impact of cross-sectional shape on forebody vortex development, the behavior of the vortices at sideslip conditions, and their interaction with the wing and empennage flow fields. Author

**EXPLORATORY INVESTIGATION OF DEFLECTABLE FOREBODY STRAKES FOR HIGH ANGLE OF ATTACK YAW CONTROL**

D. M. RAO (Vigyan Research Associates, Inc., Hampton, VA) and D. G. MURRI (NASA, Langley Research Center, Hampton, VA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p.

(AIAA PAPER 86-0333)

A deflectable strake concept was investigated on a conical forebody to evaluate its yaw control potential at high angles of attack. In exploratory low-speed tunnel tests using a generic delta wing fighter configuration, antisymmetrically deflected strakes provided useful levels of yaw power at angles of attack when the conventional rudder became totally degraded. Symmetrical strakes prevented side force development at high angles of attack, and provided pitch control through symmetrical deflection. The strake performance was sensitive to its circumferential position on the forebody due to varying interaction of strake vortices with the wing and vertical tail. The low Reynolds number results of this study provided a favorable initial validation of the concept, subject to verification in regard to scale effects. Author

**A FLIGHTPATH OVERSHOOT FLYING QUALITIES METRIC FOR THE LANDINIG TASK**

D. T. BERRY (NASA, Flight Research Center, Edwards, CA) AIAA, Aerosapce Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p.

(AIAA PAPER 86-0334)

An analysis was conducted of the attitude and flightpath angle response of configurations used in the Total In-Flight Simulator (TIFS) pitch-rate command systems program. The resutls show poor correlation between pilot ratings and attitude response and indicate that attitude was not a major influence in the results. A strong correlation was found to exist, however, between the amount of fightpath angle peak overshoot and the pilot ratings. This correlation is similar to the best correlations that have been obtained in recent closed-loop and time-domain analyses but has the advantage of greatly simplified implementation and interpretation. **USE OF SIMULATION DURING PRELIMINARY DESIGN OF THE V-22 OSPREY**

N. N. BATRA, L. W. DOOLEY (Bell Helicopter Textron, Inc., Fort Worth, TX), T. A. SHEEHAN, and K. W. GOLDSTEIN (Boeing Vertol Co., Philadelphia, PA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 8 p. refs

(AIAA PAPER 86-0491)

This paper describes the use of piloted simulation during preliminary design of the first operational tilt rotor aircraft. The develeopment and validation of a generic tilt rotor simulation program and its application towards development of the control laws, selection of the pilot's control system, and early evaluation of the handling qualities are discussed. Specific simulation tasks designed to exercise the tilt rotor's characteristics under operating conditions are described. The average handling qualities ratings for the simulated tasks from seven pilots show that the basic aircraft, without the AFCS, will meet Level 2 criteria and, when augmented by the AFCS, will meet Level 1 criteria. **INVESTIGATION OF AIRCRAFT DEPARTURE SUSCEPTIBILITY USING A TOTAL-G SIMULATOR**

G. R. RHODESIDE (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 12 p. refs

(AIAA PAPER 86-0492)

An assembly of generic aircraft configurations have been tested for their departure and spin susceptibility and their high angle of attack flying qualities using the Naval Air Development Center's (NADC) Dynamic Flight Simulator (DFS). The DFS produces the total-G environment needed to replicate actual flight. It does this because it harnesses the vector and angular accelerations provided by NADC's three-degree-of-freedom centrifuge. An elegant control algorithm takes pilot inputs and orients and acceleratos the DFS cockpit in such a manner as to yield a high level of flight fidelity. Static lateral-directional stability derivatives and inertias were varied in the experiment so as to examine the departure criteria under question (Cn-beta DYNAMIC and Lateral Control Departure Parameter, LCDP) thus providing information which will be used to develop a design guide or specification. Analysis shows the departure regions defined by Cn-beta DYN and LCDP are a good indication of departure flying qualities in the high angle of attack realm. An updated, more objective departure rating scale has been devised based on considerations of this experiment. Author

**AN ENGINEERING SIMULATION OF THE BOEING 747 PRIMARY FLIGHT CONTROL SYSTEMS**

H. H. STRAUB (Boeing Commercial Airplane Co., Seattle, WA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 7 p.

(AIAA PAPER 86-0494)

A high-fidelity force-input simulation of the primary flight control systems of a 747 commercial aircraft is described. The performance characteristics of the major hardware components (pilot and copilot control, cable systems hydraulic actuator, and linkages) were modeled in detail, and minor modifications were incorporated to achieve a satisfactory match to aircraft ground test data. The simulation can be run in real time on an analog computer without integration problems and can be used as an engineering tool for the evaluation of hardware modifications to both the manual and autopilot control paths. The simulated flight control data are given together with ground test results in dynamic and static test conditions. A block diagram describing the simulation approach is provided. I.H.

**A REDUNDANT STRAPDOWN REFERENCE FOR ADVANCED AIRCRAFT FLIGHT CONTROL SYSTEMS**

L. CAMBERLEIN and P. NICAISE (Societe d'Applications Generales d'Electricite et de Mecanique, Paris, France) IN: Symposium Gyro Technology 1984; Proceedings of the Symposium, Stuttgart, West Germany, September 11, 12, 1984 . Stuttgart/Duesseldorf, Universitaet Stuttgart/Deutsche Gesellschaft fuer Ortung und Navigation, 1984, p. 15.0-15.27.

This paper shows the advantage of the skewed axis redundancy and of two-axis dry tuned gyros for providing electric flight control systems with a strapdown reference. It describes the theoretical features of the skewed axis redundancy and provides the results of laboratory tests performed on the development system MSDO3. As a conclusion, the article describes a reference, for fighter aircraft flight control systems, that provides, in addition, backup attitude and navigation. Author

**TALKING TO YOUR AIRCRAFT**

E. J. LERNER Aerospace America (ISSN 0740-722X), vol. 24, Jan. 1986, p. 84-86, 88.

The most promising development trends and performance capability prospects for cockpit control voice recognition systems are considered, with attention to the solution of the problems of contextuality that inhere in the semantics of spoken languages. The recognition of speech in the high stress and frequently noisy environment of military aircraft cockpits presents especially troublesome design problems. Emphasis is on the recognition of commands for the execution of a given task that may be couched in very different sentences by the same pilot at different times. O.C.

**GUST ALLEVIATION USING COMBINED CONTROL LAWS**

J. CHANG (Northwestern Polytechnical University, Xian, People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Aug. 1985, p. 379-384. In Chinese, with abstract in English.

An analytical method of gust alleviation and other active control purposes (relaxed static stability, etc.) for an airplane is described. Gust alleviation uses direct measurements of atmospheric turbulence to yield a feed-forward or open-loop control law. It is relatively insensitive to changes in flight conditions. Thus a combined control law can be obtained which contains feed-back and feed-forward components. The stability of the gust alleviation system and the performances of other active control purpose can be satisfied by obtaining a linear optimal control defined by a quadratic performance index. Thus the performance index is combined, and the optimal feed-back control law is straightforward and well-known. An application of the combined control law to a flexible airplane is presented. Calculations have been performed to obtain the normal acceleration responses of the airplane to the turbulence and the state responses for the other active control purpose. Author

**AN INVESTIGATION OF ADAPTIVE CONTROLLERS FOR HELICOPTER VIBRATION AND THE DEVELOPMENT OF A NEW DUAL CONTROLLER Final Report**

P. MOOKERJEE, J. A. MOLUSIS, and Y. BAR-SHALOM Jan. 1985 162 p refs

(Contract NAG2-213)

(NASA-CR-177377; NAS 1.26:177377) Avail: NTIS HC A08/MF A01 CSCL 01C

An investigation of the properties important for the design of stochastic adaptive controllers for the higher harmonic control of helicopter vibration is presented. Three different model types are considered for the transfer relationship between the helicopter higher harmonic control input and the vibration output: (1) nonlinear; (2) linear with slow time varying coefficients; and (3) linear with constant coefficients. The stochastic controller formulations and solutions are presented for a dual, cautious, and deterministic controller for both linear and nonlinear transfer models. Extensive simulations are performed with the various models and controllers. It is shown that the cautious adaptive controller can sometimes result in unacceptable vibration control. A new second order dual controller is developed which is shown to modify the cautious adaptive controller by adding numerator and denominator correction terms to the cautious control algorithm. The new dual controller is simulated on a simple single-control vibration example and is found to achieve excellent vibration reduction and significantly improves upon the cautious controller. The principle of piloted vehicle mechanics is presented, and aircraft longitudinal movement is studied. Assuming that the pilot counters with his lateral controls any sideslip, and that the aircraft plane of symmetry is vertical, the trajectory is described in that same vertical plane. The natural modes (angle of attack oscillation, phugoid, aperiodic motion) of the small movements around straight and level flight, the response to the pilots commands, and equilibrium stability, are examined. Small lateral movements around straight and level flight and the aircraft response to lateral controls are considered. Small movements of the aircraft around stabilized level flight in rotation are also examined. The assumptions of separation of longitudinal and lateral movements around stabilized straight and level flight are validated. Author (ESA)

**ESTIMATION OF SIDEFORCE, YAWING MOMENT AND ROLLING MOMENT DERIVATIVES DUE TO RATE OF YAW FOR COMPLETE AIRCRAFT AT SUBSONIC SPEEDS**
Apr. 1984 52 p refs Submitted for publication
(ESDU-84002; ISBN-0-85679-463-5; ISSN-0141-397X) Avail: ESDU

ESDU 84002 demonstrates how methods given elsewhere in the Sub-series for estimating the contributions to the derivatives Y sub r, N sub r and L sub r due to individual major parts of the airframe (wing, bodies, flaps and fin) may be combined to provide values for the complete aircraft. The overall accuracy achieved is illustrated by correlation plots showing comparison of prediction with flight test and wind tunnel results drawn from many sources in the literature; for a diverse range of configurations broadly Y sub r is predicted within 0.05, N sub r within 0.025 and L sub r within 0.02. A simplified method for estimating complete aircraft yawing derivative values is also included. Author

This report presents the development and application of a sensitivity analysis technique for multiloop flight control systems. This analysis yields very useful information on the sensitivity of the relative-stability criteria of the control system, with variations or uncertainties in the system and controller elements. The sensitivity analysis technique developed is based on the computation of the singular values and singular-value gradients of a feedback-control system. The method is applicable to single-input/single-output as well as multiloop continuous-control systems. Application to sampled-data systems is also explored. The sensitivity analysis technique was applied to a continuous yaw/roll damper stability augmentation system of a typical business jet, and the results show that the analysis is very useful in determining the system elements which have the largest effect on the relative stability of the closed-loop system. As a secondary product of the research reported here, the relative stability criteria based on the concept of singular values were explored. B.W.

**THE NEW 'DUAL STAGE' TEST PROCEDURE FOR LOW COST MEASUREMENT OF PARACHUTE PERFORMANCE**
R. W. HUNTER (U.S. Navy, Naval Weapons Center, China Lake, CA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 157-160.

The Parachute Service Life Extension Program represents a joint Navy and Air Force program which was initiated in 1983 with the aim to establish scientifically-based service and storage lives for personnel parachutes. The criteria selected for establishing the optimum service and storage lives are related to age-caused changes in parachute reliability and material properties. In order to determine the number of tests (per parachute type) required to statistically measure the effects of aging on reliability, a test plan was prepared. In accordance with this plan, 280 reliability tests were initially scheduled for Fiscal Year 1984. The two standard test procedures considered for the reliability tests are discussed, taking into account certain problems. As a solution to these problems, a dual stage test procedure was developed. This procedure consists of two parts, including a descent rate measurement test and a parachute stress test. G.R.

**BALLISTIC GAS FIRED DEVICES**
P. MILCETIC (U.S. Navy, Naval Ordnance Station, Indian Head, MD) and M. SCHIMMEL (McDonnell Aircraft Co., St. Louis, MO) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 179-182. refs

The Naval Ordnance Station has conducted a program researching the feasibility of using hot gases from a standard initiator to ignite an explosive train, with an output which initiates percussion primers. This technique eliminates parts required in standard firing mechanisms, including the firing pin, O-ring seal, and shear pin. This allows redundant primers to be incorporated into an existing single primer firing mechanism without changing the exterior envelope. One hundred and six 'breadboard' tests were conducted over the temperature range of -65 F to +165 F, using various ballistic hose configurations, including simulation of specific aircraft escape systems. The feasibility and reliability of this technique is examined by analyzing the test results. Application of this design to other escape system devices is also discussed in this paper. . Author

**DEVELOPMENT OF A GENERALIZED ESCAPE SYSTEM SIMULATION COMPUTER PROGRAM**
L. A. DAULERIO (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) and D. A. FENDER (Ketron, Inc., Warminster, PA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 246-250. refs

It is pointed out that the development of escape systems for safely ejecting crewmembers from high performance military aircraft is a complex and demanding task. For this reason, the U.S. Navy has based research for the improvement of escape systems partly on the mathematical simulation of the operation of such systems. The present paper is concerned with the development of a simulation model which has now become known as the Generalized Escape System. Simulation (GESS) program. The GESS program divides the ejection sequence into three primary phases. The model is based upon the numerical integration of the six degree-of-freedom equations of motion for each of four basic program elements. Development issues are discussed, taking into account coordinate systems and transformations, aerodynamic coefficients, computational considerations, the dynamic center of gravity, the user interface, and aspects of verification. G.R.

**REFLECTIONS REGARDING RECENT ROTARY RIG RESULTS**

L. E. ERICSSON (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 8 p. refs

(AIAA PAPER 86-0123)

Recent rotary rig experiments are examined to evaluate how well they simulate dynamic conditions existing in full scale flight. It is found that most rig designs used are prone to cause significant interference with the vortex wake shed from an advanced aircraft at high angles of attack. The support interference problem can be aggravated substantially by the coupling existing in the critical Reynolds number range between vehicle motion and boundary layer transition, a coupling that is unlikely to have been simulated in most wind tunnel tests. **FACILITY FOR CLOSED LOOP TESTING OF AIRCRAFT CONTROL SYSTEMS**

J. BLAETZ (McDonnell Aircraft Co., St. Louis, MO) IN: Environmental integration technology today for a quality tomorrow; Proceedings of the Thirtieth Annual Technical Meeting, Orlando, FL, May 1-3, 1984 . Mount Prospect, IL, Institute of Environmental Sciences, 1984, p. 319-321.

Improvements in aircraft performance have brought the need for more precise testing of flight control systems prior to flight. McDonnell Aircraft Company has developed a flight control system functional mockup for the AV-8B Harrier II to perform tests on the completely integrated aircraft flight control system. A high-speed digital computer incorporated into the functional mockup permits testing of the flight control system in real time. The computer, employing parallel processors, solves the non-linear equations of motion that describe the aircraft's six degrees of freedom. This paper describes the computer system, its programming, and the interfacing of the computer with the functional mockup. The paper also discusses the functional mockup design, instrumentation, and data collection and analysis. Typical test operations on the flight control systems are also described. Author

**PERFORMANCE OF AV-8B HARRIER II STRUCTURAL TEST PROGRAM**

J. V. MURPHY, D. E. SCHNORING, and H. C. TOURKAKIS (McDonnell Aircraft Co., St. Louis, MO) IN: Environmental integration technology today for a quality tomorrow; Proceedings of the Thirtieth Annual Technical Meeting, Orlando, FL, May 1-3, 1984 . Mount Prospect, IL, Institute of Environmental Sciences, 1984, p. 322-327.

As part of the AV-8B Harrier II Full-Scale Development Program, a structural test program, including both static and fatigue tests, was conducted from 1981 through 1983. The program was satisfactorily completed, within cost and on schedule, which attests to the high efficiency of the structure. The static tests related to the flight placards were completed ahead of schedule, as desired, and the two-lifetime fatigue test was also completed early. This paper describes how the combined efforts of NAVAIR and MCAIR led to the accomplishment of the program objectives. It also illustrates that the success of the program was a function of advance planning, effective communications, in-depth status monitoring, and maintaining basic program objectives. Author

**SIMULATION AND ANALYSIS OF NATURAL RAIN IN A WIND TUNNEL VIA DIGITAL IMAGE PROCESSING TECHNIQUES**

K. M. AARON, M. HERNAN, P. PARIKH, V. SAROHIA (California Institute of Technology, Jet Propulsion Laboratory, Pasadena), and M. GHARIB (California, University, La Jolla) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 6 p. refs

(Contract NAS7-918; NASA ORDER RE-65-459; NASA TASK 505-45-00-04-59)

(AIAA PAPER 86-0291)

It is desired to simulate natural rain in a wind tunnel in order to investigate its influence on the aerodynamic characteristics of aircraft. Rain simulation nozzles have been developed and tested at JPL. Pulsed laser sheet illumination is used to photograph the droplets in the moving airstream. Digital image processing techniques are applied to these photographs for calculation of rain statistics to evaluate the performance of the nozzles. It is found that fixed hypodermic type nozzles inject too much water to simulate natural rain conditions. A modification uses two aerodynamic spinners to flex a tube in a pseudo-random fashion to distribute the water over a larger area. Author

**SIMULATION OF A SIX DEGREES OF FREEDOM FLIGHT SIMULATOR MOTION SYSTEM**

G. J. WIERDA 1 May 1982 47 p refs

(UA-00-39) Avail: Issuing Activity

A model of a single hydraulic actuator and controller developed to investigate nonlinearities in the servo valve transfer function to limit the amount of hardware in the simulation, was simplified by linearizing the square roots in the pressure-flow relationship. Six of the simplified models were coupled to obtain a simulation model of a complete six degrees of freedom motion system. A transformation and mass matrix to describe the dynamic equations were calculated for a motion system. Simulation results indicate high underdamped frequency components in the acceleration response of the actuators. It is shown that acceleration feedback rather than force feedback is preferred to damp the high frequency components. Author (ESA)

**STUDY OF ICE ACCRETION ON ICING WIND TUNNEL COMPONENTS**

J. E. NEWTON and W. OLSEN 1986 24 p refs Presented at the 24th Aerospace Sciences Meeting, Reno, Nev., 6-8 Jan. 1986; sponsored by AIAA

(NASA-TM-87095; E-3828; NAS 1.15:87095) Avail: NTIS HC A02/MF A01 CSCL 01E

In a closed loop icing wind tunnel the icing cloud is simulated by introducing tiny water droplets through an array of nozzles upstream of the test section. This cloud will form ice on all tunnel components (e.g., turning vanes, inlet guide vanes, fan blades, and the heat exchanger) as the cloud flows around the tunnel. These components must have the capacity to handle their icing loads without causing significant tunnel performance degradation during the course of an evening's run. To aid in the design of these components for the proposed Altitude Wind Tunnel (AWT) at NASA Lewis Research Center the existing Icing Research Tunnel (IRT) is used to measure icing characteristics of the IRT's components. The results from the IRT are scaled to the AWT to account for the AWT's larger components and higher velocities. The results show that from 90 to 45 percent of the total spray cloud froze out on the heat exchanger. Furthermore, the first set of turning vanes downstream of the test section, the FOD screen and the fan blades show significant ice formation. The scaling shows that the same results would occur in the AWT. Author

C. C. CIEPLUCH, R. R. BURLEY, D. E. GROESBECK, and J. C. MAREK 1986 19 p refs Proposed for presentation at the 14th Aerodynamic Testing Conference, West Palm Beach, Fla., 5-7 Mar. 1986; sponsored by AIAA

(NASA-TM-87194; E-2850; NAS 1.15:87194) Avail: NTIS HC A02/MF A01 CSCL 14B

The rehabilitation of the Altitude Wind Tunnel (AWT) at the NASA Lewis Research Center is under study with the goal of providing a modern subsonic wind tunnel for conducting propulsion system/airframe integration, isolated propulsion system, propulsion acoustics and adverse weather tests. Because of the increased Mach number capability (from Mach 0.6 to 0.9 plus) and the incorporation of acoustic and adverse weather capabilities into an existing tunnel, the AWT rehabilitation represents a significant technical challenge. In order to reduce the risk associated with such an undertaking, and extensive AWT modeling program is being conducted to guide and verify the tunnel design. Significant findings and progress in this modeling program are the subject of this paper. Author

(DNW-TR-82-03; D6-51501) Avail: NTIS HC A06/MF A01

The aerodynamic and acoustic quality of the German-Dutch Wind Tunnel open jet test section configuration was established. The flow quality is found to be excellent; for the core region angular deviations up to 0.1 deg, turbulence levels of 0.2% and dynamic pressure deviations of 0.5% are reported. Near the shear layer these values become higher. The anechoic quality meets reasonably high standards. The acoustic correction procedures for 1/3 octave analysis were checked. The usual shear layer correction has to be extended to correct for turbulence effects for high tunnel velocity, high frequency, and the most forward and the most rearward propagation angles from the sound source. This correction is independent of the position of the model in the flow and the type of sound source (tone or broadband). Author (ESA)

(DNW-TR-82-04; D6-51502) Avail: NTIS HC A07/MF A01

Acoustic tests of a 6-cm model jet were conducted in the German-Dutch Wind Tunnel 6m by 8m free jet facility to evaluate a free jet shear layer correction procedure that adds an empirical correction to the previous theoretical correction. Static-flight effects on jet noise measured in the flow were used to evaluate the corresponding out-of-flow results. The experiment demonstrates that the procedure significantly improves the accuracy of the flight effects measured by the out-of-flow microphones. Comparisons of the out-of-flow free jet results to results obtained in closed wind tunnels and from aircraft flyovers show consistent trends. Author (ESA)

Past studies of reentry vehicles tested to high angles of attack (up to 90 deg) in the Mach number range from 2 to 4.8 are reviewed. Two basic planforms are considered: highly-swept deltas and circular. The delta concepts include variations in cross section (and thus volume) and in camber distribution. The effectiveness of various types of aerodynamic control devices is also included. The purpose of the paper is to examine the characteristics of the vehicles with a view toward the potential usefulness of such concepts in a flight regime that would include reentry from space into the atmosphere followed by a transition to sustained atmospheric flight. **A SCIENTIFIC METHOD FOR DETERMINING THE USEFUL LIFE OF EXPLOSIVE DEVICES IN AIRCRAFT**

W. E. EARLY, JR. (General Dynamics Corp., Fort Worth, TX) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 81-88.

Attention is given to an effort by the F-16 System Program Office to determine the useful service life of all explosive devices encompassed by an aircraft crew escape system. This entailed both the experimental determination of the true thermal environment of these explosive devices under worst case operational conditions, and the performance of accelerated service life tests for groups of each type of device to ascertain the safe life of each under the measured conditions. O.C.

**THE USE OF TLX ENERGY TRANSFER LINES ON THE F-16 AIRCRAFT**

W. E. EARLY, JR. (General Dynamics Corp., Fort Worth, TX) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 89-94.

This paper describes TLX (Thin Layer Explosive) in the form in which it has been developed for use on the F-16 aircaft and traces its evolution from the original Swedish product. It illustrates the current applications of TLX in the F-16 and gives the reasons why it has superseded two other types of linear-explosive lines. It summarizes the design requirements established by General Dynamics and the recently completed qualification test program. It discusses some of the advantages of this new product over older types of linear-explosive products (SMDC, FCDC, etc.). In addition, it briefly describes significant informal tests performed to evaluate the safety and ruggedness of TLX. Author

**APPROACH FOR SERVICE LIFE EXTENSION OF EXPLOSIVE DEVICES FOR AIRCRAFT ESCAPE SYSTEMS**

L. J. BEMENT (NASA, Langley Research Center, Hampton, VA) and M. L. SCHIMMEL (McDonnell Aircraft Co., St. Louis, MO) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 334-341.

Service life extension of explosive devices used in aircraft escape systems can achieve considerable savings. An overall approach is needed to challenge the logic of explosive component service extension from design to removal from service for evaluation. The purpose of the effort described in this paper was to develop a service-extension approach on explosive devices used in aircraft systems, supported by actual testing of representative candidate devices, to evaluate quantitatively the effects of service, age, and degradation, and allow responsible, conservative service life determinations. Evaluated were five explosive components: rigid and flexible explosive transfer lines, one-way transfers, flexible linear shaped charges, and initiation handles. The service extension approach generated in this effort is summarized by eight recommendations. Author

**LONG TERM DEPOSIT FORMATION IN AVIATION TURBINE FUEL AT ELEVATED TEMPERATURE**

A. J. GIOVANETTI and E. J. SZETELA (United Technologies Research Center, East Hartford, CT) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p.
(Contract NAS3-24091)
(AIAA PAPER 86-0525)

An experimental characterization is conducted for the relationships between deposit mass, operating time, and temperature, in coking associated with aviation fuels under conditions simulating those typical of turbine engine fuel systems. Jet A and Suntech A fuels were tested in stainless steel tubing heated to 420-750 K, over test durations of between 3 and 730 hr and at fuel velocities of 0.07-1.3 m/sec. Deposit rates are noted to be a strong function of tube temperature; for a given set of test conditions, deposition rates for Suntech A exceed those of Jet A by a factor of 10. Deposition rates increased markedly with test duration for both fuels. The heated tube data obtained are used to develop a global chemical kinetic model for fuel oxidation and carbon deposition. O.C.

### RESEARCH ON HIGH-STRENGTH AEROSPACE ALUMINUM ALLOYS

J. T. STALEY (Aluminum Company of America, Alloy Technology Div., Pittsburgh, PA) (CASI, Annual General Meeting, 31st, Ottawa, Canada, May 28, 1984) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 31, March 1985, p. 14-29. refs

The utilization of aluminum alloys in airframe designs is discussed. The present aim in aircraft design is to save weight by decreasing density and increasing strength while maintaining corrosion resistance and increasing toughness, modulus, and fatigue resistance. Aluminum-lithium alloys and wrought powder metallurgy alloys are currently being studied for aircraft structures. Wrought powder metallurgy alloys have 30 percent higher strength than conventional alloys with improved toughness and corrosion. The application of dispersion hardened alloys for temperatures in the range 350-600 F and wrought powder metallurgy alloys for aircraft wheels is described. The fabrication and fatigue testing of the wrought powder metallurgy alloys are analyzed. The development of cost effective, lightweight, and resistant aircraft structures from metal matrix composites, aramid aluminum laminates, and superplastic 7475 is being investigated. I.F.

### HIGH STRENGTH NICKEL-PALLADIUM-CHROMIUM BRAZING ALLOYS

D. BOSE, A. RABINKIN, N. J. DE CRISTOFARO (Allied Corp., Metglas Products, Parsippany, NY), and A. DATTA (EG&G Sealol, Inc., Providence, RI) Welding Journal, Research Supplement (ISSN 0043-2296), vol. 65, Jan. 1986, p. 23-s to 29-s. refs

Nickel-palladium based filler metals are investigated as possible replacements for gold-filled filler metals, such as BAu-4, used as brazing alloys for joining aircraft engine components. Like BAu-4, the brazing temperatures of the Ni-Pd alloys are below 1010 C, making them suitable for joining critical aircraft engine components made with gamma-prime hardened superalloys, such as Inconel 718. Elevated temperature mechanical properties, corrosion behavior, and microstructural characteristics of Inconel-718 joints brazed with Ni-Pd compositions and with BAu-4 alloy are found to be comparable. ### DELAMINATION THRESHOLD AND LOADING EFFECT IN FIBER GLASS EPOXY COMPOSITE

C. BATHIAS and A. LAKSIMI (Compiegne, Universite de Technologie, France) IN: Delamination and debonding of materials . Philadelphia, PA, American Society for Testing and Materials, 1985, p. 217-237. refs

Helicopter rotor heads made of glass fiber-epoxy composite show good strength, particularly in fatigue failures. However, interlaminar defects may always grow under the effect of loading in bending. To predict the development of these plane defects, the delamination threshold and low crack growth rate were studied in double cantilever beam-type specimens calibrated by compliance. Experimentally, a delamination threshold exists below which a plane crack does not propagate, either in Mode I or Mode II testing. Fatigue loading may cause the growth of delamination between adjacent plies at a strain energy release rate Delta G(th) five times lower than the fracture energy G(c). This difference is relatively insignificant by comparison with metals, since in numerous alloys the difference can be as high as 100. This demonstrates the importance of determining a delamination threshold to evaluate the damage tolerance of the composite. Complex loadings were introduced into our tests by programming temporary overloads and sequences of loading at two stress levels during cycling. The glass fiber-epoxy composites do not show significant memory effect, but are sensitive to the load ratio R. Author

### RECENT DEVELOPMENTS IN CARBON FIBRE COMPOSITE

J. MATSUI, T. NORITA (Toray Industries, Inc., Tokyo, Japan), and M. HIRATA (Soficar, Paris, France) SAMPE Journal (ISSN 0091-1062), vol. 21, Nov.-Dec. 1985, p. 39-44. refs

To fulfill requirements of carbon fiber composite for aircraft structures, intermediate modulus (295 GPa) and higher strength (5600 MPa) carbon fiber TORAYCA T800 was developed. T800 composite shows greatly improved composite properties dominated by fiber such as tensile modulus, compressive modulus, tensile strength without hole and with hole, and through-penetration impact load. There is no effect on transverse tensile strength, compressive strengths, and shear strength with increase of fiber properties. Status of matrix resin developments is also discussed in terms of improvements in transverse cracking and compressive strength after impact. Author

### NATIONAL SAMPE TECHNICAL CONFERENCE, 17TH, KIAMESHA LAKE, NY, OCTOBER 22-24, 1985, PROCEEDINGS

Conference sponsored by the Society for the Advancement of Material and Process Engineering. Covina, CA, Society for the Advancement of Material and Process Engineering (National SAMPE Technical Conference Series. Volume 17), 1985, 736 p. For individual items see A86-21702 to A86-21758.

Among the topics discussed are: optically transparent silicon elastomers; bismaleimides; and the ablation characteristics of graphite/epoxy. Consideration is also given to the effects of thermal exposure on the structural and mechanical integrity of graphite fibers; processable polyimide matrix resins; biomedical electronics applications of materials characterization and analysis systems; and P/M titanium shape technology using the ceramic mold process. Additional topics discussed include: microstructure modification of Ti-6Al-4V casings; titanium castings for airframe applications; and heat treatment and forming considerations in processing aluminum-lithium alloys. I.H.

**A86-21707**

### CAST ALUMINUM FATIGUE PROPERTY/MICROSTRUCTURE RELATIONSHIPS

P. C. INGUANTI (United Technologies Corp., Sikorsky Aircraft, Stratford, CT) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 61-72.

The relationship between the tensile properties, fatigue properties, and the microstructure are examined for two cast aluminum alloys, A201.0 and A357.0, processed by three different foundry techniques. It is shown that A201.O-T7 has consistently high tensile properties but its fatigue strength is low due to casting flaw sensitivity. The fatigue properties of the alloy, however, can be substantially improved through foundry or post-foundry techniques eliminating shrinkage porosity. A357.O-T6 castings, which are free of large shrinkage voids, are found to have the optimum combination of tensile and fatigue properties for application to fatigue loaded components. V.L.

**A86-21710**

### OPTICALLY TRANSPARENT SILICONE ELASTOMERS

M. D. BAILE (Dow Corning Corp., Midland, MI) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 97-105. Research supported by Dow Corning Corp.

A wet process hydrophobic (WPH) silica technology is employed to prepare optically transparent silicone elastomers which embrace a unique combination of property profile. These elastomers can be cured via peroxides or hydrosilation method, in less than 30 minutes at 100 C. The unvulcanized rubber mixture can be processed easily due to its non-tacky surface and low plasticity. A wide range of mechanical properties is obtained: 25-80 Durometer, 500-1100 percent Elongation, 8.3-12.7 MPa Tensile Strength, lap shear adhesion greater than 300 psi to glass,

polycarbonate and acrylic. The optical properties are greater than 90 percent Transmission and less than 22 percent Haze for a 1.27 mm thick elastomer. The shelf life of catalyzed unvulcanized rubber mixture is seven weeks at ambient temperature and greater than seven months at 0 C. These types of elastomers can potentially satisfy important needs in the marketplace such as aircraft windshield interlayer application, thermal adsorber boiler or/photovoltaic cells, medical grade blood pump devices, catheters, elasto-optic transducers, etc.

### APPLICATIONS OF TUBULAR COMPOSITE STRUCTURES

D. P. MAASS (Advanced Composite Products, Inc., East Haven, CT) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 200-208.

This paper is intended to portray the broad range of applications for tubular composite parts. These applications are organized by means of structural function (i.e. compression columns, beams, internal pressure vessels, etc.) with specific examples in each case. The parts described, cover a broad range of designs including diameters from .125-arcmin to 16-arcmin, wall thickness from .010-in. to 1-in., materials including glass, Kevlar, oriented polyethylene, and all forms of graphite fiber, solid and sandwich wall construction, etc. The tradeoffs between the various methods for fabricating composite tubes (roll wrapped prepreg, filament winding, pultrusion, braiding, etc.) are also addressed.

### IMPACT OF COMPOSITE MATERIALS ON ADVANCED FIGHTERS

M. M. RATWANI (Northrop Corp., Aircraft Div., Hawthorne, CA) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancoment of Material and Process Engineering, 1985, p. 232-241.

The impact of composite materials on the performance, durability and life cycle costs of advanced fighter aircraft is presented in this paper. The advantages of using high strain fibers, high toughness resin and hybrids in the structural design of advanced composites are discussed. The role of stitching in retarding delamination growth in composites is shown. A brief discussion of composition repairs for combat readiness is also given.

### TITANIUM NEAR NET SHAPE COMPONENTS FOR DEMANDING AIRFRAME APPLICATIONS

R. H. WITT and A. L. FERRERI (Grumman Aerospace Corp., Bethpage, NY) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 296-305. refs

This paper deals with the viability of Hot Isostatic Pressing (HIP) Near Net Shape (NNS) titanium parts in competition with forged or cast components. The paper summarizes NNS and advanced alloy capability and experience for each process, and includes economic assessments for specific parts varying in size and complexity. Overall results show that HIP offers greatest near-term potential for producing the complex parts considered in this study.

### EFFECT OF MANUFACTURING DEFECTS AND SERVICE-INDUCED DAMAGE ON THE STRENGTH OF AIRCRAFT COMPOSITE STRUCTURES

R. A. GARRETT (McDonnell Aircraft Co., St. Louis, MO) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 325-341. refs

The effects of several types of manufacturing defects and two types of service-induced damage on the static and fatigue strength of aircraft composite structures are examined. The manufacturing defects discussed here include out-of-round holes, delaminations, porosity, improper fastener seating depth, tilted countersinks, interference fit, and multiple installation and removal cycles; the two types of service-induced damage are low energy impact damage and penetration damage. With reference to test results for carbon/epoxy panel structures, it is shown that the above manufacturing defects can be easily detected with correct nondestructive inspection techniques and that the tolerances and controls used in the fabrication and assembly of composite aircraft structures are adequate to assure uniform strength and structural performance. Techniques for reducing the low energy impact and penetration damage are suggested.

### COMPOSITE FABRICS IN A THERMAL PROTECTION APPLICATION

W. P. DOWNEY, JR. (Fairchild Burns Co., Winston-Salem, NC) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 386-399.

Increased airline passenger cabin fire hardness and increased opportunity for passenger survivability in fire scenarios are objectives of a portion of an on-going FAA regulatory program. The overall program is briefly reviewed. Fire blocking of polyurethane seat cushions with sewn slipcover liners of composite fabrics is taking place now. The stated objective of fire blocking is to provide additional cabin egress time in the event of a post crash fire. Previous small scale cabin material flammability tests are reviewed and compared to the new large scale upholstery system test required to demonstrate fire blocking capability. The performance of a fire blocking fabric is not a stand alone parameter but is greatly influenced by the specific polyurethane foam being protected and the decorative upholstery covering installed over the assembly and these factors are reviewed. Additional selection criteria, other than thermal properties, are also reviewed. The range of currently available fabrics is outlined. Many of the fabrics are of fibers such as Kevlar, nomex, glass, PBI, and carbon, most familiar in structural applications.

### ELECTRODEPOSITED PRIMER SCALE-UP AND QUALIFICATION

G. T. BECKWITH and T. POLLARD (Northrop Corp., Hawthorne, CA) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 400-409. USAF-sponsored research.

Northrop has successfully scaled up an electrodeposited, adhesive bonding primer from a three-gallon research cell to a 250-gallon pilot production tank. This primer is a modified-epoxy, water-based material that was developed jointly by Northrop and Sherwin-Williams for use with 82 C (180 F)-service adhesives. Following the successful scale-up, the primer was fully qualified to the MMM-A-132A, MIL-A-25463B, and Fairchild S-F501 adhesive bonding specifications. In the qualification, specimens were fabricated with Dexter-Hysol EA-9628 adhesive on aluminum adherends that were primed cathodically at low voltage (40 to 45 volts). Two production lots of electrodeposited primer were prepared by Sherwin-Williams and evaluated at Northrop. Control specimens were also prepared with BR-127 and EA-9268 adhesive.

Excellent results were obtained with values that were 40 percent to 160 percent above the specification requirements. Author

### IMPROVED TEMPERATURE RESISTANT SEALANTS FOR COMPOSITE & ADHESIVE BONDED FUEL-TANK STRUCTURES

E. M. BROWN, A. F. SHARABY, and T. M. CLARK (Products Research and Chemical Corp., Glendale, CA) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 420-427.

More stringent requirements for aircraft sealants have taxed existing materials both from an increased temperature and overall performance need. More recent manufacturing processes require the use of heat for adhesive bonding, and curing composites. In addition, aircraft performance has increased the requirements for sealant stability at higher operating temperatures. The result has been a new family of aerospace sealants that accommodate these demands. These sealants show a two fold retention of physical properties over existing materials. They are compatible with elevated temperature cure cycles and immediate exposure to heat. They may also be used in elevated temperature applications in faying surfaces. The characteristics of these sealants are presented in this paper. Author

### FUEL RESISTANT COATINGS FOR APPLICATIONS IN INTEGRAL TANKS & BLADDER FUEL CELLS

E. M. BROWN and S. RANDAZZO (Products Research and Chemical Corp., Glendale, CA) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 428-432.

With the advent of new materials and processes in the aerospace industry, a number of coating applications for fuel containment have been identified. Several new coatings based on Permapol P-3, a unique fuel resistant polymer, show promise in these aircraft applications. These materials provide a variety of chemical structures, physical characteristics and are summarized in this presentation. Author

**A86-21741**

### ADVANCES IN P/M TITANIUM SHAPE TECHNOLOGY USING THE CERAMIC MOLD PROCESS

V. K. CHANDHOK, J. H. MOLL, C. F. YOLTON, and G. R. MCINDOE (Colt Industries, Crucible Research Center, Pittsburgh, PA) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 495-506. refs

A study was conducted to improve and define the dimensional control of titanium alloy turbine engine rotors produced using prealloyed powder, the ceramic mold process, and hot-isostatic-pressing. Room temperature and elevated temperature properties are presented and compared to conventional forgings and castings. The results show that P/M process is capable of producing rotors with the combined near-net shape capability of castings and the high mechanical property capability of forgings. Author

### UNIQUE TOOLING AND MANUFACTURING APPROACH FOR LARGE ADVANCED COMPOSITE AIRCRAFT STRUCTURE

J. S. WINEGAR (Fiber Technology Corp., Provo, UT) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 507-511.

This paper presents a review of innovative tooling and manufacturing concepts which can be adapted for use in a number of large composite structures. Using filament winding as the primary source of fiber deposition, the method has been successfully developed in a variety of large aircraft parts such as a 10' diameter cowling made as a solid wall graphite/epoxy structure with honeycomb hat ring frames. A sandwich-wall graphite/epoxy fuselage for a general business airplane has been demonstrated and is ready for production. Current government and commercially sponsored programs suggest that new and innovative tooling and manufacturing methods must be developed to make such structures a reality. Author

### CURRENT AND POTENTIAL USAGE OF TITANIUM CASTINGS FOR AIRFRAME APPLICATIONS

R. R. BOYER (Boeing Commercial Airplane Co., Seattle, WA), W. F. SPURR, and J. M. EDWARDS (TiTech International, Inc., Pomona, CA) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 624-634.

Only recently have titanium castings begun to see widespread acceptance of their use for aircraft and missile applications. Due to its relatively high cost, the selection of titanium in general and titanium castings in specific requires analysis of a number of tradeoffs. Titanium castings are unique in that they can possess properties equivalent to wrought titanium yielding advantages over other alloy systems in strength to weight ratio, corrosion resistance and high temperature performance. Proper design can maximize their cost effectiveness by utilizing net shape capability to minimize both machining and fabrication operations. A number of current titanium casting applications illustrate the various criteria upon which their selection as production method of choice is based. Finally, higher strength titanim beta alloys such as Ti-15-3-3-3 and Ti-38-6-44 demonstrate excellent potential for future applications. Author

### FLAME TEMPERATURE ESTIMATION OF CONVENTIONAL AND FUTURE JET FUELS

O. L. GULDER (National Research Council of Canada, Div. of Mechanical Engineering, Ottawa) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 5 p. refs
(ASME PAPER 85-GT-31)

An approximate formula is presented by means of which the adiabatic flame temperature of jet fuel-air systems can be calculated as functions of pressure, temperature, equivalence ratio, and hydrogen to carbon atomic ratio of the fuel. The formula has been developed by fitting of the data from a detailed chemical equilibrium code to a functional expression. Comparisons of the results from the proposed formula with the results obtained from a chemical equilibrium code have shown that the average error in estimated temperatures is around 0.4 percent, the maximum error being less than 0.8 percent. This formula provides a very fast and easy means of predicting flame temperatures as compared to thermodynamic equilibrium calculations, and it is also applicable to diesel fuels, gasolines, pure alkanes, and aromatics as well as jet fuels. Author

**A86-22022#**
**THE QUANTIFICATION AND IMPROVEMENT OF THE THERMAL STABILITY OF AVIATION TURBINE FUEL**
J. S. MILLS and D. R. KENDALL (Shell Research, Ltd., Thornton Research Centre, Chester, England) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 6 p. refs
(ASME PAPER 85-GT-33)

The rig performance of aircraft fuels are evaluated. The test rig and experimental procedures for testing eleven fuels in a heat exchanger are described. Fuel performance limits between 125-210 C are obtained; it is observed that an increase in operating temperature results in an increase in operational difficulties for certain fuels. The influence of oxidation of fuel on the fuel's performance is examined. It is concluded that the performance of fuels depends on the initiation of radical oxidation reactions and sulfur content. The effect of metals on the oxidation process and fuel is investigated. The metals catalyze the oxidation reactions resulting in low fuel stability. The doping of fuels with metal deactivating additives to reduce the catalytic effect of metals is studied. The additive is effective in reducing the catalyzation; however, the chelates formed contain some residual catalytic activity. I.F.

**A86-22062#**
**STRAIN ISOLATED CERAMIC COATINGS FOR GAS TURBINE ENGINES**
R. P. TOLOKAN, J. B. BRADY, and G. P. JARRABET (Brunswick Corp., Technetics Div., DeLand, FL) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 6 p. refs
(ASME PAPER 85-GT-96)

Plasma sprayed ceramic coatings are used in gas turbine engines to improve component temperature capability and cooling air efficiency. Strain isolated ceramic coatings offer improved coating life and increased insulating capability. A low modulus fiber metal strain isolator between ceramic and metal backing acts to reduce the stress on the ceramic during thermal cycling. Strain isolated coatings can tolerate greater ceramic thickness and broader operating conditions than nonstrain isolated coatings when subjected to thermal shock. Ceramic coatings are durable only within a narrow range of operating conditions. Coating designs should be based on real operating conditions for success. Thermal shock testing is useful for evaluating ceramic coatings if test and sample design are representative of the intended application. Author

**RESEARCH ON ANTIMISTING FUEL FOR SUPPRESSION OF POSTCRASH AIRCRAFT FIRES**
V. SAROHIA, P. PARIKH, A. YAVROUIAN, and E. MATTHYS (California Institute of Technology, Jet Propulsion Laboratory, Pasadena) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 20 p. refs
(Contract NAS7-918; NASA ORDER RE-152-293; DOT-FA03-80-A-00215)
(AIAA PAPER 86-0573)

Recent experimental results in the field of post-crash aircraft fire suppression are reviewed, with emphasis given to antimisting kerosene fuel (AMK). Findings in three major areas of study are presented, including: rheological studies (skin friction, and heat transfer); fuel breakup processes and nozzle spray combustion; and the development of inline blenders for production of AMK at the refueling point. An interpretation of the results of the FAA/NASA Controlled Impact Demonstration of AMK fuel is also presented. It is concluded that AMK is a sound concept and offers several advantages over conventional fuels in any crash scenario involving post-crash fires. I.H.

**THE TWO-FLUID MODEL OF TURBULENT COMBUSTION APPLIED TO AN IDEALISED ONE-DIMENSIONAL, UNSTEADY, CONFINED, PRE-MIXED FLAME**
J. Z. Y. WU Aug. 1984 59 p refs
(PDR/CFDU/IC/21) Avail: NTIS HC A04/MF A01

The two-fluid model of turbulent combustion was applied to a one-dimensional, unsteady, confined, premixed flame with idealized initial and boundary conditions. The results show that steady oscillations may occur after the steady-state flame is disturbed. A systematic, parametric study is performed to establish instability regions. The results indicate a possible mechanism of oscillatory burning in, for example, afterburner systems for aircraft jet engines. Author (ESA)

A need exists to keep aircraft operators and maintenance personnel aware of the science and technology of corrosion as it applies to aircraft structures. Information is provided on the aircraft operating environment, corrosion theory, common airframe materials and their response to corrosion, the detection of corrosion, and methods employed to control corrosion in aircraft structures and materials. Also given are case histories of the deterioration or failure of components in typical aircraft and the means of detection are detailed and the remedical action taken. Microbiological corrosion is also discussed. The handbook is intended to assist in the early diagnosis of developing corrosion problems and in the selection of appropriate corrective measures. A composite mold to manufacture carbon reinforced expoxy matrix composite elements for the aircraft industry is studied. The working temperature for curing is 175C. The tests were carried out either using preimpregnated composites or manually impregnated composites. The study shows that the molds do not differ significantly from the models, that the deformation is low after several autoclave cycles, and that there are consistent advantages regarding weight and thermal inertia. The design of an air inlet covering with an average diameter of 2200 mm and length varying between 330 and 510 mm is discussed. The purpose it to show how an asymmetric element can be manufactured by filament winding, using composite materials. The choice of winding procedure is analyzed and all the manufacturing steps are described. The analytical verification of the behavior under external pressure gives results within the specifications. **LUBRICATION AND PERFORMANCE OF HIGH-SPEED ROLLING-ELEMENT BEARINGS**
E. V. ZARETSKY, F. T. SCHULLER, and H. H. COE (NASA, Lewis Research Center, Cleveland, OH) Lubrication Engineering (ISSN 0024-7154), vol. 41, Oct. 1985, p. 725-732. Previously announced in STAR as N85-21658. refs

Trends in aircraft engine operating speeds have dictated the need for rolling-element bearings capable of speeds to 3 million DN. A review of high-speed rolling-element bearing state-of-the-art performance and lubrication is presented. Through the use of under-race lubrication and bearing thermal management bearing operation can be obtained to speeds of 3 million DN. Jet lubricated ball bearings are limited to 2.5 million DN for large bore sizes and to 3 million DN for small bore sizes. Current computer programs are able to predict bearing thermal performance. ### FATIGUE LIFE PREDICTION UNDER COMPLEX LOAD USING LOCAL STRAIN APPROACH AND RELATIVE MINER'S RULE

A. LUO (Aviation Industry Department, People's Republic of China) and F. WU (Northwest Polytechnic University, Xian, People's Republic of China) Acta Mechanica Solida Sinica, Sept. 1985, p. 327-337. In Chinese, with abstract in English. refs

Crack formation life predictions for two kinds of central notched specimens using local strain approach and relative Miner's (1945) rule (i.e., relative linear cumulative damage rule) are described and discussed in this paper. Crack formation lives of these two kinds of specimens under Fighter Aircraft Loading Standard for Fatigue Evaluation load spectra are obtained. The calculation results were compared with the fatigue testing results, and it was found that the method using a finite element analysis to predict crack formation lives is better than the modified Neuber's (1961) rule. In addition, the accuracy of predicting fatigue lives is considerably improved when a local strain approach combined with the relative Miner's rule is used, instead of the commonly used Miner's rule. ### MEASUREMENT OF ELASTIC-PLASTIC STRAIN FIELD AT THE CURVE SURFACE CRACK TIP

P. FENG and H. WANG (Institute for Aircraft Structural Strength, People's Republic of China) Acta Mechanica Solida Sinica, Sept. 1985, p. 346-352. In Chinese, with abstract in English. refs

In this paper a new technique of specimen grating copy is described. Combining the technique of spatial filtering, fringe multiplication and image processing, it can be used to measure the elastic-plastic strain field at the curve surface crack tip of axles, pivoting wings, pillar sheets and cone shells. This new technique can even be used to measure the surface strain field of rotary axles, rotary flywheels and rotary wings. Author

### SYNCHRONIZING CHARACTERISTICS OF A LARGE VARIABLE FREQUENCY STARTING SYSTEM

J. K. BRANDON (USAF, Arnold Engineering Development Center, Arnold Air Force Station, TN) IN: SOUTHEASTCON '84; Proceedings of the Conference, Louisville, KY, April 8-11, 1984 . New York, Institute of Electrical and Electronics Engineers, 1984, p. 339-342.

The Aeropropulsion Systems Test Facility (ASTF) is a new jet engine test facility presently under construction by the U.S. Air Force near Tullahoma, Tennessee. The design utilizes a relatively unique variable frequency starting system (VFSS) for startup of the various large electrical drive systems associated with ASTF. During the design phase, one of the major obstacles was to identify the most advantageous method for automatically transferring the large synchronous motors from the VFSS to the main power system. This paper describes the synchronizing techniques and equipment chosen for the ASTF variable frequency starting system. Author

### REPEATABILITY OF MIXED-MODE ADHESIVE DEBONDING

R. A. EVERETT, JR. (NASA, Langley Research Center; U.S. Army, Structures Laboratory, Hampton, VA) and W. S. JOHNSON (NASA, Langley Research Center, Hampton, VA) IN: Delamination and debonding of materials . Philadelphia, PA, American Society for Testing and Materials, 1985, p. 267-281. Previously announced in STAR as N84-19565. refs

The repeatability of debond growth rates in adhesively bonded subjected to constant-amplitude cyclic loading was studied. Debond growth rates were compared from two sets of cracked-lap-shear specimens that were fabricated by two different manufacturers and tested in different laboratories. The fabrication method and testing procedures were identical or both sets of specimens. The specimens consisted of aluminum adherends bonded with FM-73 adhesive. Critical values of strain-energy-release rate were also determined from specimens that were monotonically loaded to failure. The test results showed that the debond growth rates for the two sets of specimens were within a scatter band which is similar to that observed in fatigue crack growth in metals. Cyclic debonding occurred at strain-energy-release rates that were more than an order of magnitude less than the critical strain-energy-release rate in static tests. Author

### THERMOGRAPHIC INSPECTION OF CARBON EPOXY STRUCTURES

D. J. HILLMAN and R. L. HILLMAN (McDonnell Aircraft Co., St. Louis, MO) IN: Delamination and debonding of materials . Philadelphia, PA, American Society for Testing and Materials, 1985, p. 481-493.

In-service damage to composite fighter aircraft structures is normally readily observed visually; often very serious damage can be identified as such by the visual observer. However, it is impossible to see whether or not nondestructive inspection (NDI) is warranted at sites consisting solely of surface scratches and dents because of the possibility of impact damage and other damages which appear superficial but may be significant. The tendency, therefore, has been to quantitatively inspect every dent and scratch observed on composite structures during field NDI to avoid overlooking a serious damage site. The purpose of the efforts reported in this paper is to eliminate this practice by providing a fast, inexpensive, large-area NDI tool capable of screening out superficial damage from serious damage. ### A NEW METHOD OF ANALYZING WAVE PROPAGATION IN PERIODIC STRUCTURES - APPLICATIONS TO PERIODIC TIMOSHENKO BEAMS AND STIFFENED PLATES

D. J. MEAD (Southampton, University, England) Journal of Sound and Vibration (ISSN 0022-460X), vol. 104, Jan. 8, 1986, p. 9-27. refs

A response function is found for an infinite, uniform, one-dimensional structure which is subjected to an array of harmonic forces or moments, spaced equidistantly, and which have a constant phase or ratio between any adjacent pair. Receptance functions are derived for these 'phased arrays'. They are used to set up a general determinantal equation for the propagation constants of the infinite structure when it is made periodic by the addition of an infinite set of regular constraints. They are also used to set up equations for the response of the structure to a convected harmonic pressure field. The method enables the equations for the propagation constants and for the response to convected loading to be set up with much greater facility than by earlier methods. It only requires a knowledge of the response function of the infinite uninterrupted structure under a single-point harmonic force or moment. The general equation for the propagation constants is used to study (1) a simply supported periodic Timoshenko beam, and (2) a parallel plate with periodic beam-type stiffeners. Some calculated propagation constants are presented and discussed. The periodic plate results are relevant to integrally stiffened skins of the type used in aeroplanes. Author

### A SHARED SATELLITE SYSTEM WOULD SATISFY MANY FUTURE AVIATION NEEDS

J. D. KIESLING and R. E. ANDERSON ICAO Bulletin, vol. 40, Nov. 1985, p. 15-20.

The development of a continental mobile satellite system for aircraft communication is proposed. The system is to provide communication and surveillance for air traffic control and aeronautical operational control. The two-satellite ranging and position fixing of the satellite system are analyzed. The system architecture requires consideration of satellite earth coverage, a frequency and polarization plan, satellite and mobile power and power density, and modulation standards. The use of spot beams and frequency reuse is examined, and diagrams of coverage areas and frequency reuse are presented. Examples of aviation system and mobile satellite system frequency plans are provided.

Differences in satellite characteristics, such as antenna gain, transmitter powers and receiver sensitivities, and mobile antenna gains and powers are discussed. The components and requirements for a typical satellite transponder concept, in particular an aircraft-mounted antenna, are described. I.F.

### COMPUTATIONAL METHODS IN VISCOUS FLOWS

W. G. HABASHI, ED. (Concordia University, Montreal, Canada) Swansea, Wales, Pineridge Press (Recent Advances in Numerical Methods in Fluids. Volume 3), 1984, 678 p. For individual items see A86-21027 to A86-21044.

The papers presented in this volume focus on new finite difference and finite element approaches for both incompressible and compressible Navier-Stokes equations, with attention also given to viscous-inviscid interaction problems. Particular topics discussed include some aspects of finite element approximations of incompressible viscous flows, numerical solution of the compressible viscous flow field about a complete aircraft in flight, and finite difference simulation of unsteady interactive flows. Papers are also presented on calculation of separated flows by viscous-inviscid interaction, turbulent flow and heat transfer in coupled solid/fluid systems, and the effect of the solid particle size in two-phase flow around a plane cylinder. ### A SYNTHETIC APERTURE RADAR (SAR) FOR COMMERCIAL APPLICATIONS

B. L. BULLOCK (Intera Technologies, Ltd., Calgary, Canada) and A. KOZMA (Michigan, Environmental Research Institute, Ann Arbor) IN: International Symposium on Remote Sensing of Environment, 18th, Paris, France, October 1-5, 1984, Proceedings. Volume 3 . Ann Arbor, MI, Environmental Research Institute of Michigan, 1985, p. 1733-1742. refs

Studies leading to the design specifications and subsequent development of a SAR built solely for commercial applications are described. Background searches were made of potential users and their requirements and the corresponding technology. The system developed is called STAR 1 (for Sea-Ice and Terrain Assessment Radar); it is an X-band system installed in a light turboprop aircraft. The data are digitally processed in real time aboard the aircraft and the image is telemetered to a ground station for immediate use. The system is currently operational and has performed a number of tasks including support of arctic drilling and engineering, iceberg detection, arctic transportation, and terrain surveys. D.H.

### COMPARISON OF CALCULATED AND MEASURED HEIGHT PROFILES OF TRANSVERSE ELECTRIC VLF SIGNALS ACROSS THE DAYTIME EARTH-IONOSPHERE WAVEGUIDE

E. C. FIELD, JR., C. R. WARBER (Pacific-Sierra Research Corp., Los Angeles, CA), P. A. KOSSEY, E. A. LEWIS, and R. P. HARRISON (USAF, Rome Air Development Center, Bedford, MA) Radio Science (ISSN 0048-6604), vol. 21, Jan.-Feb. 1986, p. 141-149. refs

Airborne VLF antennas radiate energy that propagates via both transverse electric (TE) and transverse magnetic (TM) modes in the earth-ionosphere waveguide. In order to compare the structure of such signals, measurements were made using rocket probes launched from Wallops Island, Virginia. The probes measured TE and TM fields at all altitudes between the ground and the base of the ionosphere. The nearly horizontal airborne transmitting antenna radiated a TE signal that was stronger than its TM signal at altitudes above about 10 km. The signals comprised one or more well-defined TE or TM waveguide modes. Calculated height profiles agree well with the measured ones and correctly reproduce details of profile structure caused by interaction between two or more modes. Author

### SPF ALUMINUM - A FIRST FOR THE S-76B HELICOPTER

R. FIORE and M. SCHWARTZ (United Technologies Corp., Sikorsky Aircraft Div., Stratford, CT) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 88-96.

Superplastic forming (SPF) of aluminum, basically a low strain rate hot forming process employing specially processed sheet material, permits the forming of complex shapes in one operation usually with considerable cost savings over conventional manufacturing methods. The ability to form complex, one-piece parts is due to the inherent characteristics of the process and the fine grained material which is used. Whereas most metals fracture at strains far below 100 percent, in SPF, elongations of 500-1200 percent are easily obtainable. SPF now provides the manufacturing capability for making complex parts, normally requiring composite lay-ups or welded assemblies, at greatly reduced cost. Sikorsky Aircraft has used this technology, and has received FAA approval to replace two Kevlar and fiberglass parts on the S-76B commercial helicopter at substantial cost savings without a weight penalty or the necessity for a design change. This is the first SPF aluminum production application on an American made helicopter. Author

### REQUIREMENTS FOR TAILORING OF MATERIAL PROPERTIES OF VISCOELASTICALLY DAMPED BONDED LAMINATES IN AIRCRAFT STRUCTURES

K. B. SANGHA and S. N. VACCA (LTV Aerospace and Defense Co., Vought Aero Products Div., Dallas, TX) IN: National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings . Covina, CA, Society for the Advancement of Material and Process Engineering, 1985, p. 135-146. refs

Adhesively bonded laminates have been used for several years in the aerospace industry. Over two decades ago, their potential as noise and vibration damping mechanisms was recognized. With major new advances in materials and processes technology of adhesives, one is confronted with a plethora of adhesives that can be used for an application. This paper outlines some requirements of adhesive properties to be effective damping materials. Parameter variations are used to emphasize the importance of optimal selection of the dynamic properties of an adhesive for each application. The influence of frequency, temperature and strain amplitude is recapitulated, and their relative influences are delineated. The influence of altering the quantity of some constituents of an adhesive on damping effectiveness is presented through test data. Author

**A86-21826**

### SYMPOSIUM GYRO TECHNOLOGY 1984; PROCEEDINGS OF THE SYMPOSIUM, UNIVERSITAET STUTTGART, WEST GERMANY, SEPTEMBER 11, 12, 1984

H. SORG, ED. (Stuttgart, Universitaet, West Germany) Stuttgart/Duesseldorf, Universitaet Stuttgart/Deutsche Gesellschaft fuer Ortung und Navigation, 1984, 455 p. For individual items see A86-21827 to A86-21843.

Among the topics discussed are: drift and scale factor tests on the SEL fiber gyro; integrated optical rate sensor development; and the beam geometry of a ring laser gyro in relation to its performance. Consideration is also given to: a fast filtering technique for measuring random walk in a laser gyro; vibratory gyroscopic sensors; a redundant strapdown reference for advanced aircraft flight control systems; and a low-cost piezoelectric rate/acceleration sensor. Additional topics include: an inertial guidance system for a Low-Earth-Orbit (LEO) vehicle; and signal disturbance effects in a strapdown northfinder. I.H.

**AIRBORNE COMMUNICATIONS RECONSTITUTION EXPERIMENTS**

G. A. DESBRISAY, B. C. FAIR, and M. S. FRANKEL (SRI International, Advanced Information-Technology Applications Center, Menlo Park, CA) IN: EASCON '84; Proceedings of the Seventeenth Annual Electronics and Aerospace Conference, Washington, DC, September 10-12, 1984 . New York, Institute of Electrical and Electronics Engineers, 1984, p. 311-319. refs

As a result of the development of advanced modern weapon systems and the high mobility of forces during battle, military forces will face a highly dynamic environment in future confrontations. The present paper is concerned with investigations regarding a survivable, Strategic Air Command (SAC) Command and Control environment. The environment considered depends upon a highly survivable communication system and upon redundantly distributed, automatically updated databases. In mid-1980, the Strategic Command, Control, and Communications (CCC) Testbed was created. The network technologies which are being developed in the CCC Testbed are rapidly approaching the point where they can provide the required capabilities. G.R.

**CAD/CAM DESIGNER - JACK OF ALL TRADES**

C. F. HERNDON and R. L. GALLO (General Dynamics Corp., Fort Worth, TX) Aerospace America (ISSN 0740-722X), vol. 24, Jan. 1986, p. 52-54, 56.

Aerospace design engineers are increasingly required to have more extensive knowledge of CAD/CAM tooling and manufacturing methods, in order to ensure that datasets can yield error-free components and assemblies. For structural concept design, engineers will work at the same CAD/CAM workstation on which the final component will be defined, controlling methods that yield the optimum solution for each member of a structural system from the viewpoints of both weight (for given strength) and producibility. O.C.

**A86-21996*** National Aeronautics and Space Administration. Marshall Space Flight Center, Huntsville, Ala.

**MEASUREMENTS OF ROTATING BUBBLE SHAPES IN LOW-GRAVITY ENVIRONMENT**

F. LESLIE (NASA, Marshall Space Flight Center, Huntsville, AL) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 161, Dec. 1985, p. 269-279. NASA-supported research. refs

Measurements of rotating equilibrium bubble shapes in the low-gravity environment of a free-falling aircraft are presented. Emphasis is placed on bubbles which intersect the container boundaries. These data are compared with theoretical profiles derived from Laplace's formula and are in good agreement with the measurements. The interface shape depends on the contact angle, the radius of intersection with the container, and the parameter F, which is a measure of the relative importance of centrifugal force to surface tension. For isolated bubbles F has a maximum value of 1/2. A further increase in F causes the bubble to break contact with the axis of rotation. For large values of F the bubble becomes more cylindrical and the capillary rise occurs over a thinner layer in order that the small radius of curvature can generate a sufficient pressure drop to account for the increased hydrostatic contribution. Author

**FULL COVERAGE DISCRETE HOLE FILM COOLING - THE INFLUENCE OF HOLE SIZE**

G. E. ANDREWS, A. A. ASERE, M. L. GUPTA, and M. C. MKPADI (Leeds, University, England) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 8 p. refs

(Contract SERC-GR/B/00336; SERC-GR/B/67827)

(ASME PAPER 85-GT-47)

The influence of hole size and hence blowing rate on full coverage discrete hole wall cooling for gas turbine combustion chamber applications was investigated. Two temperature conditions were used first, a 750 K gas temperature and 300 K coolant, and secondly a realistic combustor primary zone conditions of 2100 K flame temperature and 700 K coolant. It was shown that a large hole size resulted in a significant improvement in the overall cooling effectiveness due to a reduced film heat transfer coefficient. At high temperature the cooling effectiveness was reduced due to radiative heat transfer from the flame gases. At low coolant flow large temperature increases of the coolant occurred within the wall and approached the transpiration situation. Author

**A REVIEW AND ANALYSIS OF BOUNDARY LAYER TRANSITION DATA FOR TURBINE APPLICATION**

R. E. GAUGLER (NASA, Lewis Research Center, Cleveland, OH) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 8 p. Previously announced in STAR as N85-10306. refs

(ASME PAPER 85-GT-83)

A symposium on transition in turbines was held at the NASA Lewis Research Center. One recommendation of the working groups was the collection of existing transition data to provide standard cases against which models could be tested. A number of data sets from the open literature that include heat transfer data in apparently transitional boundary layers, with particular application to the turbine environment, were reviewed and analyzed to extract transition information from the heat transfer data. The data sets reviewed cover a wide range of flow conditions, from low speed, flat plate tests to full scale turbine airfoils operating at simulated turbine engine conditions. The results indicate that free stream turbulence and pressure gradient have strong, and opposite, effects on the location of the start of transition and on the length of the transition zone. R.S.F.

**INTERDEPENDENCE OF CENTRIFUGAL COMPRESSOR BLADE GEOMETRY AND RELATIVE FLOW FIELD**

H. KRAIN (DFVLR, Institut fuer Antriebstechnik, Cologne, West Germany) ASME, International Gas Turbine Conferences and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 7 p. refs

(ASME PAPER 85-GT-85)

The influence of the impeller blade geometry on the calculated relative flow field has been studied by means of an impeller design program available at DFVLR (Krain, 1984). Several geometrical parameters were varied, however, the meridional channel geometry was always kept constant. By this approach the blade wrap angle has been found to react significantly on the relative flow which is illustrated by comparing two designs with different wrap angles. Primarily in the hub/leading edge area a better boundary layer flow connected with a reduction of blade loading was obtained by increasing the wrap angle. But also in the shroud/pressure side area the increased blade looping attributed to an additional flow stabilization. Author

**A86-22070#**

**HEAT TRANSFER MEASUREMENTS WITH FILM COOLING ON A TURBINE BLADE PROFILE IN CASCADE**

F. G. HORTON, D. L. SCHULTZ (Oxford University, England), and A. E. FOREST (Rolls-Royce, Ltd., Derby, England) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 10 p. Research supported by the Ministry of Defence (Procurement Executive) and Rolls-Royce, Ltd. refs

(ASME PAPER 85-GT-117)

Heat transfer measurements with film cooling have been made on a gas turbine rotor profile in a cascade at engine representative operating conditions. The blade temperature was varied independently to investigate the scaling of heat transfer coefficient, and a superposition model was found to correlate the data. Contrasting results are presented for films on the two surfaces, along with predictions from a two-dimensional boundary layer method. Author

**A86-22071#**

**INVERSE DESIGN OF COOLANT FLOW PASSAGE SHAPES WITH PARTIALLY FIXED INTERNAL GEOMETRIES**

S. R. KENNON and G. S. DULIKRAVICH (Texas, University, Austin) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 10 p. refs

(ASME PAPER 85-GT-118)

A method has been developed for the design and analysis of complex coolant flow passage shapes in internally cooled turbine engines. The method is particularly applicable to turbine airfoil cascade inverse design but may also be applied to the design of other nonadiabatic boundaries such as missile cone tips and internal combustion engine cylinder. The method makes it possible to specify and fix the temperature or the heat flux at the turbine airfoil outer surface, together with the desired temperature at the coolant/blade interfaces. Coupled with an appropriate flow solver and stress analysis code, the method provides accurate estimates of the blade surface temperature and heat flux distribution in the coolant passage. A first order panel method is used to solve the Laplace equations for steady heat conduction within the solid portions of the hollow blade. In order to illustrate the efficiency of the method, numerical results are presented for the case of a turbine airfoil having three coolant holes. The discretized temperature contours for the inner and outer parts of the blade are illustrated in graphic form. I.H.

**DEVELOPMENT OF A DESIGN MODEL FOR AIRFOIL LEADING EDGE FILM COOLING**

A. R. WADIA and D. A. NEALY (General Motors Corp., Allison Gas Turbine Div., Indianapolis, IN) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 12 p. refs

(ASME PAPER 85-GT-120)

A series of experiments on scaled cylinder models having injection through holes inclined at 20, 30, 45, and 90 degrees are presented. The experiments were conducted in a wind tunnel on several stainless steel test specimens in which flow and heat transfer parameters were measured over simulated airfoil leading edge surfaces. On the basis of the experimental results, an engineering design model is proposed that treats the gas-to-surface heat transfer coefficient with film cooling in a manner suggested by Luckey and L'Ecuyer (1981). It is shown that the main factor influencing the averaged film cooling effectiveness in the showerhead region is the inclination of the injection holes. The effectiveness parameter was not affected by variations in the coolant-to-gas stream pressure ratio, the freestream Mach number, the gas to coolant temperature ratio, or the gas stream Reynolds number. Experience in the wind tunnel tests is reflected in the design of the model in which the coolant side heat transfer coefficient is offset by a simultaneous increase in the gas side film coefficient. The design applications of the analytical model are discussed, with emphasis given to high temperature first stage turbine vanes and rotor blades. I.H.

**INVESTIGATION OF JET-FILMING AIRBLAST ATOMIZER**

Q.-S. ZHAO and Y.-F. YU (Beijing Institute of Aeronautics and Astronautics, People's Republic of China) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 7 p. refs

(ASME PAPER 85-GT-185)

The jet-filming airblast atomizer is another kind of airblast atomizer differing from a prefilming airblast atomizer. Its atomizing mechanism and performance were investigated experimentally and theoretically. The effects of design parameters on the mean droplet size SMD and the thickness of the liquid film were obtained. The inherent mechanism consisting of three atomizing processes was proved. From this, the performance curves of atomization and thickness of liquid film can be explained and the principles of design of this kind of atomizer were derived. The results obtained show that the performance of the jet-filming airblast atomizer is better than that of the prefilming type, and it is simple in design. So it is advantageous to apply this kind of atomizer to an advanced aircraft engine. Author

**STRUCTURAL AND MATERIAL CONSIDERATIONS FOR ADVANCED FIGHTERS**

T. R. ROONEY (Northrop Corp., Aircraft Div., Hawthorne, CA) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 8-1 to 8-6.

Current and emerging structural technologies provide the opportunity to make a quantum jump in the design of next generation aircraft. The impact of new materials and structural concepts on the performance, producibility and life cycle costs of advanced fighters is discussed. The expected applications of advanced materials tehnologies in metallics, composites and hybrid structures are described. Author

**SUPERPLASTICALLY-FORMED/DIFFUSION-BONDED M TECHNOLOGY TRANSITION CASE STUDY**

E. D. BOUCHARD and J. P. SORENSEN (McDonnell Aircraft Co., St. Louis, MO) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 19-1 to 19-4.

The principles of the superplastic forming/diffusion bonding (SPF/DB) of titanium and of the low-cost structural concepts employed in the new F-15E aft fuselage are described. Application of the SPF/DB of Ti technology in the F-15E aft fuselage provides a good case study in the transition of the SPF/DB Ti research and development program from laboratory scale to production state. It is shown that use of the new technology will result in a significant reduction of acquisition cost, life-cycle costs, reduction in structural weight, and improved durability and will open the door for further application on new aircraft, such as the Advanced Tactical Fighter. I.S.

**TRANSITION OF ADVANCED MATERIALS AND STRUCTURES - SINGLE CRYSTAL BLADES**

M. M. ALLEN and D. S. HALFPAP (United Technologies Corp., Pratt and Whitney, West Palm Beach, FL) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 20-1 to 20-4.

The paper discusses the generic path of manufacturing technology R&D implementation using single crystal turbine blades as an example. Single crystal turbine airfoils represent an evolutionary outgrowth of P&W developed directional solidification process which significantly contributed to gas turbine fuel efficiency and performance. The following key elements of implementation are dsicussed: Technology payoff, laboratory specimen and rig testing; engine testing and transition to production. Author

**IMPLICATIONS OF NEW AIRCRAFT AVIONICS RELIABILITY PERFORMANCE**

M. E. MOORHEAD (Rockwell International Corp., Collins Div., Melbourne, FL) IN: Environmental integration technology today for a quality tomorrow; Proceedings of the Thirtieth Annual Technical Meeting, Orlando, FL, May 1-3, 1984 . Mount Prospect, IL, Institute of Environmental Sciences, 1984, p. 232-235.

An evaluation is made of MTBF values projected for avionics operating under environmental conditions typical of state-of-the-art 'digital' aircraft. Equipment reliability levels obtained during the fist year of operational experience with the B 767 and B 757 airliners are presented and compared with levels characteristic of previous avionic failure rates. Theoretical reliability levels based on existing MIL-HDBK-217 failure rate curves and acceleration factors are related to demonstrated performance levels, in order to identify points of correlation as well as discrepancies. O.C.

**THE AIR FORCE APPROACH TO ENVIRONMENTAL STRESS SCREENING**

E. J. WESTCOTT (USAF, Systems Command, Andrews AFB, MD) IN: Environmental integration technology today for a quality tomorrow; Proceedings of the Thirtieth Annual Technical Meeting, Orlando, FL, May 1-3, 1984 . Mount Prospect, IL, Institute of Environmental Sciences, 1984, p. 385, 386.

Use of environmental stress screening (ESS) by the USAF Systems Command to improve the quality of the systems and decrease the life-cycle costs of systems acquisition and development is described. A military ESS standard, which will provide for tailoring and application, is being developed and will be issued in 1984 for the use of ESS on all systems during full-scale development and production phases. Cost-effective tailoring and selection of such stress levels, which will stimulate failure modes consistent with the expected use environment, will be continually monitored. Combined environmental reliabilty (CERT) testing will be used as a basis for TAAF, reliability demonstration, and reliability acceptance. I.S.

**CALCULATION OF MISALIGNMENT ERROR OF MULTI-JOINT HOLES OF WING TO FUSELAGE**

Z. CUI (Shenyang Aircraft Corp., People's Republic of China) Acta Aeronautica et Astronautica Sinica, vol. 6, Aug. 1985, p. 385-392. In Chinese, with abstract in English.

An error dimensional chain equation for misalignment of multijoint holes of wing to fuselage is discussed in this paper. The equation is derived on the basis of error dimensional chain theory and according to the principle that between any two points a straight line may be drawn, but among more than two points only a broken line can be made. This equation can estimate the coaxiality of joints and the misalignment error in the center location of fork-ear fitting. Therefore, some suggestions for improvement of unjust joining specifications are offered and the evaluation of construction compensation is given. Author

**THE AUTOMATED, ADVANCED MATRIX FMEA TECHNIQUE**

P. L. GODDARD and R. W. DAVIS (Hughes Aircraft Co., Fullerton, CA) IN: Annual Reliability and Maintainability Symposium, Philadelphia, PA, January 22-24, 1985, Proceedings . New York, Institute of Electrical and Electronics Engineers, 1985, p. 77-81.

It is pointed out that the Failure Modes and Effects Analysis (FMEA) is one of the most effective design analysis techniques used in reliability engineering. Thus, a properly performed FMEA can be used to support a wide range of analyses and disciplines. However, FMEA is expensive to perform, and it requires the use of one or more highly skilled analysts. In addition, MIL-STD-1629A, representing tabular FMEA documentation, is not organized in a way which would permit the maximum effective use of all analysis results. The present paper is concerned with the Advanced Matrix Technique which provides a solution to several of the major problems with FMEA. The Advanced Matrix Technique was developed as part of a study of automated FMEA techniques. Attention is given to the objectives of the Advanced Matrix Technique, aspects of technical structure, technical phasing, and the Failure Effects and Data Synthesis computer program, which was developed to automate the Advanced Matrix FMEA technique. **MAINTENANCE STRATEGIES FOR AERO ENGINES**

J. K. BLUNDELL (Missouri, University, Columbia) and K. W. BEARD (Trans World Airlines, Kansas City, MO) IN: Annual Reliability and Maintainability Symposium, Philadelphia, PA, January 22-24, 1985, Proceedings . New York, Institute of Electrical and Electronics Engineers, 1985, p. 92-98. refs

In the planned replacement of aero engines, common strategies employ time dependent or block replacement methods. Neither can produce optimal strategies as components tend to be replaced unnecessarily, the beauty of the systems are that they are easy to plan although the number of maintenance actions are often excessive. The paper addresses the development of an opportunistic maintenance strategy for the RB 211 commercial airplane engine which develops planned replacements based on system and component reliabilities and which can interactively determine least cost replacement modes at predetermined inspection intervals. **HARDWARE/SOFTWARE FMEA APPLIED TO AIRPLANE SAFETY**

J. B. J. VAN BAAL (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands) IN: Annual Reliability and Maintainablity Symposium, Philadelphia, PA, January 22-24, 1985, Proceedings . New York, Institute of Electrical and Electronics Engineers, 1985, p. 250-255.

Recent changes in the nature of airplane systems have created the need for a systematical and analytical methodology for system safety assessment. Such a methodology is briefly explained. A try-out on a software controlled digital avionics system is described. Special attention is paid to the analysis of the software components of the system. From this work it is concluded that the same methodology can be applied to both software and hardware. Two conditions that have to be met to perform a successful hardware/software safety assessment are described. Author

**IS THERE LIFE AFTER 10,000 FLIGHT HOURS?**

T. M. EVANS and D. L. MERKORD (LTV Aerospace and Defense Co., Dallas, TX) IN: Annual Reliability and Maintainability Symposium, Philadelphia, PA, January 22-24, 1985, Proceedings . New York, Institute of Electrical and Electronics Engineers, 1985, p. 396-401.

(Contract N00019-80-G-0033; NAVY ORDER 0002)

The possibility of keeping an aircraft in service beyond the predetermined fatigue life limits of its structures is considered, with particular reference to the fleet of A-3 aircraft, which exceeded their wing design fatigue life of 10,000 flight hours. Fatigue test/analysis on an A-3 trainer model is described, including discussions of test requirements, development of the fatigue test loading spectrum, the test setup, and testing procedure. It was found that service life of A-3 fleet aircraft can be extended to 18,000 flight hours and 2000 catapults. The test data verified that theoretical analyses for service life extension are reliable when fatigue-test-derived maintainability items are applied. I.S.

**A MULTIPLE-PARAMETER ALLOCATION PROCESS**

C. E. TUCKER (Lockheed-Georgia Co., Marietta, GA) IN: Annual Reliability and Maintainability Symposium, Philadelphia, PA, January 22-24, 1985, Proceedings . New York, Institute of Electrical and Electronics Engineers, 1985, p. 448-453.

An allocation process has been developed to produce realistic component level requirements on multiple reliability and maintainability (R and M) parameters. The process simultaneously allocates a set of multiple key parametric constraints which are translatable from requirements on parameters such as Weapon System Reliability (WSR), Mean Time Between Removals (MTBR), Maintenance Manhours per Flight Hour (MMH/FH), Mean Manhours to Repair (MMH/R), and Availability. Using component and system total predictions and improvability estimates, the process iteratively selects and allocates incremental improvements to the key parameters and components in need of greatest further improvement to achieve air vehicle or system total requirements, and related parameters are allocated improvements proportional to these. The iterative algorithm, which resembles the method of steepest descent, terminates when all key requirements have been met by the sum total of all incremental improvements selected. A brief example is included which reveals the essential features of the process. Author

**QUANTITATIVE DETERMINATION OF ENGINE WATER INGESTION**

P. PARIKH, M. HERNAN, and V. SAROHIA (California Institute of Technology, Jet Propulsion Laboratory, Pasadena) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs

(Contract NAS7-918; DOT-FA03-81-A-00765)

(AIAA PAPER 86-0307)

This paper describes a novel non-intrusive optical technique for determination of liquid mass flux in a droplet laden airstream. The technique was developed for quantitative determination of engine water ingestion resulting from heavy rain or wheel spray. Independent measurements of the liquid water content (LWC) of the droplet laden aircraft and of the droplet velocities were made at the simulated nacelle inlet plane for the liquid mass flux determination. The liquid water content was measured by illuminating and photographing the droplets contained within a thin slice of the flow field by means of a sheet of light from a pulsed YAG laser. A fluorescent dye introduced in the water greatly improved the droplet image definition. The droplet velocities were determined from double exposed photographs of the moving droplet field. The technique was initially applied to a steady spray generated in a wind tunnel. It was found that although the spray was initially steady, the aerodynamic breakup process was inherently unsteady. This resulted in a wide variation of the instantaneous liquid water content of the droplet laden airstream. The standard deviation of ten separate LWC measurements was 31 percent of the average. However, the liquid mass flux calculated from the average LWC and droplet velocities came within 10 percent of the known water ingestion rate. Author

**FORMATION AND CHARACTERIZATION OF SIMULATED SMALL DROPLET ICING CLOUDS**

R. D. INGEBO (NASA, Lewis Research Center, Cleveland, OH) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 12 p. Previously announced in STAR as N86-14554.

(AIAA PAPER 86-0409)

Two pneumatic two-fluid atomizers operating at high liquid and gas pressures produced water sprays that simulated small droplet clouds for use in studying icing effects on aircraft performance. To measure median volume diameter, MVD or D sub v.5, of small droplet water sprays, a scattered-light scanning instrument was developed. Drop size data agreed fairly well with calculated values at water and nitrogen pressures of 60 and 20 psig, respectively, and at water and nitrogen pressures of 250 and 100 psig, respectively, but not very well at intermediate values of water and nitrogen pressure. MVD data were correlated with D sub O, W sub N, and W sub w, i.e., orifice diameter, nitrogen, and water flowrate, respectively, to give the expression for MVD in microns. Author

**DUAL RECTANGULAR JETS FROM A FLAT PLATE IN A CROSSFLOW**
M. KAVSAOGLU, J. A. SCHETZ, and A. K. JAKUBOWSKI (Virginia Polytechnic Institute and State University, Blacksburg) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 13 p. NASA-supported research. refs
(AIAA PAPER 86-0477)

Wind tunnel tests were carried out in order to study the single and dual rectangular crossflow jets injected from a flat plate perpendicular to a free stream. The length-to-width ratio of the jets was 3.97, and the spacing between the center lines was 4.7 times the width of a single jet. Surface pressure distributions were obtained for jet-to-freestream velocity ratios of 2.2 and 4, respectively. The following conclusions are offered on the basis of the experimental results: (1) the downstream extension of the negative pressures is extended to the dual jets in comparison to the single jet; (2) by increasing the jet-to-freestream velocity ratio the downstream extension of negative pressures is reduced, but negative upstream pressures become larger; (3) very high peak negative pressures occur at the front side edges of the rectangular jets compared to round jets. Velocity vector plots in the flowfield of the dual jets are given. I.H.

The use of digital image processing techniques in analyzing and evaluating aerodynamic data is discussed. An image processing system that converts images derived from digital data or from transparent film into black and white, full color, or false color pictures is described. Applications to black and white images of a model wing with a NACA 64-210 section in simulated rain and to computed low properties for transonic flow past a NACA 0012 airfoil are presented. Image processing techniques are used to visualize the variations of water film thicknesses on the wing model and to illustrate the contours of computed Mach numbers for the flow past the NACA 0012 airfoil. Since the computed data for the NACA 0012 airfoil are available only at discrete spatial locations, an interpolation method is used to provide values of the Mach number over the entire field. Author

A typical section model is used to analytically investigate the effect of mass balancing as applied to hollow, supersonic fan blades. A procedure to determine the best configuration of an internal balancing mass to provide flutter alleviation is developed. This procedure is applied to a typical supersonic shroudless fan blade which is unstable in both the solid configuration and when it is hollow with no balancing mass. The addition of an optimized balancing mass is shown to stabilize the blade at the design condition. Author

At the 45th shock and vibration symposium, which was held at the Dayton Convention Center in 1974, the S&V community was alerted to problems that existed in avionics reliability. A two year study described problems and some proposed fixes. The Air Force programs investigated many actions which are still in progress. The progress that has been made toward the solutions that were proffered at the 1974 meeting are reviewed and some of the tasks that still need development are listed. The problems that were disclosed in 1974 fell into both the technical and the administrative arenas. The latter will be mentioned where lack of action interferes with technical progress, the primary topic. Author

**A DIFFERENT APPROACH TO DESIGNED IN PASSIVE DAMPING**

M. L. DRAKE *In* Shock and Vibration Information Center The Shock and Vibration Bulletin 55, Part 1 p 109-117 Jun. 1985 refs

Avail: SVIC, Code 5804, Naval Research Lab., Washington, D.C. 20375 CSCL 20K

In the past, most damping applications were additive designs used to solve field problems. Today, designers are beginning to consider integral (designed in) damping systems. This change in emphasis in damping design will change the market in damping materials. Soon the damping material vendor will be supplying damping materials in bulk form (sheets, rolls, uncured gum) to the structural system manufacturers. Since the damping materials will be required in bulk form, the possibility of ordering a custom formulated material exists. A method is demonstrated which

develops the required damping material properties, discuss formulation changes usable to adjust the damping material properties, and discuss the benefits of such design procedures.

**TRIAXIAL VIBRATION SYSTEM**
W. D. EVERETT and T. H. HELFRICH *In* Shock and Vibration Information Center The Shock and Vibration Bulletin 55, Part 2 p 1-15 Jun. 1985 refs
Avail: SVIC, Code 5804, Naval Research Lab., Washington, D.C. 20375 CSCL 20K

During the reliability tests of external stores the Pacific Missile Test Center has been successful in reproducing the in-service vibration experienced by the store when carried on a high performance jet aircraft. A combination of acoustic and mechanical excitation provides the appropriate vibration magnitude and spectrum. One of the advantages of using acoustic energy has been the simulation of the vibrational state simultaneously in three axes. In attempting to increase test capability to include stores carried on helicopters and other low speed platforms and to maintain a triaxial vibration capability, Pacific Missile Test Center is developing a test facility that will test a 500 pound store in the 0 to 500 Hertz frequency range with a stroke of 2 inches double amplitude. A review of existing low frequency triaxial vibration equipment was conducted, a preliminary design was completed, and individual component and initial developmental model tests were concluded. A description of the device, an overview of the effort to date, an analytical investigation of the motion, and an evaluation test plant was developed for a thorough evaluation of the device are discussed.

**FATIGUE TESTING OF TUBE TO NODE BUTT WELDS ENVISAGED FOR RAE BEDFORD FLIGHT SIMULATOR**
T. D. ROSENBERG Apr. 1985 30 p refs Prepared for Vickers PLC, Hampshire, England
(REPT-23480/2/85; BR95858) Avail: NTIS HC A03/MF A01

Fatigue tests were carried out on tube to node butt welds under axial loads. Results indicate that the joints can be treated as Class F in the BS 5400 fatigue design rules for welded joints. Pressure drop and leak detection systems for crack detection during the operation of the structure were evaluated. The pressure drop system is found to be effective in detecting the presence of through-thickness cracking. The reserve static strength of a joint containing a single through-thickness crack was measured, and found to be equivalent to a nominal stress in excess of the yield strength of the parent material.

**THE ROLE OF COMPUTATIONAL FLUID DYNAMICS IN AERONAUTICAL ENGINEERING**
T. UCHIDA, T. JYONOUCHI, K. SAWADA, and T. NOHISA *In* National Aerospace Lab. Proceedings of the 2nd NAL Symposium on Aircraft Computational Aerodynamics p 255-270 1984 refs In JAPANESE; ENGLISH summary
(REPT-2) Avail: NTIS HC A14/MF A01

The task of aircraft design often favors a robust, low-cost computational method rather than a sophisticated one. Examples of such engineering methods currently in use are described in this paper. Included are a viscous-inviscid coupling procedure for a 2-D airfoil at high angle of attack in incompressible flow, a vortex-lattice procedure for not-so-slender wings, and extensions of the FLO22 code so as to incorporate the fuselage- and fluid-viscosity effects.

Aerodynamics, flight, structures and materials, space technology and remote sensing, informatics, environment, energy supply, and equipment, were studied. Research for the Fokker-50 and 100 projects and related development of a measuring, recording, and data processing system for aircraft are described. Damage tolerance of aircraft structures and materials such as carbon/epoxy laminates with outer plies of glass, Aramid and carbon fabric, titanium alloys, and carbon fiber composites, were investigated. Fluid physics research, spacecraft attitude control system tests, and thermal vacuum research were carried out. The development of a multispectral CCD scanner, synthetic aperture radar, and side-looking airborne radar, were studied. A program to integrate aerospace informatics disciplines is described. Air traffic noise calculations, and windpower utilization research were executed. A simulation system for the satellite navigation system NAVSAT was developed. A low-speed wind tunnel LST 3x2.25 was commissioned.

**ESTABLISHMENT AND USE OF TIME UNIFICATION SYSTEM FOR CIVIL AVIATION**
M. M. MALYY *In its* USSR Report: Electronics and Electrical Engineering (JPRS-UEE-84-016) p 30 30 Nov. 1984 Transl. into ENGLISH from Izmeritelnaya Tekhnika (Moscow, USSR), no. 5, May 1984 p 28-30
Avail: NTIS HC A03/MF A01

Precise and fail proof operation of the various services used by civil aviation throughout the territory of the USSR depends largely on synchronization, the latter requiring periodic indication of time scales and involving the concept of time unification. The principal users of a time unification system are the traffic control service and the flight crew. Since 1974 electromechanical hand-and-dial clocks in airports have been gradually replaced with modern signal clocks. Installation of secondary clocks in control towers, time encoding in the secondary clocks, and interfacing the clock room with the computer of the appropriate automatic control system are improvements made in the control tower. Time indicating and time keeping equipment is also installed in airplanes for tie-in with airports by means of radio signals over metric wave or decametric-wave communication channels. The necessary short range radio navigation system with the inclusion of satellites for transmittal of unified time information from airports to airplanes and equipment characterized by satisfactory technical accuracy and high stability with means for automatic or semiautomatic time correction guaranteeing high reliability for a period of 10 years is produced. **HOT GAS LABORATORY TWIN NOZZLE CALIBRATION**
A. P. WINSTANLEY 1 Jul. 1985 37 p refs
(BAE-ARG-200) Avail: NTIS HC A03/MF A01

The quality of a twin nozzle flow is investigated. The assembly was manufactured to produce high temperature jet related data relevant to VSTOL aircraft when adapted to a wind tunnel hot gas facility. The twin nozzles are of an Ni-resistant flake cast iron construction whereas the standard 120 mm diameter single nozzle is a stainless steel, water-cooled fabrication. A calibration rake was used to acquire pressure and temperature data over an array of data points. The tests show that the construction method is satisfactory. The total pressure quality in the exit plane is good. A negative temperature gradient is found along the y axis. The nozzle reference pressure is a good indication of the average total pressure in the exit plane. Author (ESA)

**BOUNDARY LAYER CALCULATIONS ON THE LEEWARD SURFACE OF A SLENDER DELTA WING AT INCIDENCE**
A. C. DEBRUIN 22 Dec. 1983 41 p refs
(NLR-TR-84001-U; B8569025) Avail: NTIS HC A03/MF A01

A 3D-boundary layer calculation method was used to predict the location of the secondary boundary layer separation on the leeward surface of a slender delta wing at incidence for fully laminar flow and forced boundary layer transition at the 50% semispan location. The behavior of the predicted boundary layer properties is qualitatively in good agreement with the experiment. A difference between the potential flow and experimental pressure distribution causes a discrepancy between the predicted and the experimentally observed location of secondary separation. It is expected that the potential flow pressure distribution can be improved when the leading edge and the secondary separation vortex sheet are correctly modeled in the potential flow calculation method. It is concluded that boundary layer calculations can provide valuable information for the location of the secondary separation line, to model the associated vortex sheet. Author (ESA)

**QUADRINOMIAL DISTRIBUTION FOR THE CHARACTERIZATION OF NONDESTRUCTIVE INSPECTION (NDI) RELIABILITY**
J. H. HEIDA 27 Jun. 1984 17 p refs Presented at 3rd European Conference on Nondestructive Testing, Florence, Italy, 15-18 Oct. 1984
(NLR-MP-84064-U; B8568524) Avail: NTIS HC A02/MF A01

Inclusion of probability of detection (POD) and probability of recognition (POR) of flaws in characterization of nondestructive inspection (NDI) reliability is considered. Possible measures for this characterization are discussed using inspection results of a test specimen population of 200 identical 4340 steel aircraft landing gear components rejected from service because of crack indications or exceedance of the safe service life. It is concluded that it is doubtful whether the discussed parameters give an appropriate measure of NDI reliability; it is recommended to establish minimum values for the POD and POR at a specified confidence level. **DESIGN OF HAT-STIFFENED COMPOSITE PANELS UNDER UNIAXIAL COMPRESSION AND SHEAR. MINIMUM MASS OPTIMIZATION BASED ON A SIMPLIFIED THEORY**

G. ROMEO (Polytecnico di Torino, Italy) 1984 46 p refs
Sponsored by Technical Hogeschool, Delft
(VTH-LR-312) Avail: NTIS HC A03/MF A01

Literature on stiffened compression panels was reviewed, and a computer program for the evaluation of minimum-mass hat stiffened panels under uniaxial loads was written. In the analytical studies the mechanical properties of the graphite/epoxy material were considered to be linearly elastic and the lower stresses Young's modulus was used. Since a reduction of up to 20% is possible in compression, the 50% mass-saving derived from these results seems too optimistic. A reduced stress-dependent Young's modulus should be used and the tangent modulus theory applied. Better mass-savings are possible with higher hat height values, but these depend on wing airfoil thickness since the optimal distance from the bending neutral axis is required. Under uniaxial compression, a mass-saving up to 40% compared with test data on aluminum panels is evaluated. The fabrication process did not require complex tooling or a difficult production technique. However, complexity could arise for a correct nondestructive inspection of all parts of the panel, because of the closed stiffeners with inclined surfaces. Author (ESA)

**FATIGUE RATED FASTENER SYSTEMS IN ALUMINUM ALLOY STRUCTURAL JOINTS**

H. H. VANDERLINDEN 14 Jul. 1983 29 p refs Presented at 12th ICAF Symposium, Toulouse, France, 25-27 May 1983
Sponsored by Royal Netherlands Air Force Directorate of Material
(Contract NIVR-1892)
(NLR-MP-83045-U; B8569323) Avail: NTIS HC A03/MF A01

A fatigue rated fastener systems test program for aircraft is described. The program assesses fatigue lives of fastener systems in combination with hole preparation techniques using different joint geometries. Establishment of cost figures in relation to the fatigue performance and the development of a reference datum for the comparison of test results produced in different countries are included. For high load transfer single shear joints, joint designs and their double shear equivalent designs are compared. Evaluation includes testing under FALSTAFF loading and the measurement of load transfer and secondary bending using standard procedures. Fatigue test results of low load transfer, medium load transfer 1 1/2 dogbone, and high load transfer double shear specimens are also included. Procedures for measuring load transfer and secondary bending are illustrated using 1 1/2 dogbone specimens. Author (ESA)

**AN EXTREME CLEAR AIR TURBULENCE INCIDENCE ASSOCIATED WITH A STRONG DOWNSLOPE WINDSTORM**

P. F. LESTER (San Jose State University, CA) and R. E. BACH, JR. (NASA, Ames Research Center, Moffett Field, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 8 p. refs
(AIAA PAPER 86-0329)

The meteorological conditions present during an occurrence of clear-air turbulence (CAT) associated with the presence of a mountain wave are documented. The incident caused severe vertical accelerations of two passenger aircraft travelling at 33,000 ft altitude. Satellite, pilot report and surface and upper air meteorological data were examined to characterize the situation. The CAT was apparently produced by an unusually strong westerly flow over the Rocky Mountains, causing a lee wave over the foothill regions where the turbulence was experienced. A downslope windstorm formed at the same time as wave activity on three scales: 60 nm, 17 nm and 1 nm in the troposphere. The data suggest that surface observations of severe windstorms in the mountain foothill regions could be used to predict the presence of CAT conditions, especially if combined with available data on lee waves. **ANALYSIS AND CONCLUSIONS OF THE WORKING GROUP FOR SENSITIVITY ANALYSIS AND ZONING CALCULATIONS (GAZOB) Final Report**

*In its* Report of the Working Group for Sensitivity Analysis and Zoning Calculations (GAZOB) 42 p May 1985 In DUTCH
Avail: NTIS HC A05/MF A01

The sensitivity of noise pollution calculations to the input data system was analyzed in the area of Schiphol airport with a consideration for housing construction plans, based on the present runway system for the situation expected around 1990 and later. The analysis allows a better insight into the variation of factors which contributes to noise pollution calculations. The only free parameters for the choice of a zone contour are shown to be the fleet composition and the number of aircraft movements. The possible conditions in 1995 and 2000 are calculated and show a substantial noise reduction the planned improvements. It is concluded that a regional zoning for home construction based on the contours calculated for 1990 is justified. Author (ESA)

**AFOS (AUTOMATION OF FIELD OPERATIONS AND SERVICES) MONITORY OF TERMINAL FORECASTS**

D. J. VERCELLI and G. A. NORMAN May 1985 33 p
(PB85-236388; NOAA-NWS-TDL-CP-85-1) Avail: NTIS HC A03/MF A01 CSCL 04B

Aviation terminal forecasts (FT's) are issued three or four times per day, depending on location, for selected terminals within the area of responsibility of a Weather Service Forecast Office (WSFO). The FT's contain specific meteorological information on cloud heights and amount, visibility, weather, obstructions to vision, and wind. This information is considered to be the most important to aviation interest in and near the terminal area. A FORmula TRANslation (FORTRAN) program, described by this document, will assist the forecaster with this time-consuming weather-watch function by comparing the information in the FT's with the corresponding information on the surface airways observations. The FT monitoring program, called MONITR makes use of two sets of criteria to determine whether or not a problem exists with a particular FT. In both the amendment and alert cases, the forecaster still has the final responsibility to decide whether or not the FT should be amended. GRA

**CERR: AN AVIATION VERIFICATION PROGRAM**

M. R. PEROUTKA Apr. 1985 28 p
(PB85-204824; NOAA-NWS-ERCP-30) Avail: NTIS HC A03/MF A01 CSCL 04B

Aviation verification statistics have been computed for Cleveland forecasters since 1980. For most of these years, the computations were done by hand, and a simple statistic had to be developed. The CERR program was developed soon after the National Verification Programs began to run, and it has replaced all the manual computations. The statistic chosen for verification was the average MOS category error. This statistic is simply the absolute value of the difference between the category forecast and the category observed. Scores are computed for each forecaster and guidance at each station for each period forecast. The percent improvement over guidance is also computed. GRA

**NOISE ASSESSMENT AROUND SCHIPHOL AIRPORT (THE NETHERLANDS) IN 1981 [DE GELUIDSBELASTING ROND SCHIPHOL IN 1981]**

J. F. W. BAARSLAG 4 May 1982 24 p refs In DUTCH
(Contract RB-RLD-82-4.1)
(NLR-TR-82034-U) Avail: NTIS HC A02/MF A01

Aircraft noise assessment calculations around an airport are presented. Airport and surroundings are projected on a flat reference surface, on which a 100 m mesh network of points is superimposed. Minimum distances between flight paths and points, maximum noise levels of aircraft per category, and lateral correction factors are determined. Using these data, the number of flight motions, and night penalty factors of aircraft per category, the noise assessment is calculated in cost units with a logarithmic aircraft noise pollution formula. Interpolating between points of equal assessment, noise assessment contours, and areas within are mapped. Author (ESA)

**COMPUTER TOOLS AND TECHNIQUES FOR ANALYSIS OF DISCRETE DATA FROM AIRCREW AUTOMATED ESCAPE SYSTEMS (AAES)**

J. D. FRITSVOLD and J. E. VETTER (U.S. Navy, Analytical Systems Div., Washington, DC) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 37-40. refs

Analyses have been conducted for automated aircrew escape systems, using statistical models generated in part by computer tools to study the significant factors that contribute to problems during ejections or emergency escapes. Extensive use is made in this work of discrete variables that are presented in a frequency table of cross classifications. Significant associations are thereby established, while spurious ones are rejected. The computational capability in question allows the study of the effects of several factors simultaneously on a variable of interest, such as the likelihood of a severe injury or fatality during an aviation emergency. O.C.

### HOW MUCH INHERENT BUOYANCY IS ACCEPTABLE IN A HELICOPTER PASSENGER IMMERSION SUIT

C. J. BROOKS and J. D. M. PROVENCHER IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 75, 76. refs

The buoyancy value of helicopter crewmembers' immersion suits (for hypothermia protection) may be so high as to actually prevent escape from an immersed helicopter's inverted cabin. A recent evaluation of quick-down immersion suits noted a wide range of inherent buoyancies. Attention is presently given to the tradeoffs between inherent buoyancy, hypothermia protection, and underwater escape capability. A 20-lb inherent buoyancy figure is recommended. O.C.

**A86-19329**

### LIMB RESTRAINT EVALUATOR (LRE)

T. GUSTIN (Systems Research Laboratories, Inc., Dayton, OH) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 183-187. USAF-supported research.

The present paper provides a description of a state-of-art data acquisition and recording system which is part of an advanced ejection system test manikin developed by an American company. The manikin is the Limb Restraint Evaluator (LRE), which was designed to test restraint devices to be incorporated into modern aircraft ejection equipment by the U.S. Air Force. The design goals of the LRE are considered, taking into account the successful sensing and capturing of data for 96 phenomena sources for a free-flight test article for the ACES II restraint tests. Difficulties related to the extremely large number of data channels were overcome by employing a Pulse Code Modulation (PCM) type system (time multiplexed). Attention is also given to the use of a low pass filter, a challenge related to telemetry dropout, the selection of onboard storage technique, and the CPU. G.R.

ILMARINEN (Institute of Occupational Health, Helsinki, Finland) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 204-207. Research supported by Statoil. refs

Several survival suits have been tested regarding water leakage in the suit during evacuation from a sinking and turned helicopter, total buoyancy for a person dressed in a suit, and the suits insulating properties after evacuation from the helicopter. Water content in the suit followed an evacuation with partly open zippers would be in order of 9-18 kg. Closed-off air in the suit could give some suits a buoyancy in a turned helicopter as high as 40-50 kg. Water leakage into the suits, which is likely to occur, would change the thermal insulation properties of the suits. Even smaller water ingress would have considerably effect on body cooling, while water ingress in a magnitude as established for the evacuation situation result in a very rapid drop in core temperature of the subject (2.0-2.5 C/hour). ### PROTECTIVE RESPIRATOR FOR THE AAH-64 ADVANCED ATTACK HELICOPTER

D. M. ENGLISH (U.S. Army, Chemical Research and Development Center, Aberdeen Proving Ground, MD) and L. DICKERSON (ILC Industries, Inc., Frederica, DE) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 223-226. Army-supported research.

The present paper is concerned with the background and development philosophy utilized in designing and fabricating a protecting mask system for the U.S. Army AH-64 Attack Helicopter. The very sophisticated weapons and flight systems employed by this helicopter require close optical coupling to various devices. For this reason, current protective masks cannot be used effectively. The U.S. Army issued, therefore, a contract for the development of a protective mask which would interface with the AH-64 Integrated Helmet and Display Sighting System (IHADSS). Attention is given to a description of the AH-64 helicopter, the operational capabilities of the AH-64, mask system requirements, a mask system description, a blower system description, and a program overview. An accelerated development of the IHADSS mask system will allow the U.S. Army to field the AH-64 helicopter on schedule. G.R.

### PILOT UNDERWATER HIGH PRESSURE EMERGENCY BREATHING SYSTEM

M. RATAJCZAK (Moog, Inc., East Aurora, NY) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 259-262.

The High Pressure Emergency Breathing System (HPEBS) has the objective to provide life support for an aircrewman in the event of a parachute landing over water. A water activated switch closes the antisuffocation valve in the breathing system, and the HPEBS is actuated. A utilization of the HPEBS increases survival possibilities for an aircrewman in a high sea state. The HPEBS is to provide 500 standard liters of air for consumption. The air is stored in a high pressure spherical vessel. A pyrotechnic actuator and a pressure reducer is also provided. Attention is given to details of pressure vessel design, the pyrotechnic squib, aspects of pressure reducer design, and acceptance level test results. G.R.

### LABORATORY AND FLIGHT TESTING OF BALLISTIC PROTECTIVE HEADGEAR FOR ROTARY WING AIRCREW

D. S. MCCAULEY (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 263-268. refs

The results of laboratory and flight tests on two types of ballistic protective gear developed for helicopter aircrew that can be exposed to small arms fire and fragments are reported. The type 1 system is a complete ballistic protective helmet assembly, while the type 2 system consists of a ballistic clip-on unit which can be quickly added to a lightweight, form-fitting helmet. Both systems were shown to meet the ballistic requirements, when tested in accordance with standard requirements of an average ballistic limit, V50, of 1150 ft/s for a 17 grain, 0.22 caliber, type 2 fragment-simulating projectile, and demonstrated good impact resistance. Although most subjects in the flight tests preferred the clip-on system because of weight considerations, the ANVIS ready helmets available to almost all battlefield aircrew are not compatible with a ballistic clip-on bonnet. Therefore, further development of the type 1 system only is recommended. I.S.

### THE STATE OF THE ART OF ANTHROPOMORPHIC MANIKINS AND REQUIREMENTS FOR THE EVALUATION OF ADVANCED AIRCRAFT EJECTION SYSTEMS

J. A. TIEBER (Systems Research Laboratories, Inc., Dayton, OH) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 269-275.

A study was conducted to define the capabilities of existing anthropomorphic manikins and the capabilities required of modern manikins to be suitable for the evalution of advanced aircraft escape systems. Specifications for an advanced ejection system test manikin, which resemble and act like a human body when subjected to aerodynamic and inertial loadings associated with aircraft escape conditions, include the simulation of human response to force loadings at various body components, anthropometric accuracy, mass and inertial properties of various body segments, joint articulation, and structural strength. Data acquisition considerations include the type and placement of sensors, number of data channels, data processing and formatting, and on-board storage and/or telemetry requirements. The standard packaging, placement, and environmental protection factors also must be considered. The development of a family of manikins, consisting of an average member and two members representing the fifth and 95th percentiles of the anthropometric spectrum, is recommended. I.S.

### EVALUATION OF PILOT PERFORMANCE AND AIRCREW PROTECTIVE DEVICES IN A SIMULATED F-14 FLAT SPIN ENVIRONMENT

J. EYTH, JR. and D. P. GLEISNER (U.S. Naval Material Command, Naval Air Development Center, Warminster, PA) IN: SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings . Van Nuys, CA, SAFE Association, 1985, p. 350-355. refs

A pilot's response to a simulated F-14 flat spin is studied. The F-14 aerodynamic model and the human centrifuge motion platform of the Dynamic Flight Simulator are examined. A spin recovery test is performed to evaluate a pilot's ability to recover the aircraft from the spin and determine what factors influence an unsuccessful recovery. The spin warning display system and restraint system evaluated in the spin test are described. Graphs are provided on the number of revolutions, altitude loss, and recovery time as a function of spin entry condition. The results reveal that higher yaw rates cause an increase in the numbar of revolution, greater altitude loss prior to recovery of the aircraft, and the pilots are not incapacitated by the high -Gx forces. The spin warning display and restraint systems are highly rated by the pilots. I.F.

### USAF TOXICOLOGY RESEARCH ON PETROLEUM AND SHALE-DERIVED AVIATION GAS TURBINE FUELS

J. A. MARTONE (USAF, Aerospace Medical Research Laboratory, Wright-Patterson AFB, OH) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 4 p. refs

(Contract F33615-80-C-0512)

(ASME PAPER 85-GT-34)

The effect of exposure to the hydrocarbons of aircraft turbine fuels on man is examined. Methods used to establish chemical exposure limits, which include the Threshold Limit Value-Time-Weighted Average (TVL-TWA), TVL-Short-term Exposure Limit (TVL-STEL), and skin notation, are described. The proposed limits for JP-4 are a TLV of 700 mg/cu m, a STEL of 1050 mg/cu m, and n-hexane as a skin notation. Experiments are conducted in which rats are exposed to 2500 and 5000 mg/cu m of JP-4 for 8 months, and 500 and 100 mg/cu m for 90 days. The 8-month data reveal no effect on the rats by the fuel is detected; however, in the 90-day test group reduced weight gain, the formation of hyaline droplets in the proximal tubular epithelium, increased kidney/body weight ratios, and renal carcenoma are observed. The mechanism which causes this hydrocarbon-induced renal effect and its possible influence on man are being investigated. I.F.

### A NEW APPLICATION OF ADAPTIVE NOISE CANCELLATION

W. A. HARRISON (Sanders Associates, Inc., Nashua, NH), J. S. LIM (MIT, Cambridge, MA), and E. SINGER (MIT, Lexington, MA) IEEE Transactions on Acoustics, Speech, and Signal Processing (ISSN 0096-3518), vol. ASSP-34, Feb. 1986, p. 21-27. Research sponsored by Sanders Associates, Inc. refs

(Contract NR PROJECT 049-506; N00014-81-K-0742; F19628-85-K-0028; NSF ECS-80-07102)

Widrow et al's (1975) adaptive noise cancellation (ANC) method is applied to the case where an acoustic barrier exists between the primary and reference microphones. ANC, by updating the coefficients of the noise estimation filter only during silence, can furnish substantial noise reduction with little speech distortion even when the acoustic barrier provides only moderate attenuation of acoustic signals. An evaluation is made of a modification of ANC for the oxygen facemasks worn by fighter pilots; if a noise field is created using a single source, an 11-dB SNR improvement is achieved by attaching a reference microphone to mask's exterior. O.C.

### UPSILON INVARIANTS - A UNIFORM SET OF MOMENT INVARIANTS

V. N. DVORNYCHENKO (Northrop Corp., Electro-Mechanical Div., Anaheim, CA) IN: Applications of digital image processing VII; Proceedings of the Meeting, San Diego, CA, August 21-24, 1984 . Bellingham, WA, SPIE - The International Society for Optical Engineering, 1984, p. 40-46. refs

A set of uniform magnitude, minimal-order moment invariants is introduced. The relationship to the Hu and other invariants is explained. It is shown how the present invariants circumvent some of the more serious limitations of the Hu set. For example, it is shown that the Hu invariants are algebraically dependent and how this arises. Graphic representations in the form of hidden-line surfaces in feature space are presented. A proposed basis for 'aspect-independents' is outlined. Author

### CONTROL METHODOLOGY FOR STOCHASTIC SYSTEM CHARACTERISTICS MODULATION

M. N. WAGDI (Suez Canal University, Port Fouad, Egyt) and A. A. ABDEL KADER (Arab Organization for Industrialization, Cairo, Egypt) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 10 p. refs

(AIAA PAPER 86-0335)

A new control methodology for modulation of stochastic system characteristics is presented. Two realistic concepts are introduced. The stochastic behavior of each individual system parameter is considered. This is done by superposing a stochastic part through a small perturbation factor to the nominal deterministic part for each system parameter. The other realistic concept is that of considering the combined dynamics of both plant and actuators. A direct relation between the control gain matrix and the closed loop eigenvalues is derived. A criterion is obtained to insure the control system robustness. The present methodology is applied to the design of a lateral controller for a typical high performance fighter aircraft. Author

**THE ADAPTIVE MANEUVERING LOGIC PROGRAM IN SUPPORT OF THE PILOT'S ASSOCIATE PROGRAM - A HEURISTIC APPROACH TO MISSILE EVASION**

G. H. BURGIN, W. H. WILLIAMS, and L. B. SIDOR (Titan Systems, Inc., San Diego, CA) AIAA, Aerospace Sciences Meeting, 24th, Reno, NV, Jan. 6-9, 1986. 9 p. refs

(AIAA PAPER 86-0423)

A real time man-in-the-loop missile evasion simulation is conducted for a fighter aircraft, using a pilot's associate program designated 'Adaptive Maneuvering Logic' (AML) to determine suitable maneuvers on the basis of a set of production rules. In one of the two operating modes of the AML, maneuvering cues are displayed on the pilot's HUD. In the second mode, the AML-generated maneuver commands are fed directly into the flight control system. An illustrative two-missile evasion is presented. O.C.

**UNDERSTANDING NATURAL LANGUAGE COMMANDS**

H. H. CHIN (Grumman Aerospace Corp., Bethpage, NY) IN: Spatial information technologies for remote sensing today and tomorrow; Proceedings of the Ninth Pecora Symposium, Sioux Falls, SD, October 2-4, 1984 . Silver Spring, MD, Institute of Electrical and Electronics Engineers, Inc., 1984, p. 106-119. refs

A tunable frame-grammar currently being developed for a Natural Language Control parser is described. How attributes to words and phrases are fitted in the frame structure, and how a pragmatic component helps the parser to choose among competing sentential actions in order to interpret commands correctly, are shown. A pragmatic component which describes the sensibility of a command text in the understanding process is developed. One set of pragmatic rules is used to check the temporal and spatial reasoning of actions, and another set is used to check the state and cause reasoning about goals. Two kinds of ambiguity in the pragmatics are explored in detail. C.D.

**MULTI-KNOT BOOLEAN SUM INTERPOLATING SURFACE INTERACTIVE DESIGN OF AIRCRAFT CONFIGURATION**

M. GAO Northwestern Polytechnical University, Journal, vol. 3, Oct. 1985, p. 487-498. In Chinese, with abstract in English. refs

A new kind of modelling tool, a multiknot-based Boolean sum surface, is proposed. Using different Boolean sum operators, more than thirty surface schemes are derived, and the programs of the surfaces are developed for the interactive design of aircraft configuration with computer graphics. The surface interpolating methods are applied to define components of two types of aircraft under development. It is found that they can save as much as 40 percent CPU time compared with B-spline fitting surface. The interactive adjustment of knot parameters is predictable and simple. C.D.

**RECURSIVE INSTRUMENTAL VARIABLE ALGORITHMS FOR MODAL PARAMETER ESTIMATION OF STRUCTURAL SYSTEM**

Z. LI, X. LIU, and Y. ZHU Northwestern Polytechnical University, Journal, vol. 3, Oct. 1985, p. 505-514. In Chinese, with abstract in English. refs

In this paper, the Autoregressive Moving Average Exogenous Variables model is constructed for a structural system, and identification techniques called Recursive Instrumental Variable (RIV) methods are used to estimate modal parameters. The methods have good asymptotic properties and are computationally more efficient. They are accurate in the presence of correlated noise and constitute an adaptive processing technique when the noise statistics are not known a priori. A DDF-RIV method which applies RIV techniques to direct decimated data is proposed as a method which efficiently improves the resolution. The performance of the algorithm is illustrated with simulation results, and a vibration test of a one-quarter scale model of a cantilever aircraft wing is used to show the availability of the method. A comparison is made between different RIV, recursive least squares, and frequency domain methods, the results showing that RIV and DDF-RIV methods have some advantages for modal parameter estimation in certain cases. C.D.

**SUPPORT EFFECTIVENESS EVALUATION MODEL**

N. N. CHANG and J. E. HOWARD (Northrop Corp., Hawthorne, CA) IN: Annual Reliability and Maintainability Symposium, Philadelphia, PA, January 22-24, 1985, Proceedings . New York, Institute of Electrical and Electronics Engineers, 1985, p. 322-328.

The present paper provides the description of a model which was designed to evaluate operating and support alternatives in conjunction with the reliability and maintainability characteristics of fighter aircraft operating in the West European Theater. The model is generic in the sense that neither a prescribed air base structure nor a specific type of aircraft is implied. It is the model's objective to evaluate alternate air-base structure according to the criteria of sortie generation, effectiveness, and resource consumption. Both destruction and creation of new operating locations are simulated. Attention is given to hardware and information flows, the operating location data base, a repair capability sensitivity analysis, and model resource requirements. G.R.

Avail: NTIS HC A02/MF A01 Palo Alto, Calif.) CSCL 09B

Two of the main issues in artificial intelligence today are knowledge acquisition dion and knowledge representation. The Dryden Flight Research Facility of NASA's Ames Research Center is presently involved in the design and implementation of an expert system flight status monitor that will provide expertise and knowledge to aid the flight systems engineer in monitoring today's advanced high-performance aircraft. The flight status monitor can be divided into two sections: the expert system itself and the knowledge acquisition tool. The knowledge acquisition tool, the means it uses to extract knowledge from the domain expert, and how that knowledge is represented for computer use is discussed. An actual aircraft system has been codified by this tool with great success. Future real-time use of the expert system has been facilitated by using the knowledge acquisition tool to easily generate a logically consistent and complete knowledge base. Author

**A SIMULATION OF ROTOR-STATOR INTERACTION USING THE EULER EQUATIONS AND PATCHED GRIDS**
M. M. RAI (Informatics General Corp.) Dec. 1985 10 p refs
(NASA-TM-86821; A-85376; NAS 1.15:86821) Avail: NTIS HC A02/MF A01 CSCL 12A

An unsteady Euler code to study rotor-stator interaction problem was developed. The code uses patched grids that move relative to each other to simulate the motion of the rotor airfoils with respect to the stator airfoils. The Osher integration scheme is used in conjunction with an implicit relaxation approach. The scheme is second order accurate in space and time, and is also TVD in each spatial direction. The numerical results were found to be periodic in time, thus demonstrating the capability of the integration and zonal schemes in simulating periodic time dependent flow. The pressure contours obtained are almost oscillation free because of the TVD nature of the scheme. A new procedure was developed to simulate flows about bodies that move relative to each other. This capability should prove to be very useful in the areas of rotor-stator interaction, propeller-nacelle interaction, and helicopter rotor-fuselage interaction. Author

**MARKOV JUMP-DIFFUSSION MODELS AND DECISION-MAKING FREE FILTERING**
H. A. P. BLOM 24 Oct. 1983 22 p refs Presented at 6th International Conference on Analysis and Optimization of Systems, Nice, France, 19-22 Jun. 1984
(NLR-MP-83067-U; B8566529) Avail: NTIS HC A02/MF A01

Nonlinear filtering of Gaussian observations of a Markov jump-diffusion with an embedded Markov chain, that is described by Poisson measure is considered. The modeling potential of this class of Markov processes is illustrated by simple realistic examples. For the evolution of the conditional expectation of the Markov process, decomposed representations are given. They are used as a basis to obtain approximate filtering algorithms free of decision making mechanisms. The algorithms are discussed for the examples given. Author (ESA)

**AN EFFICIENT FILTER FOR ABRUPTLY CHANGING SYSTEMS**
H. A. P. BLOM 25 Jul. 1984 7 p refs Presented at 23rd IEEE Conference on Decision and Control, Las Vegas, Nev., 12-14 Dec. 1984
(NLR-MP-84071-U; B8568106) Avail: NTIS HC A02/MF A01

For a linear discrete time system with coefficients that are governed by an N-state Markov chain, e.g., an aircraft tracked by surveillance radar, a filtering algorithm is defined. It consists of a bank of N interacting Kalman-like filters which communicate with a filter for the Markov chain. When the transition probabilities of the Markov chain are zero, the interacting multiple model (IMM) algorithm reduces to the MM algorithm. Qualitative comparisons with the best other algorithms show an improvement of the ratio between performance and computational complexity up to a factor N. The performance of the IMM algorithm reaches, for small time lags, that of an N times more complex generalized pseudo Bayes algorithm. Author (ESA)

(Contract NAS1-16689)
(AIAA PAPER 86-0281)

An experimental study of the flowfield of heated and unheated single and dual jet configurations was performed. This study of two parallel jets is unique since most previous aerodynamic structure experiments were limited to single round and two-dimensional jets. The present closely spaced dual jet geometry was motivated by the potential jet noise reduction available from this configuration. This geometry has shown promise as a method for redirecting jet noise away from ground based observers in side by side or over/under turbofan engine mountings on aircraft (Simonich et al., 1984). Since the effectiveness of this noise reduction technique is based on the existence of two independent jets, an understanding of the aerodynamics of the merging process is essential to establishing the acoustic benefits. The experimental program was structured so that Mach number, jet exit temperature, and spacing to diameter ratios could be independently varied to isolate each effect. Author

(Contract NSG-3231)

The one dimensional equations of gas dynamics are used to model subsonic acoustic choking. This model can accommodate non-linear distortion of waves and the eventual formation of shock waves. Several finite differencing schemes are adapted to obtain solutions. The results obtained with the various schemes are compared with the asymptotic results available. The results suggest that no one finite differencing scheme gives solutions significantly better than the others and that most of the difference solutions are close to the asymptotic results. If the acoustic shock wave is sufficiently strong it almost annihilates the acoustic wave; in this situation numerical errors may dominate the results. Such solutions involve very large acoustic attenuations. Author

A 2.1-m-diam, one-sixth-scale model helicopter main rotor was tested in hover at the NASA Ames Outdoor Aerodynamic Research Facility. It had previously been tested in hover in the NASA Ames 40- by 80-Foot Wind Tunnel test section. The primary objective of the tests was to obtain acoustic and performance data on a medium-scale rotor at various thrust coefficients and tip Mach numbers to compare to similar existing data on a full-scale helicopter main rotor. Information is presented on the effects of thrust- and tip-speed variation, the effects of boundary-layer trip strips, and the effects of wind conditions. In addition, a preliminary evaluation of the scaling of helicopter main-rotor noise in hover is presented. A secondary objective was to contribute to a data base that will permit the estimation of facility effects on acoustic testing. Author

(NASA-TM-87637; NAS 1.15:87637) Avail: NTIS HC A03/MF A01 CSCL 20A

A laboratory experiment was conducted to compare the flyover noise annoyance of proposed advanced turboprop aircraft with that of conventional turboprop and jet aircraft. The effects of fundamental frequency and tone-to-broadband noise ratio on advanced turboprop annoyance were also examined. A computer synthesis system is used to generate 18 realistic, time varying simulations of propeller aircraft takeoff noise in which the harmonic content is systematically varied to represent the factorial combinations of six fundamental frequencies ranging from 67.5 Hz to 292.5 Hz and three tone-to-broadband noise ratios of 0, 15, and 30 dB. These advanced turboprop simulations along with recordings of five conventional turboprop takeoffs and five conventional jet takeoffs are presented at D-weighted sound pressure levels of 70, 80, and 90 dB to 32 subjects in an anechoic chamber. Analyses of the subjects' annoyance judgments compare the three categories of aircraft and examine the effects of the differences in harmonic content among the advanced turboprop noises. The annoyance prediction ability of various noise measurement procedures and corrections is also examined. Author

(NLR-MP-84049-U; B8568094; ICAS-84-5.8.2) Avail: NTIS HC A02/MF A01

For jet noise reduction the feasibility of a lined ejector nozzle for the Fokker F28 aircraft was investigated by scale model measurements using decomposed hydrogen peroxide for hot jet simulation. Thrust performance measurements were included. For the design of optimum acoustic liners a mathematical model was developed to represent the fan and engine duct acoustically, taking into account the sound generation by rotor wake/stator interaction. Acoustic measurements were performed in the engine inlet of a Fokker F28 aircraft during flight. Techniques and facilities were developed for accurate in-situ measurements of the impedance of acoustic liner materials under realistic conditions. The technique was also demonstrated in-flight. Large reductions of the propeller noise level inside the cabin of the Fokker F27 aircraft were obtained by dynamic vibration absorbers on the fuselage wall structure. Author (ESA)

**SEPARATION OF AIRBORNE AND STRUCTUREBORNE NOISE RADIATED BY PLATES CONSTRUCTED OF CONVENTIONAL AND COMPOSITE MATERIALS WITH APPLICATIONS FOR PREDICTION OF INTERIOR NOISE PATHS IN PROPELLER DRIVEN AIRCRAFT Ph.D. Thesis**
M. C. MCGARY Jan. 1986 313 p refs
(NASA-TM-87414; NAS 1.15:87414) Avail: NTIS HC A14/MF A01 CSCL 20A

The anticipated application of advanced turboprop propulsion systems and use of composite materials in primary structure is expected to increase the interior noise of future aircraft to unacceptability high levels. The absence of technically and economically feasible noise source-path diagnostic tools has been a primer obstacle in the development of efficient noise control treatments for propeller driven aircraft. A new diagnostic method which permits the separation and prediction of the fully coherent airborne and structureborne components of the sound radiated by plates or thin shells has been developed. Analytical and experimental studies of the proposed method were performed on plates constructed of both conventional and composite materials. The results of the study indicate that the proposed method can be applied to a variety of aircraft materials, could be used in flight, and has fewer encumbrances than the other diagnostic tools currently available. The study has also revealed that the noise radiation of vibrating plates in the low frequency regime due to combined airborne and structureborne inputs possesses a strong synergistic nature. The large influence of the interaction between the airborne and structureborne terms has been hitherto ignored by researchers of aircraft interior noise problems. Author

**ANALYSIS OF THE NOISE EMITTED BY A TAIL ROTOR Final Report [ANALYSE DU BRUIT EMIS PAR UN FENESTRON]**
M. ROGER, F. FOURNIER, and P. BECKER 11 Jun. 1985 102 p refs In FRENCH
(Contract DRET-83-025)
Avail: NTIS HC A06/MF A01

A two pole tail rotor noise computation method was developed, and an experimental study of diffracting effects on the turbulence generated by the rotor was carried out. The computation predicts the noise spectra of the tail rotor. The parametric study shows that the varying properties of the incident turbulence can give different spectra. The structure design can attenuate noise by up to 20 to 30 dB. Author (ESA)

**SOUND EXCITATION DURING VORTEX-AIRFOIL INTERACTION**
R. TIMM 1985 120 p refs In GERMAN; ENGLISH summary
(MPIS-MITT-80; ISSN-0374-1257) Avail: NTIS HC A06/MF A01

Two-dimensional vortex-airfoil interaction was investigated in experiments and compared with a theoretical model. In a wind tunnel a cylinder generates a Karman vortex street and in a shock tube an asymmetric airfoil generates a starting vortex. Downstream of these vortex generators an airfoil is located. The influence of the vortices on the airfoil flow was investigated by an interferometer. Strong pressure waves originate from the leading edge of the airfoil. The order of magnitude of their amplitude and directional characteristic are experimentally determined. The experimental vortex paths can neither be correctly predicted by the developed model nor by an existing theoretical potential model.

(Contract A81/K/145)
(IZF-1985-7; TDCK-93143) Avail: NTIS HC A02/MF A01

Increase of the sound attenuation of an ear protector or a headset by the application of an Active Noise Reduction (ANR) system is discussed. As a result, the risk of hearing damage is decreased, and the quality of the communication increased. Methods to quantify these effects are described. Two ANR systems were evaluated with the measuring methods. It is found that an additional attenuation of 17 dB can be obtained at frequencies or = 500 Hz. It is concluded that the application of ANR systems is advantageous for hearing protection and speech communication in military environments. Author (ESA)

**HELICOPTER INTERNAL NOISE TREATMENT. RECENT METHODOLOGIES AND PRACTICAL APPLICATIONS**
H. J. MARZE and F. N. DAMBRA 1985 15 p Presented at 11th European Rotorcraft Forum, London, England, 10-13 Sep. 1985
(SNIAS-852-210-102) Avail: NTIS HC A02/MF A01

A methodology including helicopter noise diagnosis, definition of acoustic treatment best adapted for each panel structure, and the development, tests and improvements of internal noise treatments is set up. Noise spectra are obtained at several cabin locations and helicopter speeds. An array of noise transducers placed at 120 locations allows to set the acoustic power radiated by each structure subassembly. It is shown that the method gives a good representation the wave pattern, and it may provide sufficient detail to efficiently reduce the added weight of sound proofing treatments. Author (ESA)

F. LESUEUR (Avions Marcel Dassault-Breguet Aviation, Division Systemes d'Armes, Saint-Cloud, France), A. DEMOMENT (Crouzet, S.A., Division Aerospatiale, Valence, France), and R. ECK (Societe Francaise d'Equipements pour la Navigation Aerienne, Division Pilotage et Systemes, Velizy-Villacoublay, France) IN: International Colloquium on Reliability and Maintainability, 4th, Tregastel, France, May 21-25, 1984, Proceedings. Volume 2 . Lannion, France, Centre National d'Etudes des Telecommunications, 1984, p. 455-459. In French. Research supported by the Service Technique des Telecommunications et des Equipements Aeronautiques.

The present study is concerned with an approach to evaluate the efficiency of a weapons system. A life cycle cost model adapted to the French Air Force is considered, taking into account the costs for study and development, acquisition, and operation. The relative effect of the different parameters is discussed. The concept of operational availability is explored, and the different factors for modelling it are analyzed. Attention is given to hypotheses and limits, the various parts of a mission, the weapons system, maintenance, and aspects of modelling. It is pointed out that the two model concepts for life cycle cost and operational availability represent factors which can be used separately and jointly in the evaluation of a weapons system. G.R.

**OPERATING EXPERIENCE IN THE JEFF (A) IN THE ARCTIC**
J. J. EDWARDS (RMI Co., National City, CA) ASME, International Gas Turbine Conference and Exhibit, 30th, Houston, TX, Mar. 18-21, 1985. 6 p.
(ASME PAPER 85-GT-127)

The present article is concerned with studies regarding the use of air cushion vehicles (ACV) in the Arctic. These studies included the use of the Jeff (A), an air cushion landing craft obtained from the U.S. Navy, for operations in Alaska. It is pointed out that the overall performance of Jeff (A) running in the Arctic after the incorporation of relatively few cold weather modifications was truly commendable. The modifications included the use of compliant or low viscosity materials at the operating temperature. In addition, it was found to be important to keep equipment warm, or at least in a state in which the cooling to extremely cold temperatures would be avoided. After these requirements were satisfied, craft performance became more than satisfactory. In January of 1984, the Jeff (A) initiated cargo service to Mukluk Island in support of drilling activity. **AIRFRAME DESIGN TO ACHIEVE MINIMUM COST**
B.R. NOTON (Battelle Memorial Institute, Columbus, OH) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 18-1 to 18-11. refs

Cost drivers related to aircraft performance, design, material selection and manufacturing are discussed, and also those related to industry in general. The design objectives and manufacturing technology requirements for low-speed and high-speed aircraft are illustrated to indicate possible cost drivers. The importance of the early developmental phases to reduce cost of engineering systems, is emphasized. To minimize cost drivers, the Air Force has developed a 'Manufacturing Cost/Design Guide' which puts designers on the lowest cost track early in the design phase and also enables trade-off studies to be conducted while developing alternative structural configurations. The methodology used to address cost drivers and to quantify these ae reviewed. Due to problems of cyclic production and stretched-out delivery schedules, some guidance is provided to designers with respect to the importance of learning curves. A worksheet is provided for designers to summarize the cost of parts, subassemblies and the program aircraft. Author

# GENERAL

**A86-22129#**
**THE WRIGHT BROTHERS EXPERIENCE IN THE EVOLUTION OF AIRCRAFT DESIGN, STRUCTURES, AND MATERIALS**
C. A. DEMPSEY (Wright B. Flyer, Inc., Dayton, OH) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 1-1 to 1-13. refs

This paper discusses the work of the Wright Brothers in the evolution of aircraft design, structures, and materials. It describes and gives specific details about their efforts in establishing requirements for the aircraft development program. Influence of the requirements on the new technology development process is discussed with regard to the three axis flight control system, structures, materials, and air vehicles performance. The transition of this technology to later aviation developments is discussed. The paper does not cover the entire Wright Brothers program but clearly defines their procedure in conservative innovation and standardized design technique. It further shows that the 1902 glider (Wright Brothers patent) was the culmination of their research, since this vehicle became the standard for all their other activities. Author

**AIRCRAFT DESIGN - FROM THE MYTH OF MAKE-DO TO MACH 3**
R. P. HALLION (USAF, Flight Test Center, Edwards AFB, CA) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 2-1 to 2-5.

The development of aerospace vehicle design technology has always been dependent upon a strong data base derived from analytical studies, ground, and flight research. An examination of the history of aircraft design reveals several major periods from the Wright brothers through the end of the 1950's during which new technological capabilities were developed, refined, and put into practice with both military and civilian aircraft. **THE EVOLUTION OF RECIPROCATING ENGINES AT LYCOMING**
A. E. LIGHT (Avco Corp., Avco Lycoming Williamsport Div., Williamsport, PA) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 9-1 to 9-4.

The paper summarizes the history of reciprocating engines at Lycoming from production of automotive engines in 1910 through present production of general aviation engines in 1984. Technical advancements and specification of early automotive, radial aircraft, and present opposed cylinder engines are induced. Lycoming has developed reciprocating engines from 30 horsepower to 5,000 horsepower. Lycoming holds FAA type certificates for over 600 reciprocating aircraft engine models. Author

**X-15 HIGH TEMPERATURE ADVANCED STRUCTURE**

J. RAPP (Rockwell International Corp., El Segundo, CA) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 13-1 to 13-3.

The X-15 Advanced Research Vehicle was a design challenge with problems not even envisioned at the outset. The objective was to design and build a manned space flight vehicle capable of very high speed and altitude which could be used to study effects of weightlessness in space. The greatest problem to solve was to select materials to withstand extremely high temperatures to be encountered and then to develop techniques to fabricate and assemble them. Additional structural problems resulted from differential heating of external skins and the sub-structure, which caused a twofold dilemma of secondary induced stresses while simultaneously reducing the allowables. The vehicle also had to have flight control systems that would operate above the atmosphere and after engine burnout. Author

**X-20 STRUCTURES OVERVIEW**

A. K. HEPLER (Boeing Aerospace Co., Seattle, WA) IN: Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings . Dayton, OH, American Institute of Aeronautics and Astronautics, 1985, p. 14-1 to 14-8.

The material and structural development during the X-20 (Dyna-Solar) Program demonstrated the feasibility of a multimission aircraft primary structural system capable of operating at temperatures up to 1650 F. Further, coated refractory alloys were developed for use in leading edge shells and in outer surface panels where temperatures up to 2900 F were experienced. The material and structural design concepts obtained during the X-20 Program represent the bulk of todays (1985) technology for high temperature aircraft structural systems. These validated data provide an excellent source for supporting the conceptual definition of hot structure airframe systems for Advanced Military Aircraft as the Transatmospheric Vehicle (TAV). ## Typical Subject Index Listing

SUBJECT HEADING
AIRCRAFT TIRES
A study of the cornering forces generated by aircraft tires on a tilted, free-swiveling nose gear
[NASA-TP-2481] p 64 N86-11522
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of the document content, the title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

Airfoil aerodynamics in icing conditions
p 204 A86-20164

Euler solvers as an analysis tool for aircraft aerodynamics p 204 A86-20939

A vortex lattice method for jet wing performance with nonlinear wake and tip flow p 205 A86-22311

**AEROELASTICITY**

Divergence study of a high-aspect ratio, forward-swept wing
[AIAA PAPER 86-0009] p 219 A86-19632

Aeroelastic tailoring - Theory, practice, and promise
[AIAA PAPER 84-0982] p 220 A86-20155

Control of a forward-swept-wing configuration dominated by flight dynamic/aeroelastic interactions
p 239 A86-20237

A FORTRAN program for the determination of unsteady airforces on general combinations of interfering lifting surfaces oscillating in subsonic flow
[ARL-STRUCT-R-412] p 206 N86-16191

**AERONAUTICAL ENGINEERING**

Coupling artificial intelligence and numerical computation for engineering design (Invited paper)
[AIAA PAPER 86-0242] p 254 A86-22684

Flight dynamics and aircraft piloting
[ESA-TT-874] p 240 N86-16229

The role of computational fluid dynamics in aeronautical engineering
[REPT-2] p 257 N86-17296

**AERONAUTICAL SATELLITES**

A shared satellite system would satisfy many future aviation needs p 249 A86-20921

**AERONAUTICS**

Activities report in aeronautics p 198 N86-16189

**AEROSPACE ENGINEERING**

Activities report in aerospace research, with data concerning the scientific committee NLR-NIVR, international cooperation concerning AGARD, DNW, GARTEUR and cooperation with Indonesia
p 257 N86-17588

**AEROSPACE INDUSTRY**

Air and space flight. Dream and facts
[MBB-FILM-382] p 198 N86-16188

**AEROSPACE TECHNOLOGY TRANSFER**

Composites technology transfer and transition
p 253 A86-22144

Composite materials: A source of innovation — aircraft industry
[SNIAS-852-430-113] p 248 N86-17493

**AEROSPACE VEHICLES**

The lightning threat to aerospace vehicles
p 214 A86-20162

**AH-64 HELICOPTER**

Protective respirator for the AAH-64 Advanced Attack Helicopter p 261 A86-19336

**AILERONS**

SF-340 airfoil structure - A unique approach
p 224 A86-21712

**AIR INTAKES**

Design of nonaxysymmetric structures (turbojet engine nacelle element)
[SNIAS-852-430-119] p 248 N86-17498

**AIR LAND INTERACTIONS**

An extreme clear air turbulence incidence associated with a strong downslope windstorm
[AIAA PAPER 86-0329] p 259 A86-19816

**AIR NAVIGATION**

Towards robust image matching algorithms
p 230 A86-19620

**AIR POLLUTION**

Dispersion process of jet engine exhaust plume. II - Buoyant jet p 234 A86-20448

**AIR TO AIR REFUELING**

Probe and drogue refuelling large receiver aircraft
p 223 A86-21062

**AIR TRAFFIC**

General Aviation and Regional Air Traffic - Components of the Traffic System, Symposium, Friedrichshafen, West Germany, March 28, 29, 1985, Reports
p 197 A86-21325

**AIR TRAFFIC CONTROL**

A shared satellite system would satisfy many future aviation needs p 249 A86-20921

Evolution of the air traffic control beacon system
p 215 A86-21606

Radars in air traffic control - A status report
p 216 A86-21607

Plessey displays in air traffic control
p 216 A86-21608

Aircraft accident report: Midair collision of Wings West Airlines Beech C-99 (N666U) and Aesthetec Inc., Rockwell Commander (N112SM), near San Luis Obispo, California, August 24, 1984
[NTSB/AAR-85/07] p 214 N86-16207

AFOS (Automation of Field Operations and Services) monitory of terminal forecasts
[PB85-236388] p 260 N86-16843

Markov jump-diffussion models and decision-making free filtering — air traffic control
[NLR-MP-83067-U] p 264 N86-17046

Activities in air traffic control p 216 N86-17331

A sophisticated tracking algorithm for Air Traffic Control (ATC) surveillance radar data
[NLR-MP-84004-U] p 216 N86-17334

Comparison of a jump-diffusion tracker with a Kalman tracker: An evaluation with emphasis on air traffic control
[NLR-TR-83063-U] p 216 N86-17335

An efficient filter for abruptly changing systems
[NLR-MP-84071-U] p 264 N86-18056

**AIR TRANSPORTATION**

General Aviation and Regional Air Traffic - Components of the Traffic System, Symposium, Friedrichshafen, West Germany, March 28, 29, 1985, Reports
p 197 A86-21325

Activities report in aeronautics p 198 N86-16189

**AIRBORNE EQUIPMENT**

The CA-810 - A modern tri-lens camera
p 228 A86-19577

PC-183B standoff imaging system
p 229 A86-19578

Application of biocular viewers to airborne reconnaissance p 229 A86-19580

KS-146A camera development and flight test results
p 229 A86-19583

Description of and results from camera systems for recording daytime lightning strikes to an airplane in flight
[AIAA PAPER 84-0020] p 230 A86-19636

Development of an airborne CCD scanner for land and sea applications p 231 A86-21163

Comparison of calculated and measured height profiles of transverse electric VLF signals across the daytime earth-ionosphere waveguide p 250 A86-21513

The application of sensors in light tests
[NLR-MP-84056-U] p 232 N86-17352

**AIRBORNE LASERS**

Laser systems for use with airborne platforms
p 228 A86-19571

**AIRBORNE/SPACEBORNE COMPUTERS**

Local area command/control networks: The design of an on-board network - ANTINEA — French thesis
p 215 A86-21327

Analysis of the F/A-18 Hornet flight control computer field mean time between failure p 231 A86-22386

Hardware/software Failure Mode Effect Analysis (FMEA) applied to airplane safety
[NLR-MP-84073-U] p 215 N86-17325

Activities report in aerospace research, with data concerning the scientific committee NLR-NIVR, international cooperation concerning AGARD, DNW, GARTEUR and cooperation with Indonesia
p 257 N86-17588

**AIRCRAFT**

Upsilon invariants - A uniform set of moment invariants p 262 A86-19608

**AIRCRAFT ACCIDENT INVESTIGATION**

Accident investigation as a way of assessing aviation life support system performance p 212 A86-19323

Determining the effects of weather in aircraft accident investigations
[AIAA PAPER 86-0323] p 213 A86-19813

Meteorological factors in selected aircraft accident investigations
[AIAA PAPER 86-0324] p 213 A86-19814

Aircraft accident report: Midair collision of Wings West Airlines Beech C-99 (N666U) and Aesthetec Inc., Rockwell Commander (N112SM), near San Luis Obispo, California, August 24, 1984
[NTSB/AAR-85/07] p 214 N86-16207

**AIRCRAFT ACCIDENTS**

How much inherent buoyancy is acceptable in a helicopter passenger immersion suit
p 261 A86-19310

The effect of water ingress on buoyancy and thermal quality of survival suits p 261 A86-19333

Weather-involved U.S. air carrier accidents 1962-1984 - A compendium and brief summary
[AIAA PAPER 86-0327] p 214 A86-19815

Airport preparedness for mass disaster - A proposed schematic plan p 214 A86-20411

Controlled Impact Demonstration (CID)
[GPO-46-870] p 214 N86-17324

**AIRCRAFT COMMUNICATION**

A shared satellite system would satisfy many future aviation needs p 249 A86-20921

Local area command/control networks: The design of an on-board network - ANTINEA — French thesis
p 215 A86-21327

Airborne communications reconstitution experiments
p 251 A86-21891

**AIRCRAFT CONFIGURATIONS**

Shaping of airplane fuselages for minimum drag
[AIAA PAPER 86-0316] p 201 A86-19809

Three-dimensional body-fitting grid system for a complete aircraft
[AIAA PAPER 86-0428] p 201 A86-19870

Investigation of aircraft departure susceptibility using a total-G simulator
[AIAA PAPER 86-0492] p 238 A86-19903

Conformal mapping as an aid in grid generation for complex three-dimensional configurations
[AIAA PAPER 86-0497] p 203 A86-19908

Aircraft viscous drag reduction technology
p 204 A86-20124

The numerical solution of the compressible viscous flow field about a complete aircraft in flight
p 205 A86-21033

Flight testing the fixed wing configuration of the Rotor Systems Research Aircraft (RSRA) p 223 A86-21064

Multi-knot Boolean sum interpolating surface interactive design of aircraft configuration p 263 A86-22305

A FORTRAN program for the determination of unsteady airforces on general combinations of interfering lifting surfaces oscillating in subsonic flow
[ARL-STRUCT-R-412] p 206 N86-16191

**AIRCRAFT CONSTRUCTION MATERIALS**

Thermographic inspection of carbon epoxy structures
p 249 A86-20649

Recent developments in carbon fibre composite
p 244 A86-21296

Effect of manufacturing defects and service-induced damage on the strength of aircraft composite structures
p 245 A86-21729

Composite fabrics in a thermal protection application
p 245 A86-21734

Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings p 197 A86-22128

The Wright Brothers experience in the evolution of aircraft design, structures, and materials
p 267 A86-22129

XB-70 structures and materials advancements
p 224 A86-22131

Starship 1 p 225 A86-22133

Structural and material considerations for advanced fighters p 252 A86-22134

Composites technology transfer and transition p 253 A86-22144

The applications of composite materials in the aeronautical domain [SNIAS-852-551-103] p 247 N86-16279

Lecture notes on fatigue, static tensile strength and stress corrosion of aircraft materials and structures. Part 2: Figures [VTH-LR-380-PT-2] p 227 N86-17345

Seperation of airborne and structureborne noise radiated by plates constructed of conventional and composite materials with applications for prediction of interior noise paths in propeller driven aircraft [NASA-TM-87414] p 265 N86-18121

**AIRCRAFT CONTROL**

Use of differential leading edge flaps for lateral control at high angle of attack [AIAA PAPER 86-0168] p 236 A86-19729

Investigation of aircraft departure susceptibility using a total-G simulator [AIAA PAPER 86-0492] p 238 A86-19903

Endurance increase by cyclic control — of aircraft p 221 A86-20235

Design of an active flutter suppression system p 239 A86-20236

Comparison of performance characteristics of DDC algorithms implemented on a microprocessor — Direct Digital Control p 263 A86-20518

Probe and drogue refuelling large receiver aircraft p 223 A86-21062

Flight stability and controllability. II - Aircraft longitudinal stability — Serbo-Croation book p 239 A86-21318

Talking to your aircraft p 239 A86-21900

Facility for closed loop testing of aircraft control systems p 241 A86-22188

Flight dynamics and aircraft piloting [ESA-TT-874] p 240 N86-16229

Airworthiness flight test program of an aircraft equipment fairing p 226 N86-16653

Development of a knowledge acquisition tool for an expert system flight status monitor [NASA-TM-86802] p 263 N86-16944

Computer Aided Design (CAD) at the National Aerospace Laboratory (Netherlands) with the accent on aircraft flight control systems [NLR-MP-84032-U] p 264 N86-18030

**AIRCRAFT DESIGN**

The future of advanced crew escape capsule technology p 217 A86-19306

Lubrication and performance of high-speed rolling-element bearings p 248 A86-19375

Design of a twin-engine short-haul commuter aircraft for the 1990s [AIAA PAPER 86-0077] p 219 A86-19674

Propeller design by optimization [AIAA PAPER 86-0081] p 232 A86-19678

Exploratory investigation of deflectable forebody strakes for high angle of attack yaw control [AIAA PAPER 86-0333] p 238 A86-19819

Control methodology for stochastic system characteristics modulation [AIAA PAPER 86-0335] p 262 A86-19821

Definition and verification of a complex aircraft for aerodynamic calculations [AIAA PAPER 86-0431] p 202 A86-19873

Use of simulation during preliminary design of the V-22 Osprey [AIAA PAPER 86-0491] p 238 A86-19902

The damage tolerance approach in the type approval process p 220 A86-20036

Research on high-strength aerospace aluminum alloys p 244 A86-20037

Assessing cost-effective weight saving in aircraft operations p 220 A86-20039

Aircraft viscous drag reduction technology p 204 A86-20124

Bigger is better - Stretching the C-141 Starlifter p 220 A86-20125

Aeroelastic tailoring - Theory, practice, and promise [AIAA PAPER 84-0982] p 220 A86-20155

Blended blown flaps and vectored thrust for low-speed flight [AIAA PAPER 84-2199] p 221 A86-20157

Finite element analysis of an ultralight aircraft p 221 A86 20165

A numerical method for the design and analysis of counter-rotating propellers [AIAA PAPER 84-1205] p 233 A86-20369

Geometry generation for transonic design p 221 A86-20932

Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-29, 1984, Proceedings p 221 A86-21051

F-20A Tigershark progress report p 222 A86-21057

Designing an airlifter - McDonnell Douglas's C-17 p 224 A86-21697

3-D design of turbine airfoils [ASME PAPER 85-GT-188] p 236 A86-22101

The F-16 Common Engine Bay [ASME PAPER 85-GT-231] p 224 A86-22127

The Wright Brothers experience in the evolution of aircraft design, structures, and materials p 267 A86-22129

Aircraft design - From the myth of make-do to Mach 3 p 267 A86-22130

Structural evolution B-58 to F-16 p 225 A86-22132

X-20 structures overview p 268 A86-22138

Airframe design to achieve minimum cost p 267 A86-22141

AV-8B design for maintainability p 225 A86-22378

Some comparisons of US and USSR aircraft design developments [NASA-TM-87611] p 214 N86-16208

The applications of composite materials in the aeronautical domain [SNIAS-852-551-103] p 247 N86-16279

A different approach to designed in passive damping p 256 N86-16627

Activities report in aircraft development and astronautics p 267 N86-17233

The comparison of the transonic airfoil calculation by NSFOIL with the wind tunnel test data at high Reynolds number p 210 N86-17295

The role of computational fluid dynamics in aeronautical engineering [REPT-2] p 257 N86-17296

Application of computational aerodynamics to wing design p 226 N86-17297

A numerical solution of the transonic integral equation and its application to three-dimensional transonic wing design p 226 N86-17298

A wing design based on the three-dimensional transonic inverse method and the comparison with the wind tunnel testing data p 226 N86-17299

Aerodynamic design trends for commercial aircraft [NASA-TM-77976] p 227 N86-17338

Damage-tolerant aircraft design [NLR-MP-84005-U] p 227 N86-17342

Optimization in design processes: An informatics point of view [NLR-MP-84074-U] p 228 N86-17349

Computer Aided Design (CAD) at the National Aerospace Laboratory (Netherlands) with the accent on aircraft flight control systems [NLR-MP-84032-U] p 264 N86-18030

**AIRCRAFT DETECTION**

Air targeting of the third kind - Airborne vehicles p 230 A86-19617

Infrared emission from jet engine exhaust plumes [AIAA PAPER 86-0465] p 233 A86-19888

**AIRCRAFT ENGINES**

An analytical investigation of the effects of swirler design on the performance of annular propulsive nozzles [AIAA PAPER 86-0587] p 233 A86-19965

Evolution and status of CFD techniques for scramjet applications [AIAA PAPER 86-0160] p 248 A86-19970

Variable cyclic turboshaft technology for rotorcraft of the '90s p 233 A86-20371

Synchronizing characteristics of a large variable frequency starting system p 249 A86-20516

High strength nickel-palladium-chromium brazing alloys p 244 A86-20579

PM techniques for making near-net-shape titanium alloy components p 246 A86-21756

'Smart' engine components - A micro in every blade? p 234 A86-21896

Cold flow and combustion experiments with a new burner air distribution concept [ASME PAPER 85-GT-40] p 235 A86-22029

Dynamic analysis of complex composite rotor systems with substructure transfer matrix method [ASME PAPER 85-GT-74] p 235 A86-22049

Power dense gas turbine APUs [ASME PAPER 85-GT-124] p 235 A86-22074

An improved simple method for designing optimum annular diffusers [ASME PAPER 85-GT-126] p 235 A86-22075

NASA Lewis Research Center/university graduate research program on engine structures [ASME PAPER 85-GT-159] p 252 A86-22084

Re-engining the Harrier [ASME PAPER 85-GT-175] p 235 A86-22091

T56 derivative engine in the improved E-2C [ASME PAPER 85-GT-176] p 236 A86-22092

F-14 re-engining with the F110 engine [ASME PAPER 85-GT-184] p 224 A86-22098

Developing concepts in the rotordynamic analysis of aero gas turbines [ASME PAPER 85-GT-230] p 236 A86-22126

The F-16 Common Engine Bay [ASME PAPER 85-GT-231] p 224 A86-22127

The evolution of reciprocating engines at Lycoming p 267 A86-22135

Evolution of the turbofan aircraft engine p 236 A86-22136

Maintenance strategies for aero engines p 253 A86-22384

Small propulsion engine LCC considerations p 267 A86-22399

The technical development of cooled gas turbine blades [PNR-90292] p 255 N86-16595

Aircraft noise control: Prospects for the 21st century [PNR-90272] p 260 N86-16757

Description of a nondestructive facility using holographic interferometry [SNIAS-852-430-105] p 258 N86-17726

**AIRCRAFT EQUIPMENT**

Approach for service life extension of explosive devices for aircraft escape systems p 243 A86 19349

Computer controlled operation of reconnaissance cameras p 229 A86-19587

Sensor control and film annotation for long range, standoff reconnaissance p 230 A86-19597

Designing an electro-impulse de-icing system [AIAA PAPER 86-0545] p 220 A86-19940

Airworthiness flight test program of an aircraft equipment fairing p 226 N86-16653

**AIRCRAFT FUEL SYSTEMS**

Electrodeposited primer scale-up and qualification p 245 A86-21735

**AIRCRAFT FUELS**

Long term deposit formation in aviation turbine fuel at elevated temperature [AIAA PAPER 86-0525] p 243 A86-19929

The quantification and improvement of the thermal stability of aviation turbine fuel [ASME PAPER 85-GT-33] p 247 A86-22022

USAF toxicology research on petroleum and shale-derived aviation gas turbine fuels [ASME PAPER 85-GT-34] p 262 A86-22023

The effect of fuel composition upon combustion performance in a Rolls Royce Tyne combustor [ASME PAPER 85-GT-39] p 234 A86-22028

Research on antimisting fuel for suppression of postcrash aircraft fires [AIAA PAPER 86-0573] p 247 A86-22706

**AIRCRAFT GUIDANCE**

Terrain following avoidance technique of very low altitude penetration p 239 A86-22309

**AIRCRAFT HAZARDS**

Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes [AIAA PAPER 86-0021] p 213 A86-19637

The lightning threat to aerospace vehicles p 214 A86-20162

Controlled Impact Demonstration (CID) [GPO-46-870] p 214 N86-17324

**AIRCRAFT INDUSTRY**

Air and space flight. Dream and facts [MBB-FILM-382] p 198 N86-16188

Problems found when introducing new materials — aircraft industry [SNIAS-852-551-101] p 198 N86-16190

Nondestructive inspection: An efficient investment — composite materials [SNIAS-852-430-110] p 247 N86-16276

Systems safety: Phantom or reality [SNIAS-852-422-103] p 215 N86-17330

Study of composite material curing molds [DGT-26.817] p 248 N86-17486

Composite materials: A source of innovation — aircraft industry [SNIAS-852-430-113] p 248 N86-17493

**AIRCRAFT INSTRUMENTS**

Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984 [SPIE-496] p 228 A86-19576

A new generation advanced I.R. Linescan Sensor system p 229 A86-19585

Camera flight tests and image evaluation p 230 A86-19591

Helicopter fatigue monitoring using a single channel recorder p 220 A86-20038

United States Coast Guard acquisition of remote sensing capability for ocean surveillance p 231 A86-21234

**AIRCRAFT LANDING**

A flightpath overshoot flying qualities metric for the landinig task
[AIAA PAPER 86-0334] p 236 A86-19820

Aircraft terminal area guidance based on the discrete tracking problem of optimal control theory
p 215 A86-20520

Conventional takeoff and landing (CTOL) airplane ski jump evaluation p 222 A86-21058

Helicopter-ship qualification testing
[NLR-MP-84062-U] p 227 N86-17343

Operational application of the STALINS method for measuring take-off and landing trajectories
[NLR-TR-83010-U] p 227 N86-17346

**AIRCRAFT MAINTENANCE**

Aviation maintenance management — Book
p 197 A86-21055

AV-8B design for maintainability p 225 A86-22378

Maintenance strategies for aero engines
p 253 A86-22384

Relating factory and field reliability and maintainability measures p 253 A86-22391

Small propulsion engine LCC considerations
p 267 A86-22399

A multiple-parameter allocation process
p 254 A86-22407

Dynamics R and D in the AFWAL Structures and Dynamics Division p 256 N86-16618

**AIRCRAFT MANEUVERS**

The Adaptive Maneuvering Logic program in support of the pilot's associate program - A heuristic approach to missile evasion
[AIAA PAPER 86-0423] p 263 A86-19865

Flight test maneuver modeling and control
[AIAA PAPER 86-0426] p 219 A86-19866

Modeling aerodynamic responses to aircraft maneuvers - A numerical validation p 204 A86-20156

Markov jump-diffusion models and decision-making free filtering — air traffic control
[NLR-MP-83067-U] p 264 N86-17046

A sophisticated tracking algorithm for Air Traffic Control (ATC) surveillance radar data
[NLR-MP-84004-U] p 218 N86-17334

Three-dimensional flight-path reconstruction by means of spline approximation
[NLR-TR-83091-U] p 228 N86-17347

**AIRCRAFT MODELS**

Evaluation of an aerodynamic-load prediction method on a STOL fighter configuration
[AIAA PAPER 86-0590] p 203 A86-19966

Development of a sensitivity analysis technique for multiloop flight control systems
[NASA-CR-166619] p 240 N86-17356

**AIRCRAFT NOISE**

Laboratory study of the effects of sidewall treatment, source directivity and temperature on the interior noise of a light aircraft fuselage
[AIAA PAPER 86-0390] p 219 A86-19851

The effect of acoustic reflections on combustor noise measurements p 265 A86-20364

Report of the Working Group for Sensitivity Analysis and Zoning Calculations (GAZOB) p 259 N86-16749

Analysis and conclusions of the working Group for Sensitivity Analysis and Zoning Calculations (GAZOB)
p 259 N86-16750

Aircraft noise control: Prospects for the 21st century
[PNR-90272] p 260 N86-16757

Noise reduction technology
[GPO-48-026] p 265 N86-17076

Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance: Preliminary results
[NASA-TM-87637] p 265 N86-17077

Environment-friendly propeller aircraft with a maximum weight of 5700 kg, and motor gliders: Publication of the noise values p 227 N86-17341

Noise assessment around Schiphol airport (the Netherlands) in 1981
[NLR-TR-82034-U] p 260 N86-17915

Separation of airborne and structureborne noise radiated by plates constructed of conventional and composite materials with applications for prediction of interior noise paths in propeller driven aircraft
[NASA-TM-87414] p 265 N86-18121

Analysis of the noise emitted by a tail rotor
p 266 N86-18129

Helicopter internal noise treatment. Recent methodolgies and practical applications
[SNIAS-852-210-102] p 266 N86-18133

**AIRCRAFT PERFORMANCE**

The electrodynamic operation of electro-impulse deicing systems
[AIAA PAPER 86-0547] p 220 A86-19841

Performance of a forward swept wing fighter utilizing thrust vectoring and reversing p 221 A86-20183

Airfoil aerodynamics in icing conditions
p 204 A86-20164

AV-8B initial sea trials p 222 A86-21054

Conventional takeoff and landing (CTOL) airplane ski jump evaluation p 222 A86-21058

Non-rigid airship testing p 223 A86-21059

Testing Canadian unique features of the CF-18 - The first year p 223 A86-21060

Probe and drogue refuelling large receiver aircraft
p 223 A86-21062

F-15 Dual-Role Fighter flight testing
p 224 A86-21065

Basic aircraft performance — Book
p 224 A86-21306

Designing an airlifter - McDonnell Douglas's C-17
p 224 A86-21897

Canard Mirage on test p 225 A86-22261

Estimation of drag due to inoperative turbo-jet and turbo-fan engines using data item nos. 81009 and 84004
[ESDU-84005] p 211 N86-17305

Critical analysis of turbulence restitution from acceleration measurements — aircraft construction
[ONERA-RT-3/3567-RY-C40-R] p 227 N86-17340

**AIRCRAFT PILOTS**

Talking to your aircraft p 239 A86-21900

**AIRCRAFT POWER SUPPLIES**

AV-8B design for maintainability p 225 A86-22378

**AIRCRAFT PRODUCTION COSTS**

Problems found when introducing new materials — aircraft industry
[SNIAS-852-551-101] p 198 N86-16190

**AIRCRAFT RELIABILITY**

The damage tolerance approach in the type approval process p 220 A86-20036

A case study in fatigue life extension - The main spar of RAAF Mirage IIIO wings p 225 A86-22165

The Air Force approach to environmental stress screening p 253 A86-22192

The automated, advanced matrix FMEA technique — Failure Modes and Effects Analysis p 253 A86-22382

F/A-18 Hornet - Reliability development testing
p 225 A86-22400

Is there life after 10,000 flight hours?
p 254 A86-22402

A multiple-parameter allocation process
p 254 A86-22407

The Shock and Vibration Bulletin 55. Part 2: Dynamic testing, flight vehicle dynamics, seismic loads and fluid-structure interaction
[AD-A160264] p 257 N86-16646

Airworthiness flight test program of an aircraft equipment fairing p 226 N86-16653

**AIRCRAFT SAFETY**

SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings
p 212 A86-19301

Computer tools and techniques for analysis of discrete data from aircrew automated escape systems (AAES)
p 260 A86-19302

The future of advanced crew escape capsule technology p 217 A86-19306

Development of mechanical components for advanced aircrew seating systems p 217 A86-19307

The continuing requirement for helicopter escape
p 217 A86-19308

U.S. Navy ALSS corporate report 1984
p 261 A86-19309

F-111 escape systems - Today's module technology
p 217 A86-19311

The use of TLX energy transfer lines on the F-16 aircraft — Thin Layer eXplosive p 243 A86-19313

Ballistic gas fired devices p 240 A86-19328

Pilot underwater high pressure emergency breathing system p 201 A86-19343

The state of the art of anthropomorphic manikins and requirements for the evaluation of advanced aircraft ejection systems p 262 A86-19345

A philosophical basis for the use of high-performance, gliding parachutes in ejection seat aircraft
p 213 A86-19352

Airfoil aerodynamics in icing conditions
p 204 A86-20164

Hardware/software FMEA applied to airplane safety
p 253 A86-22396

CERR: An aviation verification program
[PB85-204824] p 260 N86-16854

Systems safety: Phantom or reality
[SNIAS-852-422-103] p 215 N86-17330

**AIRCRAFT SPIN**

Evaluation of pilot performance and aircrew protective devices in a simulated F-14 flat spin environment
p 262 A86-19051

**AIRCRAFT STABILITY**

Experimental study of effects of forebody geometry on high angle of attack static and dynamic stability
[AIAA PAPER 86-0331] p 236 A86-19818

Flight stability and controllability. II - Aircraft longitudinal stability — Serbo-Croatian book p 239 A86-21318

Hardware/software Failure Mode Effect Analysis (FMEA) applied to airplane safety
[NLR-MP-84073-U] p 215 N86-17325

Estimation of sideforce, yawing moment and rolling moment derivatives due to rate of yaw for complete aircraft at subsonic speeds
[ESDU-84002] p 240 N86-17357

**AIRCRAFT STRUCTURES**

Finite element analysis of an ultralight aircraft
p 221 A86-20165

Structural demonstration of the AV-8B Harrier II
p 223 A86-21061

SPF aluminum - A first for the S-76B helicopter — Superplastic Forming p 250 A86-21709

Requirements for tailoring of material properties of viscoelastically damped bonded laminates in aircraft structures p 250 A86-21714

Improved temperature resistant sealants for composite & adhesive bonded fuel-tank structures
p 246 A86-21736

Unique tooling and manufacturing approach for large advanced composite aircraft structure
p 246 A86-21742

Toward automated airframe assembly
p 197 A86-21894

Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings p 197 A86-22128

The Wright Brothers experience in the evolution of aircraft design, structures, and materials
p 267 A86-22129

XB-70 structures and materials advancements
p 224 A86-22131

Structural evolution B-58 to F-16 p 225 A86-22132

Structural and material considerations for advanced fighters p 252 A86-22134

X-15 high temperature advanced structure
p 268 A86-22137

X-20 structures overview p 268 A86-22136

Transition of advanced materials and structures - Single crystal blades p 252 A86-22143

Performance of AV-8B Harrier II structural test program p 241 A86-22189

Recursive instrumental variable algorithms for modal parameter estimation of structural system
p 263 A86-22306

Fatigue life monitoring of aircraft
[NLR-MP-83069-U] p 226 N86-16211

AGARD Corrosion Handbook. Volume 1: Corrosion, causes and case histories
[AGARD-AG-278-VOL-1] p 248 N86-16374

Airworthiness flight test program of an aircraft equipment fairing p 226 N86-16653

Damage-tolerant aircraft design
[NLR-MP-84005-U] p 227 N86-17342

Lecture notes on fatigue, static tensile strength and stress corrosion of aircraft materials and structures. Part 2: Figures
[VTH-LR-360-PT-2] p 227 N86-17345

Feasibility study of a device to control aircraft electromagnetic protection — transparence
[ONERA-RS-10/3486-PY] p 257 N86-17637

Design of hat-stiffened composite panels under uniaxial compression and shear. Minimum mass optimization based on a simplified theory
[VTH-LR-312] p 259 N86-17806

**AIRCRAFT TIRES**

Surface properties-vehicle interaction
[PB85-242576] p 255 N86-16428

**AIRCRAFT WAKES**

An experimental investigation of propeller wakes using a laser Doppler velocimeter
[AIAA PAPER 86-0080] p 232 A86-19677

A vortex lattice method for jet wing performance with nonlinear wake and tip flow p 205 A86-22311

Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187

**AIRFOIL PROFILES**

SF-340 airfoil structure - A unique approach
p 224 A86-21712

3-D design of turbine airfoils
[ASME PAPER 85-GT-188] p 236 A86-22101

An eleven parameter axial turbine airfoil geometry model
[ASME PAPER 85-GT-219] p 205 A86-22117

Pressure distributions from high Reynolds number tests of a Boeing BAC 1 airfoil in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87600] p 208 N86-16199
Investigation of the aerodynamic forces on bluff bodies at high Reynolds numbers
[ESA-TT-914] p 209 N86-16206
A system for computer aided analysis and design of multielement airfoils: MAD
[NLR-TR-83136-U] p 212 N86-17321
**AIRFOILS**
Oscillating hot-wire measurements above an FX63-137 airfoil
[AIAA PAPER 86-0012] p 196 A86-19635
Computation of dynamic stall of NACA0012 airfoil by block pentadiagonal matrix scheme
[AIAA PAPER 86-0118] p 199 A86-19697
Lift-curve characteristics for an airfoil pitching at constant rate
[AIAA PAPER 86-0117] p 199 A86-19698
Vortices produced by air pulse injection from the surface of an oscillating airfoil
[AIAA PAPER 86-0116] p 199 A86-19699
Acoustic and turbulence influences on stall hysteresis
[AIAA PAPER 86-0170] p 200 A86-19731
Vortex-airfoil interaction tests
[AJAA PAPER 86-0354] p 201 A86-19833
Aerodynamic measurements of an airfoil with simulated glaze ice
[AIAA PAPER 86-0484] p 202 A86-19887
Airfoil aerodynamics in icing conditions
p 204 A86-20164
Development of a design model for airfoil leading edge film cooling
[ASME PAPER 85-GT-120] p 252 A86-22073
Transition of advanced materials and structures - Single crystal blades p 252 A86-22143
Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187
Implicit finite-difference methods for the calculation of unsteady transonic potential flow around two-dimensional airfoils: A discussion
[NLR-MP-83063-U] p 206 N86-16202
Calculations of transonic flows around single and multielement airfoils on a small computer
[REPT-84-48] p 208 N86-16205
Image processing of aerodynamic data
[NASA-TM-87629] p 255 N86-16553
Numerical simulation of unsteady flow around an airfoil by finite difference solution of Navier-Stokes equations
p 209 N86-17273
Transonic internal flow about an airfoil oscillating in pitch: Comparisons between computation and experiment
p 209 N86-17278
Numerical analysis for steady transonic flows past an airfoil using AF scheme p 209 N86-17289
Numerical solution of viscous compressible flows past an airfoil using unconditionally stable explicit method
p 210 N86-17290
Numerical analysis about flow over an aerofoil with a large angle of attack p 210 N86-17291
Numerical analysis of transonic flow around two-dimensional airfoil by solving Navier-Stokes equations p 210 N86-17292
Analysis of high Reynolds number transonic flow around an airfoil p 210 N86-17293
Validation and comparison with experiment of a high Reynolds number transonic flow airfoil analysis code NSFOIL p 210 N86-17294
The comparison of the transonic airfoil calculation by NSFOIL with the wind tunnel test data at high Reynolds number p 210 N86-17295
The role of computational fluid dynamics in aeronautical engineering
[REPT-2] p 257 N86-17296
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[RAE-TM-AERO-2026] p 211 N86-17307
Application of a constrained inverse method in the aerodynamic design of a low speed wing-slat configuration
[NLR-TR-83123-U] p 211 N86-17320
Sound excitation during vortex-airfoil interaction
[MPIS-MITT-80] p 266 N86-18130
**AIRFRAME MATERIALS**
Research on high-strength aerospace aluminum alloys
p 244 A86-20037
Titanium Near Net Shape components for demanding airframe applications p 245 A86-21726
Current and potential usage of titanium castings for airframe applications p 246 A86-21753
**AIRFRAMES**
CAD/CAM designer - Jack of all trades
p 251 A86-21895
Airframe design to achieve minimum cost
p 267 A86-22141
Superplastically-formed/diffusion-bonded titanium technology transition case study p 252 A86-22142
**AIRLINE OPERATIONS**
Aviation maintenance management --- Book
p 197 A86-21055
General Aviation and Regional Air Traffic - Components of the Traffic System, Symposium, Friedrichshafen, West Germany, March 28, 29, 1985, Reports
p 197 A86-21325
Maintenance strategies for aero engines
p 253 A86-22384
**AIRPORT SECURITY**
Airport preparedness for mass disaster - A proposed schematic plan p 214 A86-20411
**AIRPORTS**
General Aviation and Regional Air Traffic - Components of the Traffic System, Symposium, Friedrichshafen, West Germany, March 28, 29, 1985, Reports
p 197 A86-21325
Evaluation of 23 inch radar viewing unit for Heathrow approach control room
[CAA-PAPER-85011] p 216 N86-16209
Report of the Working Group for Sensitivity Analysis and Zoning Calculations (GAZOB) p 259 N86-16749
Noise nuisance calculations for Schiphol Airport on behalf of the Sensitivity Analysis and Zoning Calculations Working Group (GAZOB)
[NLR-TR-85034-U] p 260 N86-16751
AFOS (Automation of Field Operations and Services) monitory of terminal forecasts
[PB85-236388] p 280 N86-16843
Noise reduction technology
[GPO-46-026] p 265 N86-17076
Noise assessment around Schiphol airport (the Netherlands) in 1981
[NLR-TR-82034-U] p 260 N86-17915
**AIRSHIPS**
Very large stationary aerial platforms
p 218 A86-19573
Non-rigid airship testing p 223 A86-21059
**ALGORITHMS**
Towards robust image matching algorithms
p 230 A86-19620
Comparison of performance characteristics of DDC algorithms implemented on a microprocessor --- Direct Digital Control p 263 A86-20518
Recursive instrumental variable algorithms for modal parameter estimation of structural system
p 263 A86-22306
An investigation of adaptive controllers for helicopter vibration and the development of a new dual controller
[NASA-CR-177377] p 239 N86-16228
Robust detection-isolation-accommodation for sensor failures
[NASA-CR-174797] p 255 N86-16486
Numerical analysis about flow over an aerofoil with a large angle of attack p 210 N86-17291
A sophisticated tracking algorithm for Air Traffic Control (ATC) surveillance radar data
[NLR-MP-84004-U] p 216 N86-17334
Comparison of a jump-diffusion tracker with a Kalman tracker: An evaluation with emphasis on air traffic control
[NLR-TR-83063-U] p 216 N86-17335
An efficient filter for abruptly changing systems
[NLR-MP-84071-U] p 264 N86-18056
**ALTITUDE SIMULATION**
Progress in the Lewis Research Center Altitude Wind Tunnel (AWT) Modeling Program
[NASA-TM-87194] p 242 N86-16233
**ALUMINUM ALLOYS**
Research on high-strength aerospace aluminum alloys
p 244 A86-20037
Cast aluminum fatigue property/microstructure relationships p 244 A86-21707
SPF aluminum - A first for the S-76B helicopter --- Superplastic Forming p 250 A86-21709
The material development, component manufacture, and post-service evaluation of RB211-524 cowl doors utilizing carbon fibre composite materials
[PNR-90275] p 247 N86-16273
Fatigue rated fastener systems in aluminum alloy structural joints --- aircraft structures
[NLR-MP-83045-U] p 259 N86-17809
**ANGLE OF ATTACK**
An experimental investigation of an airfoil pitching at moderate to high rates to large angles of attack
[AIAA PAPER 86-0008] p 198 A86-19631
Reflections regarding recent rotary rig results
[AIAA PAPER 86-0123] p 241 A86-19703
Experimental study of effects of forebody geometry on high angle of attack static and dynamic stability
[AIAA PAPER 86-0331] p 238 A86-19818
Exploratory investigation of deflectable forebody strakes for high angle of attack yaw control
[AIAA PAPER 86-0333] p 238 A86-19819
Supersonic aerodynamic characteristics of some reentry concepts for angles of attack to 90 deg
[NASA-TM-87645] p 243 N86-16243
Numerical analysis about flow over an aerofoil with a large angle of attack p 210 N86-17291
**ANNULAR NOZZLES**
An analytical investigation of the effects of swirler design on the performance of annular propulsive nozzles
[AIAA PAPER 86-0587] p 233 A86-19965
**ANTHROPOMETRY**
The state of the art of anthropomorphic manikins and requirements for the evaluation of advanced aircraft ejection systems p 262 A86-19345
**ANTIMISSILE DEFENSE**
The Adaptive Maneuvering Logic program in support of the pilot's associate program - A heuristic approach to missile evasion
[AIAA PAPER 86-0423] p 263 A86-19865
**ANTIMISTING FUELS**
Research on antimisting fuel for suppression of postcrash aircraft fires
[AIAA PAPER 86-0573] p 247 A86-22706
**APPROACH CONTROL**
Simulator evaluation of a remotely piloted vehicle visual landing task p 221 A86-20238
**ARCTIC REGIONS**
Operating experience in the Jeff (A) in the Arctic
[ASME PAPER 85-GT-127] p 266 A86-22076
**ARTIFICIAL INTELLIGENCE**
Development of a knowledge acquisition tool for an expert system flight status monitor
[AIAA PAPER 86-0240] p 230 A86-19764
Understanding natural language commands
p 263 A86-20867
Plessey displays in air traffic control
p 216 A86-21606
Coupling artificial intelligence and numerical computation for engineering design (Invited paper)
[AIAA PAPER 86-0242] p 254 A86-22684
**ASSESSMENTS**
Noise assessment around Schiphol airport (the Netherlands) in 1981
[NLR-TR-82034-U] p 260 N86-17915
**ASSURANCE**
AVIP Air Force thrust for reliability
p 256 N86-16617
Reliability aspects of software for digital avionics
[NLR-TR-82126-U] p 232 N86-17354
**ASTRONAUTICS**
Activities report in aircraft development and astronautics p 267 N86-17233
**ASYMMETRY**
Design of nonaxysymmetric structures (turbojet engine nacelle element)
[SNIAS-852-430-119] p 248 N86-17498
**ATMOSPHERIC TURBULENCE**
Spanwise turbulence effects on aircraft response
[AIAA PAPER 86-0255] p 200 A86-19774
Gust alleviation using combined control laws
p 239 A86-22317
Critical analysis of turbulence restitution from acceleration measurements --- aircraft construction
[ONERA-RT-3/3567-RY-C40-R] p 227 N86-17340
**ATOMIZERS**
Investigation of jet-filming airblast atomizer
[ASME PAPER 85-GT-185] p 252 A86-22099
Formation and characterization of simulated small droplet icing clouds
[AIAA PAPER 86-0409] p 254 A86-22700
**ATTACK AIRCRAFT**
Protective respirator for the AAH-64 Advanced Attack Helicopter p 261 A86-19336
AV-8B design for maintainability p 225 A86-22378
**ATTITUDE CONTROL**
Exploratory investigation of deflectable forebody strakes for high angle of attack yaw control
[AIAA PAPER 86-0333] p 238 A86-19819
**AUTOMATIC CONTROL**
Aircraft terminal area guidance based on the discrete tracking problem of optimal control theory
p 215 A86-20520
**AUTOMATIC CONTROL VALVES**
Development of an electro-pneumatic anti-G valve for high performance fighter aircraft p 218 A86-19317
**AUTOMATIC FLIGHT CONTROL**
Search and Rescue (SAR) System developed as part of the contract signed with the Irish Air Corps for the supply of 365 F Dauphin aircraft
[SNIAS-852-210-105] p 215 N86-17329
**AUTOMATION**
Computer tools and techniques for analysis of discrete data from aircrew automated escape systems (AAES)
p 260 A86-19302

**AUTOREGRESSIVE PROCESSES**
Recursive instrumental variable algorithms for modal parameter estimation of structural system
p 263 A86-22306

**AUTOROTATION**
Estimation of drag due to inoperative turbo-jet and turbo-fan engines using data item nos. 81009 and 84004
[ESDU-84005] p 211 N86-17305

**AUXILIARY POWER SOURCES**
Power dense gas turbine APUs
[ASME PAPER 85-GT-124] p 235 A86-22074

**AVAILABILITY**
Life cycle cost and availability in military aeronautics
p 266 A86-21872

**AVIONICS**
A new generation advanced I.R. Linescan Sensor system p 229 A86-19585
Implications of new aircraft avionics reliability performance p 253 A86-22178
Hardware/software FMEA applied to airplane safety
p 253 A86-22396
FINDS: A fault inferring nonlinear detection system programmers manual, version 3.0
[NASA-CR-177986] p 231 N86-16212
Stress level testing of electronics, avionics communications and C3I equipments
[AD-A159395] p 231 N86-16214
The Shock and Vibration Bulletin 55. Part 1: Welcome, keynote address, invited papers, isolation and damping and damping practices
[AD-A160263] p 256 N86-16616
AVIP Air Force thrust for reliability
p 256 N86-16617
A decade of reliability testing progress
p 256 N86-16619
CERT: Where we have been, where we are going
p 256 N86-16620
Error propagation in a digital avionic processor: A simulation-based study
[NASA-CR-176501] p 232 N86-17351
Development of a piezoelectric quartz pressure sensor for avionics with excellent long term stability (with final demonstration of the results on a prototype)
[BMFT-FB-W-85-010] p 232 N86-17353
Reliability aspects of software for digital avionics
[NLR-TR-82126-U] p 232 N86-17354

**AXIAL FLOW**
Transonic blade to blade calculations in an axial, radial or mixed flow cascade equipped with splitter blades
[ASME PAPER 85-GT-86] p 205 A86-22057
An eleven parameter axial turbine airfoil geometry model
[ASME PAPER 85-GT-219] p 205 A86-22117
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation
[AD-A159312] p 237 N86-16222

**AXIAL FLOW TURBINES**
Axial flow contra-rotating turbines
[ASME PAPER 85-GT-218] p 236 A86-22116

## B

**B-70 AIRCRAFT**
XB-70 structures and materials advancements
p 224 A86-22131

**BACKGROUND NOISE**
A new application of adaptive noise cancellation — in acoustic barriers p 262 A86-22626

**BACKWARD FACING STEPS**
Influence of excitation on coherent structures in reattaching turbulent shear layers
[AIAA PAPER 86-0112] p 199 A86-19696

**BEECHCRAFT AIRCRAFT**
Starship 1 p 225 A86-22133

**BLACK AND WHITE PHOTOGRAPHY**
Image processing of aerodynamic data
[NASA-TM-87629] p 255 N86-16553

**BLAST LOADS**
The Shock and Vibration Bulletin 55. Part 2: Dynamic testing, flight vehicle dynamics, seismic loads and fluid-structure interaction
[AD-A160264] p 257 N86-16646

**BLOWING**
Influence of wing tip configuration on lateral blowing efficiency
[AIAA PAPER 86-0475] p 206 A86-22702

**BLUFF BODIES**
Investigation of the aerodynamic forces on bluff bodies at high Reynolds numbers
[ESA-TT-914] p 209 N86-16206

**BO-105 HELICOPTER**
Construction of a measuring method using fiber optics and an LTN-90 laser gyro strapdown system for BO-195 helicopters
[DFVLR-MITT-85-10] p 216 N86-17333

**BODY-WING CONFIGURATIONS**
Geometry generation for transonic design
p 221 A86-20932
Transonic wind tunnel tests of a swept supercritical wing-body model, PT 8
[FFA-TN-1982-24] p 211 N86-17316

**BOEING AIRCRAFT**
Pressure distributions from high Reynolds number tests of a Boeing BAC 1 airfoil in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87600] p 208 N86-16199

**BOEING 727 AIRCRAFT**
Wind shear characterization
[AIAA PAPER 86-0180] p 213 A86-19737

**BOEING 747 AIRCRAFT**
An engineering simulation of the Boeing 747 primary flight control systems
[AIAA PAPER 86-0494] p 239 A86-19905

**BOMBS (ORDNANCE)**
Supersonic conventional weapon testing of the F/A-18A Hornet p 222 A86-21052

**BOOLEAN FUNCTIONS**
Multi-knot Boolean sum interpolating surface interactive design of aircraft configuration p 263 A86-22305

**BOUNDARY LAYER CONTROL**
Aircraft viscous drag reduction technology
p 204 A86-20124

**BOUNDARY LAYER SEPARATION**
Boundary layer calculations on the leeward surface of a slender delta wing at incidence
[NLR-TR-84001-U] p 258 N86-17700

**BOUNDARY LAYER TRANSITION**
A review and analysis of boundary layer transition data for turbine application
[ASME PAPER 85-GT-83] p 251 A86-22054

**BOUNDARY LAYERS**
Flow field survey near the rotational plane of an advanced design propeller on a JetStar airplane
[NASA-TM-86037] p 207 N86-16196
Investigation of the development of laminar boundary-layer instabilities along a sharp cone
[AD-A159370] p 255 N86-16521

**BOX BEAMS**
Design and fabrication of an advanced composite cellular wing box
[VTH-LR-315] p 227 N86-17344

**BUBBLES**
Measurements of rotating bubble shapes in low-gravity environment p 251 A86-21996

**BUFFETING**
Elimination of buffeting on the rear fuselage of the Hercules tanker p 221 A86-20822

**BULKHEADS**
CAD/CAM designer - Jack of all trades
p 251 A86-21895

**BUOYANCY**
How much inherant buoyancy is acceptable in a helicopter passenger immersion suit
p 261 A86-19310
The effect of water ingress on buoyancy and thermal quality of survival suits p 261 A86-19333
Dispersion process of jet engine exhaust plume. II - Buoyant jet p 234 A86-20448

**BUTT JOINTS**
Fatigue testing of tube to node butt welds envisaged for RAE Bedford flight simulator
[REPT-23480/2/85] p 257 N86-16674

## C

**C-130 AIRCRAFT**
Elimination of buffeting on the rear fuselage of the Hercules tanker p 221 A86-20822

**C-135 AIRCRAFT**
The KC-135/CFM56 Re-Engine Program
[ASME PAPER 85-GT-211] p 224 A86-22112

**C-141 AIRCRAFT**
Bigger is better - Stretching the C-141 Starlifter
p 220 A86-20125

**CALIBRATING**
German-Dutch wind tunnel (DNW). Present and future applications for industrial developments
p 242 N86-16235
A smoke generator for the absolute calibration of gas turbine engine smoke sampling and measuring systems
[RAE-TM-P-1044] p 258 N86-17702
Spectroradiometric calibration of the Thematic Mapper and multispectral scanner system
[E86-10022] p 260 N86-17816

**CAMBERED WINGS**
Summary of a high subsonic force/pressure experiment for 58 deg cambered/twisted thick delta wings
[AIAA PAPER 86-0169] p 200 A86-19730
Supersonic aerodynamic characteristics of some reentry concepts for angles of attack to 90 deg
[NASA-TM-87645] p 243 N86-18243

**CAMERAS**
The CA-810 - A modern tri-lens camera
p 228 A86-19577
PC-183B standoff imaging system
p 229 A86-19578
KA-102 film/EO standoff system p 229 A86-19581
KS-146A camera development and flight test results
p 229 A86-19583
Computer controlled operation of reconnaissance cameras p 229 A86-19587
Automatic exposure control employing scene statistics in reconnaissance cameras p 230 A86-19588
Camera flight tests and image evaluation
p 230 A86-19591
Description of and results from camera systems for recording daytime lightning strikes to an airplane in flight
[AIAA PAPER 84-0020] p 230 A86-19636

**CANARD CONFIGURATIONS**
Canard Mirage on test p 225 A86-22261

**CARBON FIBER REINFORCED PLASTICS**
Recent developments in carbon fibre composite
p 244 A86-21296
Problems found when introducing new materials — aircraft industry
[SNIAS-852-551-101] p 198 N86-16190
The material development, component manufacture, and post-service evaluation of RB211-524 cowl doors utilizing carbon fibre composite materials
[PNR-90275] p 247 N86-16273
The applications of composite materials in the aeronautical domain
[SNIAS-852-551-103] p 247 N86-16279
Design and fabrication of an advanced composite cellular wing box
[VTH-LR-315] p 227 N86-17344
Study of composite material curing molds
[DG1-26.817] p 248 N86-17486

**CASCADE FLOW**
Transonic blade to blade calculations in an axial, radial or mixed flow cascade equipped with splitter blades
[ASME PAPER 85-GT-86] p 205 A86-22057
Heat transfer measurements with film cooling on a turbine blade profile in cascade
[ASME PAPER 85-GT-117] p 251 A86-22070
Production and development of secondary flows and losses within a three dimensional turbine stator cascade
[ASME PAPER 85-GT-217] p 205 A86-22115
Transonic internal flow about an airfoil oscillating in pitch: Comparisons between computation and experiment
p 209 N86-17278

**CAST ALLOYS**
Cast aluminum fatigue property/microstructure relationships p 244 A86-21707
Current and potential usage of titanium castings for airframe applications p 246 A86-21753

**CATAPULTS**
Control law and logic development for controllable ejection seat catapult p 218 A86-19320
Controllable ejection seat catapult program
p 218 A86-19339

**CEILINGS (METEOROLOGY)**
AFOS (Automation of Field Operations and Services) monitory of terminal forecasts
[PB85-236388] p 260 N86-16843

**CENTRAL PROCESSING UNITS**
Error propagation in a digital avionic processor: A simulation-based study
[NASA-CR-176501] p 232 N86-17351

**CENTRIFUGAL COMPRESSORS**
Interdependence of centrifugal compressor blade geometry and relative flow field
[ASME PAPER 85-GT-85] p 251 A86-22056

**CENTRIFUGING**
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation
[AD-A159312] p 237 N86-16222

**CERAMIC COATINGS**
Strain isolated ceramic coatings for gas turbine engines
[ASME PAPER 85-GT-96] p 247 A86-22062

**CERAMICS**
Advances in P/M titanium shape technology using the ceramic mold process p 246 A86-21741

**CERTIFICATION**
The damage tolerance approach in the type approval process p 220 A86-20036
Certification of aeroengines fitted with full authority digital control
[PNR-90287] p 237 N86-16225
Is the traditional 150 hour endurance test outdated?
[PNR-90288] p 237 N86-16226

Hardware/software Failure Mode Effect Analysis (FMEA) applied to airplane safety [NLR-MP-84073-U] p 215 N86-17325
Reliability aspects of software for digital avionics [NLR-TR-82126-U] p 232 N86-17354

**CHANNELS (DATA TRANSMISSION)**
A high bandwidth signal distribution system for aircraft Stores Management Systems (SMS) p 231 A86-20505

**CHARGE COUPLED DEVICES**
Automatic exposure control employing scene statistics in reconnaissance cameras p 230 A86-19588
Development of an airborne CCD scanner for land and sea applications p 231 A86-21163

**CHEMICAL EQUILIBRIUM**
Flame temperature estimation of conventional and future jet fuels [ASME PAPER 85-GT-31] p 246 A86-22020

**CHORDS (GEOMETRY)**
Investigation of chord ratio, stagger, decalage angle, and flap angle for dual wing configurations [AIAA PAPER 86-0317] p 201 A86-19810

**CHROMIUM ALLOYS**
High strength nickel-palladium-chromium brazing alloys p 244 A86-20579

**CIRCUIT RELIABILITY**
AVIP Air Force thrust for reliability p 256 N86-16617

**CIRCULAR CONES**
Supersonic aerodynamic characteristics of some reentry concepts for angles of attack to 90 deg [NASA-TM-87645] p 243 N86-16243

**CIRCULATION CONTROL AIRFOILS**
Blended blown flaps and vectored thrust for low-speed flight [AIAA PAPER 84-2199] p 221 A86-20157

**CIVIL AVIATION**
A shared satellite system would satisfy many future aviation needs p 249 A86-20921
Aviation maintenance management --- Book p 197 A86-21055
General Aviation and Regional Air Traffic - Components of the Traffic System, Symposium, Friedrichshafen, West Germany, March 28, 29, 1985, Reports p 197 A86-21325
Maintenance strategies for aero engines p 253 A86-22384
Activities report in aeronautics p 198 N86-16189
Establishment and use of time unification system for civil aviation p 258 N86-17648

**CLASSIFICATIONS**
Air targeting of the third kind - Airborne vehicles p 230 A86-19617

**CLEAR AIR TURBULENCE**
An extreme clear air turbulence incidence associated with a strong downslope windstorm [AIAA PAPER 86-0329] p 259 A86-19816

**CLOCKS**
Establishment and use of time unification system for civil aviation p 258 N86-17648

**CLOUD HEIGHT INDICATORS**
AFOS (Automation of Field Operations and Services) monitory of terminal forecasts [PB85-236388] p 260 N86-16843

**CLOUDS**
Formation and characterization of simulated small droplet icing clouds [AIAA PAPER 86-0409] p 254 A86-22700

**CLOUDS (METEOROLOGY)**
AFOS (Automation of Field Operations and Services) monitory of terminal forecasts [PB85-236388] p 260 N86-16843

**COCKPITS**
Helicopter internal noise treatment. Recent methodolgies and practical applications [SNIAS-852-210-102] p 266 N86-18133

**COKE**
Long term deposit formation in aviation turbine fuel at elevated temperature [AIAA PAPER 86-0525] p 243 A86-19929

**COLD FLOW TESTS**
Cold flow and combustion experiments with a new burner air distribution concept [ASME PAPER 85-GT-40] p 235 A86-22029

**COLD WEATHER**
The Canadian forces twin Otter aircraft operations in the Arctic - A thermal assessment p 212 A86-19334

**COLD WEATHER TESTS**
Operating experience in the Jeff (A) in the Arctic [ASME PAPER 85-GT-127] p 266 A86-22076

**COLLISION AVOIDANCE**
Aircraft accident report: Midair collision of Wings West Airlines Beech C-99 (N666U) and Aesthetec Inc., Rockwell Commander (N112SM), near San Luis Obispo, California, August 24, 1984 [NTSB/AAR-85/07] p 214 N86-16207

**COLOR PHOTOGRAPHY**
Image processing of aerodynamic data [NASA-TM-87629] p 255 N86-16553

**COMBINED STRESS**
CERT: Where we have been, where we are going p 256 N86-16620

**COMBUSTION**
The two-fluid model of turbulent combustion applied to an idealised one-dimensional, unsteady, confined, pre-mixed flame [PDR/CFDU/IC/21] p 247 N86-16315

**COMBUSTION CHAMBERS**
The effect of acoustic reflections on combustor noise measurements p 265 A86-20364
Fuel property effects upon exhaust smoke and the weak extinction characteristics of the Pratt and Whitney PT6A-65 engine [ASME PAPER 85-GT-27] p 234 A86-22018
Design of combustor cooling slots for high film effectiveness. I - Film general development [ASME PAPER 85-GT-35] p 234 A86-22024
Design of combustor cooling slots for high film effectiveness. II - Film initial region [ASME PAPER 85-GT-36] p 234 A86-22025
The effect of fuel composition upon combustion performance in a Rolls Royce Tyne combustor [ASME PAPER 85-GT-39] p 234 A86-22028
Cold flow and combustion experiments with a new burner air distribution concept [ASME PAPER 85-GT-40] p 235 A86-22029
Full coverage discrete hole film cooling - The influence of hole size [ASME PAPER 85-GT-47] p 251 A86-22035
Evaluation of fuel preparation systems for lean premixing-prevaporizing combustors [ASME PAPER 85-GT-137] p 235 A86-22081

**COMBUSTION CHEMISTRY**
The effect of fuel composition upon combustion performance in a Rolls Royce Tyne combustor [ASME PAPER 85-GT-39] p 234 A86-22028

**COMMAND AND CONTROL**
Local area command/control networks: The design of an on-board network - ANTINEA --- French thesis p 215 A86-21327
Airborne communications reconstitution experiments p 251 A86-21891
Certification of aeroengines fitted with full authority digital control [PNR-90287] p 237 N86-16225

**COMMAND LANGUAGES**
Understanding natural language commands p 263 A86-20667

**COMMERCIAL AIRCRAFT**
Design of a twin-engine short-haul commuter aircraft for the 1990s [AIAA PAPER 86-0077] p 219 A86-19674
Wind shear characterization [AIAA PAPER 86-0180] p 213 A86-19737
SF-340 airfoil structure - A unique approach p 224 A86-21712
Is there life after 10,000 flight hours? p 254 A86-22402
Aerodynamic design trends for commercial aircraft [NASA-TM-77976] p 227 N86-17338
Critical analysis of turbulence restitution from acceleration measurements --- aircraft construction [ONERA-RT-3/3567-RY-C40-R] p 227 N86-17340

**COMMUNICATION NETWORKS**
Local area command/control networks: The design of an on-board network - ANTINEA --- French thesis p 215 A86-21327
Airborne communications reconstitution experiments p 251 A86-21891

**COMPARISON**
Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance: Preliminary results [NASA-TM-87637] p 265 N86-17077

**COMPONENT RELIABILITY**
The Shock and Vibration Bulletin 55. Part 1: Welcome, keynote address, invited papers, isolation and damping and damping practices [AD-A160263] p 256 N86-16616
A decade of reliability testing progress p 256 N86-16619

**COMPOSITE MATERIALS**
National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings p 244 A86-21701
Impact of composite materials on advanced fighters p 245 A86-21722
Composite fabrics in a thermal protection application p 245 A86-21734
Starship 1 p 225 A86-22133
Composites technology transfer and transition p 253 A86-22144
Nondestructive inspection: An efficient investment --- composite materials [SNIAS-852-430-110] p 247 N86-16276
Arenyl: A soluble mold technology [SNIAS-852-430-111] p 247 N86-16277
Composite materials: A source of innovation --- aircraft industry [SNIAS-852-430-113] p 248 N86-17493
Design of nonaxysymmetric structures (turbojet engine nacelle element) [SNIAS-852-430-119] p 248 N86-17498
Description of a nondestructive facility using holographic interferometry [SNIAS-852-430-105] p 258 N86-17726
Separation of airborne and structureborne noise radiated by plates constructed of conventional and composite materials with applications for prediction of interior noise paths in propeller driven aircraft [NASA-TM-87414] p 265 N86-18121

**COMPOSITE STRUCTURES**
Applications of tubular composite structures p 245 A86-21719
Impact of composite materials on advanced fighters p 245 A86-21722
Effect of manufacturing defects and service-induced damage on the strength of aircraft composite structures p 245 A86-21729
Improved temperature resistant sealants for composite & adhesive bonded fuel-tank structures p 246 A86-21736
Unique tooling and manufacturing approach for large advanced composite aircraft structure p 246 A86-21742

**COMPRESSIBLE FLOW**
The numerical solution of the compressible viscous flow field about a complete aircraft in flight p 205 A86-21033
Numerical solution of viscous compressible flows past an airfoil using unconditionally stable explicit method p 210 N86-17290
Numerical analysis of transonic flow around two-dimensional airfoil by solving Navier-Stokes equations p 210 N86-17292

**COMPRESSOR BLADES**
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation [AD-A159312] p 237 N86-16222

**COMPRESSOR ROTORS**
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation [AD-A159312] p 237 N86-16222

**COMPUTATION**
CERR: An aviation verification program [PB85-204824] p 260 N86-16854

**COMPUTATIONAL FLUID DYNAMICS**
Unsteady transonics of a wing with tip store [AIAA PAPER 86-0010] p 198 A86-19633
Numerical modeling of rotor flows with a conservative form of the full-potential equations [AIAA PAPER 86-0079] p 198 A86-19676
The computation of steady 3-D separated flows over aerodynamic bodies at incidence and yaw [AIAA PAPER 86-0109] p 199 A86-19693
Computation of dynamic stall of NACA0012 airfoil by block pentadiagonal matrix scheme [AIAA PAPER 86-0116] p 199 A86-19697
Fluid dynamics of cylinder response to Karman vortex shedding [AIAA PAPER 86-0119] p 199 A86-19700
Steady and unsteady full potential calculation for large and small aspect ratio supercritical wings [AIAA PAPER 86-0122] p 199 A86-19702
Unsteady three-dimensional simulations of a VTOL upwash fountain [AIAA PAPER 86-0212] p 200 A86-19753
Numerical simulation of impinging jets [AIAA PAPER 86-0279] p 200 A86-19789
Design of a natural laminar flow wing for a transonic corporate transport [AIAA PAPER 86-0314] p 200 A86-19807
Investigation of chord ratio, stagger, decalage angle, and flap angle for dual wing configurations [AIAA PAPER 86-0317] p 201 A86-19810
Evaluation of methods for predicting complex aircraft flowfields [AIAA PAPER 86-0396] p 201 A86-19855
Three-dimensional elliptic grid generation about fighter aircraft for zonal finite-difference computations [AIAA PAPER 86-0429] p 202 A86-19871
Conformal mapping as an aid in grid generation for complex three-dimensional configurations [AIAA PAPER 86-0497] p 203 A86-19908
Practical applications of new LU-ADI scheme for the three-dimensional Navier-Stokes computation of transonic viscous flows [AIAA PAPER 86-0513] p 203 A86-19922

Evolution and status of CFD techniques for scramjet applications
[AIAA PAPER 86-0160] p 248 A86-19970

The critical role of computational fluid dynamics in rotary-wing aerodynamics
[AIAA PAPER 86-0336] p 204 A86-19971

Modeling aerodynamic responses to aircraft maneuvers - A numerical validation p 204 A86-20156

Euler solvers as an analysis tool for aircraft aerodynamics p 204 A86-20939

A transonic rectangular grid embedded panel method
p 204 A86-20953

Computational methods in viscous flows
p 250 A86-21026

The numerical solution of the compressible viscous flow field about a complete aircraft in flight
p 205 A86-21033

A solution to the problem of flow past wings with allowance for flow separation on the basis of a system of Euler equations p 205 A86-21345

Transonic blade to blade calculations in an axial, radial or mixed flow cascade equipped with splitter blades
[ASME PAPER 85-GT-86] p 205 A86-22057

NASA Lewis Research Center/university graduate research program on engine structures
[ASME PAPER 85-GT-159] p 252 A86-22084

Calculation of external and internal transonic flow field of a three-dimensional shielded S-shaped inlet
p 205 A86-22303

A vortex lattice method for jet wing performance with nonlinear wake and tip flow p 205 A86-22311

Calculation of supersonic flows around a three-dimensional wing and a waisted body with characteristic method in stream surface coordinates
p 206 A86-22319

Coupling artificial intelligence and numerical computation for engineering design (Invited paper)
[AIAA PAPER 86-0242] p 254 A86-22684

Numerical issues in computing inviscid supersonic flow over conical delta wings
[AIAA PAPER 86-0440] p 206 A86-22701

Numerical simulation of transonic separated flows over low-aspect ratio wings
[AIAA PAPER 86-0508] p 206 A86-22704

Validation of viscous and inviscid computational methods for turbomachinery components
[NASA-TM-87193] p 207 N86-16194

Implicit finite-difference methods for the calculation of unsteady transonic potential flow around two-dimensional airfoils: A discussion
[NLR-MP-83063-U] p 208 N86-16202

Application of time-linearized methods of oscillating wings in transonic flow and flutter
[NLR-MP-84077-U] p 208 N86-16204

Calculations of transonic flows around single and multielement airfoils on a small computer
[REPT-84-48] p 208 N86-16205

Numerical simulation of the leading-edge separation vortex over delta wing p 209 N86-17271

Numerical simulation of unsteady flow around an airfoil by finite difference solution of Navier-Stokes equations
p 209 N86-17273

Transonic internal flow about an airfoil oscillating in pitch: Comparisons between computation and experiment
p 209 N86-17278

Validation and comparison with experiment of a high Reynolds number transonic flow airfoil analysis code NSFOIL p 210 N86-17294

The role of computational fluid dynamics in aeronautical engineering
[REPT-2] p 257 N86-17296

Application of computational aerodynamics to wing design p 226 N86-17297

A system for computer aided analysis and design of multielement airfoils: MAD
[NLR-TR-83136-U] p 212 N86-17321

A survey of numerical methods for the calculation of inviscid, possibly rotational Euler flows around aeronautical configurations
[NLR-TR-83130-U] p 258 N86-17699

Boundary layer calculations on the leeward surface of a slender delta wing at incidence
[NLR-TR-84001-U] p 258 N86-17700

**COMPUTATIONAL GRIDS**

Three-dimensional body-fitting grid system for a complete aircraft
[AIAA PAPER 86-0428] p 201 A86-19870

Three-dimensional elliptic grid generation about fighter aircraft for zonal finite-difference computations
[AIAA PAPER 86-0429] p 202 A86-19871

Conformal mapping as an aid in grid generation for complex three-dimensional configurations
[AIAA PAPER 86-0497] p 203 A86-19906

Geometry generation for transonic design
p 221 A86-20932

A transonic rectangular grid embedded panel method
p 204 A86-20953

The numerical solution of the compressible viscous flow field about a complete aircraft in flight
p 205 A86-21033

Numerical solution of 2-D thrust reversing and thrust vectoring nozzle
[AIAA PAPER 86-0203] p 254 A86-22681

Numerical issues in computing inviscid supersonic flow over conical delta wings
[AIAA PAPER 86-0440] p 206 A86-22701

A simulation of rotor-stator interaction using the Euler equations and patched grids
[NASA-TM-86821] p 264 N86-17014

**COMPUTER AIDED DESIGN**

Definition and verification of a complex aircraft for aerodynamic calculations
[AIAA PAPER 86-0431] p 202 A86-19873

CAD/CAM designer - Jack of all trades
p 251 A86-21895

3-D design of turbine airfoils
[ASME PAPER 85-GT-188] p 236 A86-22101

Coupling artificial intelligence and numerical computation for engineering design (Invited paper)
[AIAA PAPER 86-0242] p 254 A86-22684

Application of a constrained inverse method in the aerodynamic design of a low speed wing-slat configuration
[NLR-TR-83123-U] p 211 N86-17320

A system for computer aided analysis and design of multielement airfoils: MAD
[NLR-TR-83136-U] p 212 N86-17321

Optimization in design processes: An informatics point of view
[NLR-MP-84074-U] p 228 N86-17349

Computer Aided Design (CAD) at the National Aerospace Laboratory (Netherlands) with the accent on aircraft flight control systems
[NLR-MP-84032-U] p 264 N86-18030

Engineering Data Interactive Presentation and Analysis System (EDIPAS): A general approach to engineering data management and analysis applied to wind tunnel testing
[NLR-MP-83057-U] p 267 N86-18252

**COMPUTER AIDED MANUFACTURING**

Definition and verification of a complex aircraft for aerodynamic calculations
[AIAA PAPER 86-0431] p 202 A86-19873

Toward automated airframe assembly
p 197 A86-21894

CAD/CAM designer - Jack of all trades
p 251 A86-21895

**COMPUTER GRAPHICS**

Multi-knot Boolean sum interpolating surface interactive design of aircraft configuration p 263 A86-22305

Engineering Data Interactive Presentation and Analysis System (EDIPAS): A general approach to engineering data management and analysis applied to wind tunnel testing
[NLR-MP-83057-U] p 267 N86-18252

**COMPUTER NETWORKS**

Local area command/control networks: The design of an on-board network - ANTINEA --- French thesis
p 215 A86-21327

**COMPUTER PROGRAM INTEGRITY**

Reliability aspects of software for digital avionics
[NLR-TR-82126-U] p 232 N86-17354

**COMPUTER PROGRAMS**

A microprocessor sequencer for the advanced Navy ejection seat p 218 A86-19331

Development of a generalized escape system simulation computer program p 240 A86-19340

Numerical modeling of rotor flows with a conservative form of the full-potential equations
[AIAA PAPER 86-0079] p 198 A86-19676

Evaluation of methods for predicting complex aircraft flowfields
[AIAA PAPER 86-0396] p 201 A86-19855

The Adaptive Maneuvering Logic program in support of the pilot's associate program - A heuristic approach to missile evasion
[AIAA PAPER 86-0423] p 263 A86-19865

Basic aircraft performance — Book
p 224 A86-21306

Radars in air traffic control - A status report
p 216 A86-21607

Hardware/software FMEA applied to airplane safety
p 253 A86-22396

Validation of viscous and inviscid computational methods for turbomachinery components
[NASA-TM-87193] p 207 N86-16194

Maximum-likelihood estimation of parameters in linear systems from flight test data. A FORTRAN program
[ESA-TT-896] p 264 N86-16969

Validation and comparison with experiment of a high Reynolds number transonic flow airfoil analysis code NSFOIL p 210 N86-17294

The comparison of the transonic airfoil calculation by NSFOIL with the wind tunnel test data at high Reynolds number p 210 N86-17295

Application of computational aerodynamics to wing design p 226 N86-17297

The analysis of practical transonic swept wings with and without boundary layer effects p 211 N86-17300

**COMPUTER SYSTEMS PERFORMANCE**

Hardware/software Failure Mode Effect Analysis (FMEA) applied to airplane safety
[NLR-MP-84073-U] p 215 N86-17325

Reliability aspects of software for digital avionics
[NLR-TR-82126-U] p 232 N86-17354

**COMPUTER TECHNIQUES**

Automatic exposure control employing scene statistics in reconnaissance cameras p 230 A86-19588

Development of a knowledge acquisition tool for an expert system flight status monitor
[NASA-TM-86802] p 263 N86-16944

**COMPUTERIZED SIMULATION**

Wind shear characterization
[AIAA PAPER 86-0180] p 213 A86-19737

Unsteady three-dimensional simulations of a VTOL upwash fountain
[AIAA PAPER 86-0212] p 200 A86-19753

The Adaptive Maneuvering Logic program in support of the pilot's associate program - A heuristic approach to missile evasion
[AIAA PAPER 86-0423] p 263 A86-19865

An engineering simulation of the Boeing 747 primary flight control systems
[AIAA PAPER 86-0494] p 239 A86-19905

Facility for closed loop testing of aircraft control systems p 241 A86-22188

Support effectiveness evaluation model --- for military air facilities in sortie generation p 263 A86-22398

A FORTRAN program for the determination of unsteady airforces on general combinations of interfering lifting surfaces oscillating in subsonic flow
[ARL-STRUCT-R-412] p 206 N86-16191

A simulation of rotor-stator interaction using the Euler equations and patched grids
[NASA-TM-86821] p 264 N86-17014

Error propagation in a digital avionic processor: A simulation-based study
[NASA-CR-176501] p 232 N86-17351

**CONFERENCES**

SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings
p 212 A86-19301

Airborne reconnaissance VIII; Proceedings of the Meeting, San Diego, CA, August 21, 22, 1984
[SPIE-496] p 228 A86-19576

Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-29, 1984, Proceedings
p 221 A86-21051

General Aviation and Regional Air Traffic - Components of the Traffic System, Symposium, Friedrichshafen, West Germany, March 28, 29, 1985, Reports
p 197 A86-21325

National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings
p 244 A86-21701

Symposium Gyro Technology 1984; Proceedings of the Symposium, Universitaet Stuttgart, West Germany, September 11, 12, 1984 p 250 A86-21826

Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings p 197 A86-22128

The Shock and Vibration Bulletin 55. Part 2: Dynamic testing, flight vehicle dynamics, seismic loads and fluid-structure interaction
[AD-A160264] p 257 N86-16646

**CONFIGURATION INTERACTION**

A simulation of rotor-stator interaction using the Euler equations and patched grids
[NASA-TM-86821] p 264 N86-17014

**CONFORMAL MAPPING**

Conformal mapping as an aid in grid generation for complex three-dimensional configurations
[AIAA PAPER 86-0497] p 203 A86-19906

**CONGRESSIONAL REPORTS**

Noise reduction technology
[GPO-48-026] p 265 N86-17076

Controlled Impact Demonstration (CID)
[GPO-46-870] p 214 N86-17324

**CONICAL BODIES**

Numerical issues in computing inviscid supersonic flow over conical delta wings
[AIAA PAPER 86-0440] p 206 A86-22701

Investigation of the development of laminar boundary-layer instabilities along a sharp cone
[AD-A159370] p 255 N86-16521

**CONTRAROTATING PROPELLERS**
A numerical method for the design and analysis of counter-rotating propellers
[AIAA PAPER 84-1205] p 233 A86-20369

**CONTROL CONFIGURED VEHICLES**
Dynamics and controls flight testing of the X-29A airplane
[AIAA PAPER 86-0167] p 237 A86-19728
Control of a forward-swept-wing configuration dominated by flight dynamic/aeroelastic interactions
p 239 A86-20237

**CONTROL EQUIPMENT**
Simulation of a six degrees of freedom flight simulator motion system
[UA-00-39] p 241 N86-16230

**CONTROL SURFACES**
Design of an active flutter suppression system
p 239 A86-20236
Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187
Application of computational aerodynamics to wing design p 226 N86-17297

**CONTROL SYSTEMS DESIGN**
A microprocessor sequencer for the advanced Navy ejection seat p 218 A86-19331
Comparison of performance characteristics of DDC algorithms implemented on a microprocessor --- Direct Digital Control p 263 A86-20518
Multivariable control
[OUEL-1589/85] p 264 N86-17007
Development of a sensitivity analysis technique for multiloop flight control systems
[NASA-CR-166619] p 240 N86-17358
Computer Aided Design (CAD) at the National Aerospace Laboratory (Netherlands) with the accent on aircraft flight control systems
[NLR-MP-84032-U] p 264 N86-18030

**CONTROL THEORY**
Control law and logic development for controllable ejection seat catapult p 218 A86-19320
Control methodology for stochastic system characteristics modulation
[AIAA PAPER 86-0335] p 262 A86-19821
Gust alleviation using combined control laws
p 239 A86-22317
Multivariable control
[OUEL-1589/85] p 264 N86-17007

**CONTROLLABILITY**
Flight stability and controllability. II - Aircraft longitudinal stability --- Serbo-Croation book p 239 A86-21318

**CONTROLLERS**
Development of a sensitivity analysis technique for multiloop flight control systems
[NASA-CR-166619] p 240 N86-17358

**COOLING**
The technical development of cooled gas turbine blades
[PNR-90292] p 255 N86-16595

**CORROSION PREVENTION**
AGARD Corrosion Handbook. Volume 1: Corrosion, causes and case histories
[AGARD-AG-278-VOL-1] p 248 N86-16374

**CORROSION TESTS**
AGARD Corrosion Handbook. Volume 1: Corrosion, causes and case histories
[AGARD-AG-278-VOL-1] p 248 N86-16374

**COST ANALYSIS**
Small propulsion engine LCC considerations
p 267 A86-22399
Noise assessment around Schiphol airport (the Netherlands) in 1981
[NLR-TR-82034-U] p 260 N86-17915

**COST EFFECTIVENESS**
Assessing cost-effective weight saving in aircraft operations p 220 A86-20039
Radars in air traffic control - A status report
p 216 A86-21607
The F-16 Common Engine Bay
[ASME PAPER 85-GT-231] p 224 A86-22127
The Air Force approach to environmental stress screening p 253 A86-22192

**COST REDUCTION**
Airframe design to achieve minimum cost
p 267 A86-22141
Superplastically-formed/diffusion-bonded titanium technology transition case study p 252 A86-22142

**COUNTER ROTATION**
Axial flow contra-rotating turbines
[ASME PAPER 85-GT-218] p 236 A86-22116

**COUPLING**
Effect of dynamic stall and elastic parameters on the fundamental mechanisms of helicopter vibrations
[AD-A160022] p 237 N86-17355

**CRACK INITIATION**
Fatigue life prediction under complex load using local strain approach and relative Miner's rule
p 249 A86-20173

**CRACK TIPS**
Measurement of elastic-plastic strain field at the curve surface crack tip p 249 A86-20175

**CRACKING (FRACTURING)**
Passive damping, sonic fatigue and the KC-135A
p 256 N86-16625

**CRASH LANDING**
Controlled Impact Demonstration (CID)
[GPO-46-870] p 214 N86-17324

**CRASHES**
Aircraft accident report: Midair collision of Wings West Airlines Beech C-99 (N666U) and Aesthetec Inc., Rockwell Commander (N112SM), near San Luis Obispo, California, August 24, 1984
[NTSB/AAR-85/07] p 214 N86-16207

**CRASHWORTHINESS**
The continuing requirement for helicopter escape
p 217 A86-19308
Controlled Impact Demonstration (CID)
[GPO-46-870] p 214 N86-17324

**CRIME**
United States Coast Guard acquisition of remote sensing capability for ocean surveillance p 231 A86-21234

**CROSS FLOW**
Dual rectangular jets from a flat plate in a crossflow
[AIAA PAPER 86-0477] p 255 A86-22703

**CRYOGENIC WIND TUNNELS**
Pressure distributions from high Reynolds number tests of a Boeing BAC 1 airfoil in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87600] p 208 N86-16199

**CUMULATIVE DAMAGE**
Fatigue life prediction under complex load using local strain approach and relative Miner's rule
p 249 A86-20173

**CURING**
Study of composite material curing molds
[DGT-26.817] p 248 N86-17486

**CYLINDRICAL BODIES**
Fluid dynamics of cylinder response to Karman vortex shedding
[AIAA PAPER 86-0119] p 199 A86-19700

## D

**DAMAGE**
The damage tolerance approach in the type approval process p 220 A86-20036

**DAMAGE ASSESSMENT**
Thermographic inspection of carbon epoxy structures
p 249 A86-20649

**DAMPING**
Passive damping, sonic fatigue and the KC-135A
p 256 N86-16625
A different approach to designed in passive damping
p 256 N86-16627

**DAST PROGRAM**
Design of an active flutter suppression system
p 239 A86-20236

**DATA ACQUISITION**
Limb Restraint Evaluator (LRE) p 261 A86-19329

**DATA BASE MANAGEMENT SYSTEMS**
Using a menu-based natural language interface to ask spatial database queries p 259 A86-20665
Engineering Data Interactive Presentation and Analysis System (EDIPAS): A general approach to engineering data management and analysis applied to wind tunnel testing
[NLR-MP-83057-U] p 267 N86-18252

**DATA BASES**
Critical analysis of turbulence restitution from acceleration measurements --- aircraft construction
[ONERA-RT-3/3567-RY-C40-R] p 227 N86-17340

**DATA RECORDERS**
Limb Restraint Evaluator (LRE) p 261 A86-19329

**DATA TRANSMISSION**
German-Dutch wind tunnel (DNW). Present and future applications for industrial developments
p 242 N86-16235

**DECISION THEORY**
Markov jump-diffusion models and decision-making free filtering --- air traffic control
[NLR-MP-83067-U] p 264 N86-17046

**DEFECTS**
Effect of manufacturing defects and service-induced damage on the strength of aircraft composite structures
p 245 A86-21729

**DEGREES OF FREEDOM**
Six degree of freedom simulation of fluid payload projectiles using numerically computed fluid moments
[DE85-017183] p 208 N86-16200

**DEICERS**
The electrodynamic operation of electro-impulse deicing systems
[AIAA PAPER 86-0547] p 220 A86-19941
The deiced super Puma --- helicopters
[SNIAS-852-210-104] p 215 N86-17328

**DEICING**
Designing an electro-impulse de-icing system
[AIAA PAPER 86-0545] p 220 A86-19940

**DELAMINATING**
Delamination threshold and loading effect in fiber glass epoxy composite p 244 A86-20636

**DELTA WINGS**
Summary of a high subsonic force/pressure experiment for 58 deg cambered/twisted thick delta wings
[AIAA PAPER 86-0169] p 200 A86-19730
An evaluation of leading-edge flap performance on delta and double-delta wings at supersonic speeds
[AIAA PAPER 86-0315] p 201 A86-19808
Visualization and flow surveys of the leading edge vortex structure on delta wing planforms
[AIAA PAPER 86-0330] p 201 A86-19817
Comparison of computations and experimental data for leading edge vortices - Effects of yaw and vortex flaps
[AIAA PAPER 86-0439] p 202 A86-19880
Modeling aerodynamic responses to aircraft maneuvers - A numerical validation p 204 A86-20156
A solution to the problem of flow past wings with allowance for flow separation on the basis of a system of Euler equations p 205 A86-21345
Calculation of supersonic flows around a three-dimensional wing and a waisted body with characteristic method in stream surface coordinates
p 206 A86-22319
Numerical issues in computing inviscid supersonic flow over conical delta wings
[AIAA PAPER 86-0440] p 206 A86-22701
Supersonic aerodynamic characteristics of some reentry concepts for angles of attack to 90 deg
[NASA-TM-87645] p 243 N86-16243
Numerical simulation of the leading-edge separation vortex over delta wing p 209 N86-17271
Boundary layer calculations on the leeward surface of a slender delta wing at incidence
[NLR-TR-84001-U] p 258 N86-17700

**DEPLOYMENT**
Introduction to deployable recovery systems
[DE86-000048] p 211 N86-17310

**DEPOSITS**
Long term deposit formation in aviation turbine fuel at elevated temperature
[AIAA PAPER 86-0525] p 243 A86-19929

**DESIGN ANALYSIS**
Controllable ejection seat catapult program
p 218 A86-19339
Compensating-slit canopy design - A new low-speed/high-speed parachute p 213 A86-19353
Very large stationary aerial platforms
p 218 A86-19573
The CA-810 - A modern tri-lens camera
p 228 A86-19577
KS-146A camera development and flight test results
p 229 A86-19583
Application of Kevlar to parachute system design
p 214 A86-20166
A redundant strapdown reference for advanced aircraft flight control systems p 239 A86-21840
Design of combustor cooling slots for high film effectiveness. I - Film general development
[ASME PAPER 85-GT-35] p 234 A86-22024
Development of a design model for airfoil leading edge film cooling
[ASME PAPER 85-GT-120] p 252 A86-22073
Axial flow contra-rotating turbines
[ASME PAPER 85-GT-218] p 236 A86-22116
An eleven parameter axial turbine airfoil geometry model
[ASME PAPER 85-GT-219] p 205 A86-22117
Aircraft design - From the myth of make-do to Mach 3
p 267 A86-22130
Velocity and temperature decay characteristics of inverted-profile jets
[AIAA PAPER 86-0312] p 206 A86-22693
Flow field survey near the rotational plane of an advanced design propeller on a JetStar airplane
[NASA-TM-86037] p 207 N86-16196
Mach number and flow-field calibration at the advanced design propeller location on the JetStar airplane
[NASA-TM-84923] p 207 N86-16197
The mechanical design of gas turbine blading in cast superalloys
[PNR-90247] p 237 N86-16223
Helicopter internal noise treatment. Recent methodolgies and practical applications
[SNIAS-852-210-102] p 266 N86-18133

DESIGN TO COST
Airframe design to achieve minimum cost
p 267 A86-22141
DETECTION
FINDS: A fault inferring nonlinear detection system programmers manual, version 3.0
[NASA-CR-177986] p 231 N86-16212
Robust detection-isolation-accommodation for sensor failures
[NASA-CR-174797] p 255 N86-16486
DIFFERENCES
Numerical analysis for steady transonic flows past an airfoil using AF scheme p 209 N86-17289
DIFFUSERS
An improved simple method for designing optimum annular diffusers
[ASME PAPER 85-GT-126] p 235 A86-22075
Simulation of diffuser duct flowfields using a three-dimensional Euler/Navier-Stokes algorithm
[AIAA PAPER 86-0310] p 206 A86-22692
DIFFUSION WELDING
Superplastically-formed/diffusion-bonded titanium technology transition case study p 252 A86-22142
DIGITAL DATA
Sensor control and film annotation for long range, standoff reconnaissance p 230 A86-19597
DIGITAL SYSTEMS
Certification of aeroengines fitted with full authority digital control
[PNR-90287] p 237 N86-16225
Error propagation in a digital avionic processor: A simulation-based study
[NASA-CR-176501] p 232 N86-17351
DIGITAL TECHNIQUES
Image processing of aerodynamic data
[NASA-TM-87629] p 255 N86-16553
DIRECTIONAL STABILITY
Yaw stabilization of an open ejection seat, fact or fantasy? p 217 A86-19305
DISASTERS
Airport preparedness for mass disaster - A proposed schematic plan p 214 A86-20411
DISPERSING
Dispersion process of jet engine exhaust plume. II - Buoyant jet p 234 A86-20448
DISPLAY DEVICES
Simulator evaluation of a remotely piloted vehicle visual landing task p 221 A86-20238
Evolution of the air traffic control beacon system
p 215 A86-21606
Plessey displays in air traffic control
p 216 A86-21608
DISTRIBUTED PROCESSING
Local area command/control networks: The design of an on-board network - ANTINEA --- French thesis
p 215 A86-21327
DIVERGENCE
Estimation of divergence and flutter boundaries on supersonic plate wing models from subcritical random responses due to air turbulence
[NAL-TR-856] p 211 N86-17308
DOCUMENTATION
Air and space flight. Dream and facts
[MBB-FILM-382] p 198 N86-16188
DOWNWASH
A numerical solution of the downwash associated with a blown-flap system
[AIAA PAPER 86-0473] p 202 A86-19892
DRAG REDUCTION
Shaping of airplane fuselages for minimum drag
[AIAA PAPER 86-0316] p 201 A86-19809
Aircraft viscous drag reduction technology
p 204 A86-20124
DROP SIZE
Study of ice accretion on icing wind tunnel components
[NASA-TM-87095] p 242 N86-16232
DROP TOWERS
The new 'dual stage' test procedure for low cost measurement of parachute performance
p 240 A86-19324
DROP TRANSFER
Quantitative determination of engine water ingestion
[AIAA PAPER 86-0307] p 254 A86-22690
DROPS (LIQUIDS)
Formation and characterization of simulated small droplet icing clouds
[AIAA PAPER 86-0409] p 254 A86-22700
DUAL WING CONFIGURATIONS
Investigation of chord ratio, stagger, decalage angle, and flap angle for dual wing configurations
[AIAA PAPER 86-0317] p 201 A86-19810
DUCTED FLOW
Simulation of diffuser duct flowfields using a three-dimensional Euler/Navier-Stokes algorithm
[AIAA PAPER 86-0310] p 206 A86-22692
DUMMIES
Limb Restraint Evaluator (LRE) p 261 A86-19329
The state of the art of anthropomorphic manikins and requirements for the evaluation of advanced aircraft ejection systems p 262 A86-19345
DURABILITY
Impact of composite materials on advanced fighters
p 245 A86-21722
DYNAMIC CHARACTERISTICS
Requirements for tailoring of material properties of viscoelastically damped bonded laminates in aircraft structures p 250 A86-21714
DYNAMIC MODELS
Effect of dynamic stall and elastic parameters on the fundamental mechanisms of helicopter vibrations
[AD-A160022] p 237 N86-17355
DYNAMIC STRUCTURAL ANALYSIS
A new method of analyzing wave propagation in periodic structures - Applications to periodic Timoshenko beams and stiffened plates p 249 A86-20792
Dynamic analysis of complex composite rotor systems with substructure transfer matrix method
[ASME PAPER 85-GT-74] p 235 A86-22049
Developing concepts in the rotordynamic analysis of aero gas turbines
[ASME PAPER 85-GT-230] p 236 A86-22126
The Shock and Vibration Bulletin 55. Part 1: Welcome, keynote address, invited papers, isolation and damping and damping practices
[AD-A160263] p 256 N86-16616
Dynamics R and D in the AFWAL Structures and Dynamics Division p 256 N86-16618
DYNAMIC TESTS
An engineering simulation of the Boeing 747 primary flight control systems
[AIAA PAPER 86-0494] p 239 A86-19905
The Shock and Vibration Bulletin 55. Part 2: Dynamic testing, flight vehicle dynamics, seismic loads and fluid-structure interaction
[AD-A160264] p 257 N86-16646
DYNAMICAL SYSTEMS
Dynamics R and D in the AFWAL Structures and Dynamics Division p 256 N86-16618

E

E-2 AIRCRAFT
T56 derivative engine in the improved E-2C
[ASME PAPER 85-GT-176] p 236 A86-22092
EAR PROTECTORS
Application of active noise reduction for hearing protection and speech intelligibility improvement
[IZF-1985-7] p 266 N86-18131
EARLY WARNING SYSTEMS
T56 derivative engine in the improved E-2C
[ASME PAPER 85-GT-176] p 236 A86-22092
EDUCATION
NASA Lewis Research Center/university graduate research program on engine structures
[ASME PAPER 85-GT-159] p 252 A86-22084
EJECTION SEATS
A Single Point Release System for the Advanced Concept Ejection Seat (ACES) II - Survival kit and parachute risers p 217 A86-19303
Yaw stabilization of an open ejection seat, fact or fantasy? p 217 A86-19305
Aircrew escape system models used in wind tunnel tests p 217 A86-19316
Vectored thrust digital control of ejection seats
p 218 A86-19318
Control law and logic development for controllable ejection seat catapult p 218 A86-19320
Limb Restraint Evaluator (LRE) p 261 A86-19329
A microprocesor sequencer for the advanced Navy ejection seat p 218 A86-19331
A philosophical basis for the use of high-performance, gliding parachutes in ejection seat aircraft
p 213 A86-19352
EJECTORS
Analysis of interacting dual lifting ejector systems
[AIAA PAPER 86-0478] p 233 A86-19895
ELASTOMERS
Optically transparent silicone elastomers
p 244 A86-21710
ELASTOPLASTICITY
Measurement of elastic-plastic strain field at the curve surface crack tip p 249 A86-20175
ELECTRIC FIELD STRENGTH
The lightning threat to aerospace vehicles
p 214 A86-20162
ELECTRIC PULSES
Designing an electro-impulse de-icing system
[AIAA PAPER 86-0545] p 220 A86-19940
The electrodynamic operation of electro-impulse deicing systems
[AIAA PAPER 86-0547] p 220 A86-19941
ELECTRICAL MEASUREMENT
The lightning threat to aerospace vehicles
p 214 A86-20162
ELECTRICAL RESISTIVITY
Feasibility study of a device to control aircraft electromagnetic protection --- transparence
[ONERA-RS-10/3466-PY] p 257 N86-17637
ELECTRO-OPTICS
KA-102 film/EO standoff system p 229 A86-19581
KS-146A camera development and flight test results
p 229 A86-19583
Evolution of real time airborne reconnaissance
p 229 A86-19586
Computer controlled operation of reconnaissance cameras p 229 A86-19587
Sensor control and film annotation for long range, standoff reconnaissance p 230 A86-19597
ELECTRODEPOSITION
Electrodeposited primer scale-up and qualification
p 245 A86-21735
ELECTROMAGNETIC ABSORPTION
Feasibility study of a device to control aircraft electromagnetic protection --- transparence
[ONERA-RS-10/3466-PY] p 257 N86-17637
ELECTROMAGNETIC INTERFERENCE
Feasibility study of a device to control aircraft electromagnetic protection --- transparence
[ONERA-RS-10/3466-PY] p 257 N86-17637
ELECTROMAGNETIC MEASUREMENT
Feasibility study of a device to control aircraft electromagnetic protection --- transparence
[ONERA-RS-10/3466-PY] p 257 N86-17637
ELECTROMAGNETIC RADIATION
Comparison of calculated and measured height profiles of transverse electric VLF signals across the daytime earth-ionosphere waveguide p 250 A86-21513
ELECTRONIC AIRCRAFT
Sensor control and film annotation for long range, standoff reconnaissance p 230 A86-19597
ELECTRONIC EQUIPMENT
The CA-810 - A modern tri-lens camera
p 228 A86-19577
Stress level testing of electronics, avionics communications and C3I equipments
[AD-A159395] p 231 N86-16214
ELECTRONIC EQUIPMENT TESTS
AVIP Air Force thrust for reliability
p 256 N86-16617
A decade of reliability testing progress
p 256 N86-16619
The application of sensors in light tests
[NLR-MP-84056-U] p 232 N86-17352
ELLIPTICITY
Vortex roll-up for an elliptically-loaded wing at moderately low Reynolds numbers
[AIAA PAPER 86-0562] p 203 A86-19951
ENERGY DISSIPATION
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation
[AD-A159312] p 237 N86-16222
ENERGY TRANSFER
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation
[AD-A159312] p 237 N86-16222
ENGINE AIRFRAME INTEGRATION
Aerodynamic characteristics of a high-wing transport configuration with a over-the-wing nacelle-pylon arrangement
[NASA-TP-2497] p 207 N86-16193
ENGINE CONTROL
'Smart' engine components - A micro in every blade?
p 234 A86-21896
ENGINE COOLANTS
Inverse design of coolant flow passage shapes with partially fixed internal geometries
[ASME PAPER 85-GT-118] p 252 A86-22071
ENGINE DESIGN
Lubrication and performance of high-speed rolling-element bearings p 248 A86-19375
An analytical investigation of the effects of swirler design on the performance of annular propulsive nozzles
[AIAA PAPER 86-0587] p 233 A86-19965
Linear-quadratic Gaussian with loop-transfer recovery methodology for the F-100 engine p 233 A86-20233
Variable cyclic turboshaft technology for rotorcraft of the '90s p 233 A86-20371
'Smart' engine components - A micro in every blade?
p 234 A86-21896
Design of combustor cooling slots for high film effectiveness. II - Film initial region
[ASME PAPER 85-GT-36] p 234 A86-22025
Power dense gas turbine APUs
[ASME PAPER 85-GT-124] p 235 A86-22074

An improved simple method for designing optimum annular diffusers
[ASME PAPER 85-GT-126] p 235 A86-22075

Evaluation of fuel preparation systems for lean premixing-prevaporizing combustors
[ASME PAPER 85-GT-137] p 235 A86-22061

Re-engining the Harrier
[ASME PAPER 85-GT-175] p 235 A86-22091

T56 derivative engine in the improved E-2C
[ASME PAPER 85-GT-176] p 236 A86-22092

F-14 re-engining with the F110 engine
[ASME PAPER 85-GT-184] p 224 A86-22098

The KC-135/CFM56 Re-Engine Program
[ASME PAPER 85-GT-211] p 224 A86-22112

Developing concepts in the rotordynamic analysis of aero gas turbines
[ASME PAPER 85-GT-230] p 236 A86-22126

The evolution of reciprocating engines at Lycoming
p 267 A86-22135

Evolution of the turbofan aircraft engine
p 236 A86-22136

The little turbine business p 236 A86-22200

Liquid fueled supersonic combustion ramjets - A research perspective of the past, present and future
[AIAA PAPER 86-0158] p 236 A86-22679

**ENGINE FAILURE**

F-14A low altitude, low airspeed, high angle of attack asymmetric thrust flight test program
p 222 A86-21053

Estimation of drag due to inoperative turbo-jet and turbo-fan engines using data item nos. 81009 and 84004
[ESDU-84005] p 211 N86-17305

**ENGINE INLETS**

The electrodynamic operation of electro-impulse deicing systems
[AIAA PAPER 86-0547] p 220 A86-19941

**ENGINE NOISE**

The effect of acoustic reflections on combustor noise measurements p 265 A86-20364

Passive damping, sonic fatigue and the KC-135A
p 256 N86-16625

**ENGINE PARTS**

'Smart' engine components - A micro in every blade?
p 234 A86-21896

Strain isolated ceramic coatings for gas turbine engines
[ASME PAPER 85-GT-96] p 247 A86-22062

**ENGINE STARTERS**

Synchronizing characteristics of a large variable frequency starting system p 249 A86-20516

Power dense gas turbine APUs
[ASME PAPER 85-GT-124] p 235 A86-22074

**ENGINE TESTING LABORATORIES**

Synchronizing characteristics of a large variable frequency starting system p 249 A86-20516

**ENGINE TESTS**

Is the traditional 150 hour endurance test outdated?
[PNR-90288] p 237 N86-16226

**ENTRAINMENT**

An experimental investigation of the entrainment into a leading-edge vortex
[VTH-LR-332] p 208 N86-16203

**ENVIRONMENT PROTECTION**

Environment-friendly propeller aircraft with a maximum weight of 5700 kg, and motor gliders: Publication of the noise values p 227 N86-17341

**ENVIRONMENT SIMULATION**

Numerical simulation of the transonic flowfield for wing/nacelle configurations p 204 A86-20159

Simulation and analysis of natural rain in a wind tunnel via digital image processing techniques
[AIAA PAPER 86-0291] p 241 A86-22687

Certification of aeroengines fitted with full authority digital control
[PNR-90287] p 237 N86-16225

**ENVIRONMENTAL TESTS**

Implications of new aircraft avionics reliability performance p 253 A86-22178

CERT: Where we have been, where we are going
p 256 N86-16620

**EPOXY RESINS**

Delamination threshold and loading effect in fiber glass epoxy composite p 244 A86-20636

**EQUATIONS OF MOTION**

Six degree of freedom simulation of fluid payload projectiles using numerically computed fluid moments
[DE85-017183] p 208 N86-16200

**EQUIPMENT SPECIFICATIONS**

The application of sensors in light tests
[NLR-MP-84056-U] p 232 N86-17352

**ERROR ANALYSIS**

Calculation of misalignment error of multi-joint holes of wing to fuselage p 253 A86-22318

Critical analysis of turbulence restitution from acceleration measurements --- aircraft construction
[ONERA-RT-3/3567-RY-C40-R] p 227 N86-17340

Error propagation in a digital avionic processor: A simulation-based study
[NASA-CR-176501] p 232 N86-17351

**ESCAPE SYSTEMS**

SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings
p 212 A86-19301

Computer tools and techniques for analysis of discrete data from aircrew automated escape systems (AAES)
p 260 A86-19302

The future of advanced crew escape capsule technology p 217 A86-19306

The continuing requirement for helicopter escape
p 217 A86-19308

U.S. Navy ALSS corporate report 1984
p 261 A86-19309

F-111 escape systems - Today's module technology
p 217 A86-19311

A scientific method for determining the useful life of explosive devices in aircraft p 243 A86-19312

The use of TLX energy transfer lines on the F-16 aircraft --- Thin Layer eXplosive p 243 A86-19313

Aircrew escape system models used in wind tunnel tests p 217 A86-19316

Vectored thrust digital control of ejection seats
p 218 A86-19318

Ballistically deployed parachute systems for single and two place aircraft p 212 A86-19319

Using Fleet reported 3-M data in support of Navy emergency escape parachute assemblies
p 212 A86-19326

Ballistic gas fired devices p 240 A86-19328

Development of a generalized escape system simulation computer program p 240 A86-19340

The state of the art of anthropomorphic manikins and requirements for the evaluation of advanced aircraft ejection systems p 262 A86-19345

Approach for service life extension of explosive devices for aircraft escape systems p 243 A86-19349

A philosophical basis for the use of high-performance, gliding parachutes in ejection seat aircraft
p 213 A86-19352

Escape systems testing p 223 A86-21063

**ESTIMATES**

Estimation of divergence and flutter boundaries on supersonic plate wing models from subcritical random responses due to air turbulence
[NAL-TR-856] p 211 N86-17308

**EULER EQUATIONS OF MOTION**

Euler solvers as an analysis tool for aircraft aerodynamics p 204 A86-20939

A solution to the problem of flow past wings with allowance for flow separation on the basis of a system of Euler equations p 205 A86-21345

Simulation of diffuser duct flowfields using a three-dimensional Euler/Navier-Stokes algorithm
[AIAA PAPER 86-0310] p 206 A86-22692

A simulation of rotor-stator interaction using the Euler equations and patched grids
[NASA-TM-86821] p 264 N86-17014

A survey of numerical methods for the calculation of inviscid, possibly rotational Euler flows around aeronautical configurations
[NLR-TR-83130-U] p 258 N86-17699

**EVALUATION**

Stress level testing of electronics, avionics communications and C3I equipments
[AD-A159395] p 231 N86-16214

**EVASIVE ACTIONS**

The Adaptive Maneuvering Logic program in support of the pilot's associate program - A heuristic approach to missile evasion
[AIAA PAPER 86-0423] p 263 A86-19865

**EXHAUST GASES**

Fuel property effects upon exhaust smoke and the weak extinction characteristics of the Pratt and Whitney PT6A-65 engine
[ASME PAPER 85-GT-27] p 234 A86-22018

**EXHAUST NOZZLES**

Performance of a forward swept wing fighter utilizing thrust vectoring and reversing p 221 A86-20163

**EXPERIMENT DESIGN**

Simulation and analysis of natural rain in a wind tunnel via digital image processing techniques
[AIAA PAPER 86-0291] p 241 A86-22687

**EXPERT SYSTEMS**

Development of a knowledge acquisition tool for an expert system flight status monitor
[AIAA PAPER 86-0240] p 230 A86-19764

Development of a knowledge acquisition tool for an expert system flight status monitor
[NASA-TM-86802] p 263 N86-16944

**EXPLOSIVE DEVICES**

Approach for service life extension of explosive devices for aircraft escape systems p 243 A86-19349

**EXPLOSIVES**

A scientific method for determining the useful life of explosive devices in aircraft p 243 A86-19312

The use of TLX energy transfer lines on the F-16 aircraft --- Thin Layer eXplosive p 243 A86-19313

**EXPOSURE**

Automatic exposure control employing scene statistics in reconnaissance cameras p 230 A86-19588

**EXTERNAL STORES**

Unsteady transonics of a wing with tip store
[AIAA PAPER 86-0010] p 198 A86-19633

A predictive technique for determining store motion after release from a carrier vehicle at supersonic speeds
[AIAA PAPER 86-0586] p 203 A86-19964

A FORTRAN program for the determination of unsteady airforces on general combinations of interfering lifting surfaces oscillating in subsonic flow
[ARL-STRUCT-R-412] p 206 N86-16191

Triaxial vibration system p 257 N86-16647

**EXTERNALLY BLOWN FLAPS**

A numerical solution of the downwash associated with a blown-flap system
[AIAA PAPER 86-0473] p 202 A86-19892

Blended blown flaps and vectored thrust for low-speed flight
[AIAA PAPER 84-2199] p 221 A86-20157

## F

**F-104 AIRCRAFT**

PC-183B standoff imaging system
p 229 A86-19578

**F-106 AIRCRAFT**

Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes
[AIAA PAPER 86-0021] p 213 A86-19637

**F-111 AIRCRAFT**

F-111 escape systems - Today's module technology
p 217 A86-19311

**F-14 AIRCRAFT**

Evaluation of pilot performance and aircrew protective devices in a simulated F-14 flat spin environment
p 262 A86-19351

F-14A low altitude, low airspeed, high angle of attack asymmetric thrust flight test program
p 222 A86-21053

F-14 re-engining with the F110 engine
[ASME PAPER 85-GT-184] p 224 A86-22098

**F-15 AIRCRAFT**

A Single Point Release System for the Advanced Concept Ejection Seat (ACES) II - Survival kit and parachute risers p 217 A86-19303

F-15 Dual-Role Fighter flight testing
p 224 A86-21065

CAD/CAM designer - Jack of all trades
p 251 A86-21895

Superplastically-formed/diffusion-bonded titanium technology transition case study p 252 A86-22142

**F-16 AIRCRAFT**

A Single Point Release System for the Advanced Concept Ejection Seat (ACES) II - Survival kit and parachute risers p 217 A86-19303

A scientific method for determining the useful life of explosive devices in aircraft p 243 A86-19312

The use of TLX energy transfer lines on the F-16 aircraft --- Thin Layer eXplosive p 243 A86-19313

Progress report - F-16 C&D testing
p 222 A86-21056

The F-16 Common Engine Bay
[ASME PAPER 85-GT-231] p 224 A86-22127

**F-18 AIRCRAFT**

Supersonic conventional weapon testing of the F/A-18A Hornet p 222 A86-21052

Testing Canadian unique features of the CF-18 - The first year p 223 A86-21060

Analysis of the F/A-18 Hornet flight control computer field mean time between failure p 231 A86-22386

F/A-18 Hornet - Reliability development testing
p 225 A86-22400

**F-2 AIRCRAFT**

Design and evaluation of an instrumentation system for measurements in nonsteady symmetrical flight conditions with the Hawker Hunter MK 7
[VTH-LR-308] p 232 N86-16215

**F-20 AIRCRAFT**

F-20A Tigershark progress report p 222 A86-21057

**FABRICATION**

Composites technology transfer and transition
p 253 A86-22144

**FABRICS**

Composite fabrics in a thermal protection application
p 245 A86-21734

**FACTORIZATION**

Numerical analysis for steady transonic flows past an airfoil using AF scheme p 209 N86-17289

Analysis of high Reynolds number transonic flow around an airfoil p 210 N86-17293

**FAILURE ANALYSIS**
Using Fleet reported 3-M data in support of Navy emergency escape parachute assemblies p 212 A86-19326
Repeatability of mixed-mode adhesive debonding p 249 A86-20638
Hardware/software FMEA applied to airplane safety p 253 A86-22396
FINDS: A fault inferring nonlinear detection system programmers manual, version 3.0
[NASA-CR-177986] p 231 N86-16212
The mechanical design of gas turbine blading in cast superalloys
[PNR-90247] p 237 N86-16223
An analysis of rig test disc failures
[PNR-90276] p 237 N86-16224
Robust detection-isolation-accommodation for sensor failures
[NASA-CR-174797] p 255 N86-16486
AVIP Air Force thrust for reliability p 256 N86-16617
CERT: Where we have been, where we are going p 256 N86-16620
Hardware/software Failure Mode Effect Analysis (FMEA) applied to airplane safety
[NLR-MP-84073-U] p 215 N86-17325

**FAILURE MODES**
The automated, advanced matrix FMEA technique --- Failure Modes and Effects Analysis p 253 A86-22382
Hardware/software FMEA applied to airplane safety p 253 A86-22396

**FAIRINGS**
Airworthiness flight test program of an aircraft equipment fairing p 226 N86-16653

**FAN BLADES**
Study of ice accretion on icing wind tunnel components
[NASA-TM-87095] p 242 N86-16232
Mass balancing of hollow fan blades
[NASA-TM-87197] p 255 N86-16611

**FASTENERS**
Fatigue rated fastener systems in aluminum alloy structural joints --- aircraft structures
[NLR-MP-83045-U] p 259 N86-17809

**FATIGUE (MATERIALS)**
Helicopter fatigue monitoring using a single channel recorder p 220 A86-20038
Delamination threshold and loading effect in fiber glass epoxy composite p 244 A86-20636
Repeatability of mixed-mode adhesive debonding p 249 A86-20638
Problems found when introducing new materials --- aircraft industry
[SNIAS-852-551-101] p 198 N86-16190
AGARD Corrosion Handbook. Volume 1: Corrosion, causes and case histories
[AGARD-AG-278-VOL-1] p 248 N86-16374
Stress analysis of 27% scale model of AH-64 main rotor hub
[NASA-TM-87625] p 256 N86-16613
Lecture notes on fatigue, static tensile strength and stress corrosion of aircraft materials and structures. Part 2: Figures
[VTH-LR-360-PT-2] p 227 N86-17345

**FATIGUE LIFE**
Fatigue life prediction under complex load using local strain approach and relative Miner's rule p 249 A86-20173
A case study in fatigue life extension - The main spar of RAAF Mirage IIIO wings p 225 A86-22165
Fatigue life monitoring of aircraft
[NLR-MP-83069-U] p 226 N86-16211

**FATIGUE TESTS**
Cast aluminum fatigue property/microstructure relationships p 244 A86-21707
Effect of manufacturing defects and service-induced damage on the strength of aircraft composite structures p 245 A86-21729
Performance of AV-8B Harrier II structural test program p 241 A86-22189
Is there life after 10,000 flight hours? p 254 A86-22402
Fatigue testing of tube to node butt welds envisaged for RAE Bedford flight simulator
[REPT-23480/2/85] p 257 N86-16674
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 1: Background and fatigue evaluation
[RAE-TR-84084] p 226 N86-17336
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 2: Final definition of Helix and Felix
[RAE-TR-84085] p 226 N86-17337
Fatigue rated fastener systems in aluminum alloy structural joints --- aircraft structures
[NLR-MP-83045-U] p 259 N86-17809

**FAULT TOLERANCE**
FINDS: A fault inferring nonlinear detection system programmers manual, version 3.0
[NASA-CR-177986] p 231 N86-16212
AVIP Air Force thrust for reliability p 256 N86-16617

**FEASIBILITY ANALYSIS**
Conventional takeoff and landing (CTOL) airplane ski jump evaluation p 222 A86-21056

**FEEDBACK CONTROL**
Vectored thrust digital control of ejection seats p 218 A86-19318
Linear-quadratic Gaussian with loop-transfer recovery methodology for the F-100 engine p 233 A86-20233
Facility for closed loop testing of aircraft control systems p 241 A86-22188

**FEEDFORWARD CONTROL**
Gust alleviation using combined control laws p 239 A86-22317

**FIBER OPTICS**
Construction of a measuring method using fiber optics and an LTN-90 laser gyro strapdown system for BO-105 helicopters
[DFVLR-MITT-85-10] p 216 N86-17333

**FIBER REINFORCED COMPOSITES**
Evaluation of the Ciba-Geigy R6376 IM6 prepreg --- fiber reinforced plastics
[DGT-26.649] p 248 N86-17485

**FIBER STRENGTH**
Recent developments in carbon fibre composite p 244 A86-21296

**FIGHTER AIRCRAFT**
Computer tools and techniques for analysis of discrete data from aircrew automated escape systems (AAES) p 260 A86-19302
The future of advanced crew escape capsule technology p 217 A86-19306
Altitude and acceleration protection system for high performance aircraft p 217 A86-19314
Development of an electro-pneumatic anti-G valve for high performance fighter aircraft p 218 A86-19317
Evolution of real time airborne reconnaissance p 229 A86-19586
Use of differential leading edge flaps for lateral control at high angle of attack
[AIAA PAPER 86-0168] p 238 A86-19729
Three-dimensional elliptic grid generation about fighter aircraft for zonal finite-difference computations
[AIAA PAPER 86-0429] p 202 A86-19871
The basics of on-board simulation and embedded training
[AIAA PAPER 86-0493] p 219 A86-19904
Performance of a forward swept wing fighter utilizing thrust vectoring and reversing p 221 A86-20163
Impact of composite materials on advanced fighters p 245 A86-21722
Structural and material considerations for advanced fighters p 252 A86-22134
Old fighters - New targets p 225 A86-22262
Support effectiveness evaluation model --- for military air facilities in sortie generation p 263 A86-22398

**FILAMENT WINDING**
Design of nonaxysymmetric structures (turbojet engine nacelle element)
[SNIAS-852-430-119] p 248 N86-17496

**FILM COOLING**
Design of combustor cooling slots for high film effectiveness. I - Film general development
[ASME PAPER 85-GT-35] p 234 A86-22024
Design of combustor cooling slots for high film effectiveness. II - Film initial region
[ASME PAPER 85-GT-36] p 234 A86-22025
Full coverage discrete hole film cooling - The influence of hole size
[ASME PAPER 85-GT-47] p 251 A86-22035
Heat transfer measurements with film cooling on a turbine blade profile in cascade
[ASME PAPER 85-GT-117] p 251 A86-22070
Development of a design model for airfoil leading edge film cooling
[ASME PAPER 85-GT-120] p 252 A86-22073

**FINITE DIFFERENCE THEORY**
Three-dimensional elliptic grid generation about fighter aircraft for zonal finite-difference computations
[AIAA PAPER 86-0429] p 202 A86-19871
Implicit finite-difference methods for the calculation of unsteady transonic potential flow around two-dimensional airfoils: A discussion
[NLR-MP-83063-U] p 208 N86-16202
Numerical simulation of unsteady flow around an airfoil by finite difference solution of Navier-Stokes equations p 209 N86-17273
Transonic internal flow about an airfoil oscillating in pitch: Comparisons between computation and experiment p 209 N86-17276
Numerical analysis of transonic flow around two-dimensional airfoil by solving Navier-Stokes equations p 210 N86-17292

**FINITE ELEMENT METHOD**
Finite element analysis of an ultralight aircraft p 221 A86-20165
Developing concepts in the rotordynamic analysis of aero gas turbines
[ASME PAPER 85-GT-230] p 236 A86-22126

**FINITE VOLUME METHOD**
Calculations of transonic flows around single and multielement airfoils on a small computer
[REPT-84-48] p 208 N86-16205

**FIRES**
Controlled Impact Demonstration (CID)
[GPO-46-870] p 214 N86-17324

**FIRING (IGNITING)**
Ballistic gas fired devices p 240 A86-19328

**FIXED WINGS**
Flight testing the fixed wing configuration of the Rotor Systems Research Aircraft (RSRA) p 223 A86-21064

**FLAME PROPAGATION**
The two-fluid model of turbulent combustion applied to an idealised one-dimensional, unsteady, confined, pre-mixed flame
[PDR/CFDU/IC/21] p 247 N86-16315

**FLAME STABILITY**
The two-fluid model of turbulent combustion applied to an idealised one-dimensional, unsteady, confined, pre-mixed flame
[PDR/CFDU/IC/21] p 247 N86-16315

**FLAME TEMPERATURE**
Flame temperature estimation of conventional and future jet fuels
[ASME PAPER 85-GT-31] p 246 A86-22020

**FLAT PLATES**
Dual rectangular jets from a flat plate in a crossflow
[AIAA PAPER 86-0477] p 255 A86-22703

**FLIGHT CHARACTERISTICS**
A flightpath overshoot flying qualities metric for the landinig task
[AIAA PAPER 86-0334] p 238 A86-19820
Non-rigid airship testing p 223 A86-21059
F-15 Dual-Role Fighter flight testing p 224 A86-21065
Flight dynamics and aircraft piloting
[ESA-TT-874] p 240 N86-16229

**FLIGHT CLOTHING**
Laboratory and flight testing of ballistic protective headgear for rotary wing aircrew p 261 A86-19344

**FLIGHT CONTROL**
Development of a knowledge acquisition tool for an expert system flight status monitor
[AIAA PAPER 86-0240] p 230 A86-19764
Flight test maneuver modeling and control
[AIAA PAPER 86-0426] p 219 A86-19868
An engineering simulation of the Boeing 747 primary flight control systems
[AIAA PAPER 86-0494] p 239 A86-19905
Endurance increase by cyclic control --- of aircraft p 221 A86-20235
A redundant strapdown reference for advanced aircraft flight control systems p 239 A86-21840
Facility for closed loop testing of aircraft control systems p 241 A86-22188
Analysis of the F/A-18 Hornet flight control computer field mean time between failure p 231 A86-22386
Development of a knowledge acquisition tool for an expert system flight status monitor
[NASA-TM-86802] p 263 N86-16944
Development of a sensitivity analysis technique for multiloop flight control systems
[NASA-CR-166619] p 240 N86-17358
Computer Aided Design (CAD) at the National Aerospace Laboratory (Netherlands) with the accent on aircraft flight control systems
[NLR-MP-84032-U] p 264 N86-18030

**FLIGHT CREWS**
Development of mechanical components for advanced aircrew seating systems p 217 A86-19307
Altitude and acceleration protection system for high performance aircraft p 217 A86-19314
Aircrew escape system models used in wind tunnel tests p 217 A86-19316
The Canadian forces twin Otter aircraft operations in the Arctic - A thermal assessment p 212 A86-19334

**FLIGHT HAZARDS**
Description of and results from camera systems for recording daytime lightning strikes to an airplane in flight
[AIAA PAPER 84-0020] p 230 A86-19636

**FLIGHT INSTRUMENTS**
Search and Rescue (SAR) System developed as part of the contract signed with the Irish Air Corps for the supply of 365 F Dauphin aircraft
[SNIAS-852-210-105] p 215 N86-17329
**FLIGHT LOAD RECORDERS**
Fatigue life monitoring of aircraft
[NLR-MP-83069-U] p 226 N86-16211
**FLIGHT MECHANICS**
Flight dynamics and aircraft piloting
[ESA-TT-874] p 240 N86-16229
**FLIGHT OPTIMIZATION**
Endurance increase by cyclic control --- of aircraft
p 221 A86-20235

**FLIGHT PATHS**
A flightpath overshoot flying qualities metric for the lendinig task
[AIAA PAPER 86-0334] p 238 A86-19820
Endurance increase by cyclic control --- of aircraft
p 221 A86-20235

Aircraft terminal area guidance based on the discrete tracking problem of optimal control theory
p 215 A86-20520

Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance: Preliminary results
[NASA-TM-87637] p 265 N86-17077
Three-dimensional flight-path reconstruction by means of spline approximation
[NLR-TR-83091-U] p 228 N86-17347
**FLIGHT SAFETY**
Real-time measurement of ice growth during simulated and natural icing conditions using ultrasonic pulse-echo techniques
[AIAA PAPER 86-0410] p 214 A86-19860
Activities in air traffic control p 216 N86-17331
**FLIGHT SIMULATION**
Evaluation of pilot performance and aircrew protective devices in a simulated F-14 flat spin environment
p 262 A86-19351

Wind shear characterization
[AIAA PAPER 86-0180] p 213 A86-19737
Use of simulation during preliminary design of the V-22 Osprey
[AIAA PAPER 86-0491] p 238 A86-19902
Investigation of aircraft departure susceptibility using a total-G simulator
[AIAA PAPER 86-0492] p 238 A86-19903
Facility for closed loop testing of aircraft control systems p 241 A86-22188
Fatigue rated fastener systems in aluminum alloy structural joints --- aircraft structures
[NLR-MP-83045-U] p 259 N86-17809
**FLIGHT SIMULATORS**
Simulation of a six degrees of freedom flight simulator motion system
[UA-00-39] p 241 N86-16230
Fatigue testing of tube to node butt welds envisaged for RAE Bedford flight simulator
[REPT-23480/2/85] p 257 N86-16674
**FLIGHT TEST INSTRUMENTS**
Design and evaluation of an instrumentation system for measurements in nonsteady symmetrical flight conditions with the Hawker Hunter MK 7
[VTH-LR-308] p 232 N86-16215
Construction of a measuring method using fiber optics and an LTN-90 laser gyro strapdown system for BO-105 helicopters
[DFVLR-MITT-85-10] p 216 N86-17333
Operational application of the STALINS method for measuring take-off and landing trajectories
[NLR-TR-83010-U] p 227 N86-17346
The application of sensors in light tests
[NLR-MP-84056-U] p 232 N86-17352
**FLIGHT TESTS**
KS-146A camera development and flight test results
p 229 A86-19583

Camera flight tests and image evaluation
p 230 A86-19591

Dynamics and controls flight testing of the X-29A airplane
[AIAA PAPER 86-0167] p 237 A86-19728
Development of a knowledge acquisition tool for an expert system flight status monitor
[AIAA PAPER 86-0240] p 230 A86-19764
Spanwise turbulence effects on aircraft response
[AIAA PAPER 86-0255] p 200 A86-19774
Flight test maneuver modeling and control
[AIAA PAPER 86-0426] p 219 A86-19868
Society of Experimental Test Pilots, Symposium, 28th, Beverly Hills, CA, September 26-29, 1984, Proceedings
p 221 A86-21051

Supersonic conventional weapon testing of the F/A-18A Hornet p 222 A86-21052
F-14A low altitude, low airspeed, high angle of attack asymmetric thrust flight test program
p 222 A86-21053
AV-8B initial sea trials p 222 A86-21054
Progress report - F-16 C&D testing
p 222 A86-21056
F-20A Tigershark progress report p 222 A86-21057
Conventional takeoff and landing (CTOL) airplane ski jump evaluation p 222 A86-21058
Non-rigid airship testing p 223 A86-21059
Structural demonstration of the AV-8B Harrier II
p 223 A86-21061
Escape systems testing p 223 A86-21063
Flight testing the fixed wing configuration of the Rotor Systems Research Aircraft (RSRA) p 223 A86-21064
F-15 Dual-Role Fighter flight testing
p 224 A86-21065
Canard Mirage on test p 225 A86-22261
Exploring the unknown with unmanned aircraft
p 225 A86-22263
Design and evaluation of an instrumentation system for measurements in nonsteady symmetrical flight conditions with the Hawker Hunter MK 7
[VTH-LR-308] p 232 N86-16215
Airworthiness flight test program of an aircraft equipment fairing p 226 N86-16653
Maximum-likelihood estimation of parameters in linear systems from flight test data. A FORTRAN program
[ESA-TT-896] p 264 N86-16969
The deiced super Puma --- helicopters
[SNIAS-852-210-104] p 215 N86-17328
Helicopter-ship qualification testing
[NLR-MP-84062-U] p 227 N86-17343
Operational application of the STALINS method for measuring take-off and landing trajectories
[NLR-TR-83010-U] p 227 N86-17346
The application of sensors in light tests
[NLR-MP-84056-U] p 232 N86-17352
**FLIGHT VEHICLES**
A parallel quasi-linearization algorithm for air vehicle trajectory optimization
[AIAA PAPER 85-0498] p 243 A86-20244
**FLOW CHARACTERISTICS**
A numerical simulation of the inviscid flow through a counter-rotating propeller
[NASA-TM-87200] p 207 N86-16195
**FLOW DEFLECTION**
A solution to the problem of flow past wings with allowance for flow separation on the basis of a system of Euler equations p 205 A86-21345
Numerical simulation of transonic separated flows over low-aspect ratio wings
[AIAA PAPER 86-0508] p 206 A86-22704
**FLOW DISTRIBUTION**
Evaluation of methods for predicting complex aircraft flowfields
[AIAA PAPER 86-0396] p 201 A86-19855
Three-dimensional body-fitting grid system for a complete aircraft
[AIAA PAPER 86-0428] p 201 A86-19870
A three-dimensional viscous flow analysis for the helicopter tip vortex generation process about square and round tipped blades
[AIAA PAPER 86-0560] p 203 A86-19949
Numerical simulation of the transonic flowfield for wing/nacelle configurations p 204 A86-20159
The numerical solution of the compressible viscous flow field about a complete aircraft in flight
p 205 A86-21033
Interdependence of centrifugal compressor blade geometry and relative flow field
[ASME PAPER 85-GT-85] p 251 A86-22056
Production and development of secondary flows and losses within a three dimensional turbine stator cascade
[ASME PAPER 85-GT-217] p 205 A86-22115
Numerical solution of 2-D thrust reversing and thrust vectoring nozzle
[AIAA PAPER 86-0203] p 254 A86-22681
Simulation of diffuser duct flowfields using a three-dimensional Euler/Navier-Stokes algorithm
[AIAA PAPER 86-0310] p 206 A86-22692
Numerical simulation of transonic separated flows over low-aspect ratio wings
[AIAA PAPER 86-0508] p 206 A86-22704
Flow field survey near the rotational plane of an advanced design propeller on a JetStar airplane
[NASA-TM-86037] p 207 N86-16196
Mach number and flow-field calibration at the advanced design propeller location on the JetStar airplane
[NASA-TM-84923] p 207 N86-16197
Investigation of the development of laminar boundary-layer instabilities along a sharp cone
[AD-A159370] p 255 N86-16521
Numerical simulation of the leading-edge separation vortex over delta wing p 209 N86-17271
Numerical simulation of unsteady flow around an airfoil by finite difference solution of Navier-Stokes equations
p 209 N86-17273
Validation and comparison with experiment of a high Reynolds number transonic flow airfoil analysis code NSFOIL p 210 N86-17294
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[RAE-TM-AERO-2026] p 211 N86-17307
**FLOW EQUATIONS**
Shock modelling in transonic and supersonic flow
p 204 A86-20946

**FLOW GEOMETRY**
Visualization and flow surveys of the leading edge vortex structure on delta wing planforms
[AIAA PAPER 86-0330] p 201 A86-19817
Inverse design of coolant flow passage shapes with partially fixed internal geometries
[ASME PAPER 85-GT-118] p 252 A86-22071
Calculation of external and internal transonic flow field of a three-dimensional shielded S-shaped inlet
p 205 A86-22303

**FLOW MEASUREMENT**
Oscillating hot-wire measurements above an FX63-137 airfoil
[AIAA PAPER 86-0012] p 199 A86-19635
An experimental investigation of propeller wakes using a laser Doppler velocimeter
[AIAA PAPER 86-0080] p 232 A86-19677
Vortex roll-up for an elliptically-loaded wing at moderately low Reynolds numbers
[AIAA PAPER 86-0562] p 203 A86-19951
**FLOW VISUALIZATION**
An experimental investigation of an airfoil pitching at moderate to high rates to large angles of attack
[AIAA PAPER 86-0008] p 198 A86-19631
Visualization and flow surveys of the leading edge vortex structure on delta wing planforms
[AIAA PAPER 86-0330] p 201 A86-19817
**FLUID FILMS**
Investigation of jet-filming airblast atomizer
[ASME PAPER 85-GT-185] p 252 A86-22099
**FLUID FLOW**
A transonic rectangular grid embedded panel method
p 204 A86-20953

**FLUID JETS**
Investigation of jet-filming airblast atomizer
[ASME PAPER 85-GT-185] p 252 A86-22099
**FLUTTER**
Design of an active flutter suppression system
p 239 A86-20236

Control of a forward-swept-wing configuration dominated by flight dynamic/aeroelastic interactions
p 239 A86-20237

Application of time-linearized methods of oscillating wings in transonic flow and flutter
[NLR-MP-84077-U] p 208 N86-16204
**FLUTTER ANALYSIS**
Mass balancing of hollow fan blades
[NASA-TM-87197] p 255 N86-16611
Transonic internal flow about an airfoil oscillating in pitch: Comparisons between computation and experiment
p 209 N86-17278

**FLY BY WIRE CONTROL**
Dynamics and controls flight testing of the X-29A airplane
[AIAA PAPER 86-0167] p 237 A86-19728
**FLYING EJECTION SEATS**
Yaw stabilization of an open ejection seat, fact or fantasy? p 217 A86-19305
Controllable ejection seat catapult program
p 218 A86-19339

**FLYING PLATFORMS**
Laser systems for use with airborne platforms
p 228 A86-19571

**FOKKER AIRCRAFT**
Activities report in aircraft development and astronautics p 267 N86-17233
Activities report in aerospace research, with data concerning the scientific committee NLR-NIVR, international cooperation concerning AGARD, DNW, GARTEUR and cooperation with Indonesia
p 257 N86-17588

**FORCE DISTRIBUTION**
Summary of a high subsonic force/pressure experiment for 58 deg cambered/twisted thick delta wings
[AIAA PAPER 86-0169] p 200 A86-19730
**FORCED VIBRATION**
Strategies for dynamic modeling of a helicopter structure
[SNIAS-852-210-101] p 228 N86-17350
**FOREBODIES**
Experimental study of effects of forebody geometry on high angle of attack static and dynamic stability
[AIAA PAPER 86-0331] p 238 A86-19818

**FRACTURE MECHANICS**
The damage tolerance approach in the type approval process p 220 A86-20036
Structural evolution B-58 to F-16 p 225 A86-22132

**FREE BOUNDARIES**
Measurements of rotating bubble shapes in low-gravity environment p 251 A86-21996

**FREE JETS**
Acoustic evaluation of the German-Dutch Wind Tunnel (DNW) shear layer correction using a model jet
[DNW-TR-82-04] p 242 N86-16237

**FREQUENCY DIVISION MULTIPLEXING**
A high bandwidth signal distribution system for aircraft Stores Management Systems (SMS)
p 231 A86-20505

**FUEL CELLS**
Fuel resistant coatings for applications in integral tanks & bladder fuel cells p 246 A86-21737

**FUEL COMBUSTION**
The effect of fuel composition upon combustion performance in a Rolls Royce Tyne combustor
[ASME PAPER 85-GT-39] p 234 A86-22028
Cold flow and combustion experiments with a new burner air distribution concept
[ASME PAPER 85-GT-40] p 235 A86-22029

**FUEL CONSUMPTION**
Design of a twin-engine short-haul commuter aircraft for the 1990s
[AIAA PAPER 86-0077] p 219 A86-19674

**FUEL SYSTEMS**
Evaluation of fuel preparation systems for lean premixing-prevaporizing combustors
[ASME PAPER 85-GT-137] p 235 A86-22081

**FUEL TANKS**
Electrodeposited primer scale-up and qualification
p 245 A86-21735
Improved temperature resistant sealants for composite & adhesive bonded fuel-tank structures
p 246 A86-21736
Fuel resistant coatings for applications in integral tanks & bladder fuel cells p 246 A86-21737

**FUEL TESTS**
The quantification and improvement of the thermal stability of aviation turbine fuel
[ASME PAPER 85-GT-33] p 247 A86-22022

**FUEL-AIR RATIO**
Fuel property effects upon exhaust smoke and the weak extinction characteristics of the Pratt and Whitney PT6A-65 engine
[ASME PAPER 85-GT-27] p 234 A86-22018
Evaluation of fuel preparation systems for lean premixing-prevaporizing combustors
[ASME PAPER 85-GT-137] p 235 A86-22081

**FULL SCALE TESTS**
Development of pneumatic thrust-deflecting powered-lift systems
[AIAA PAPER 86-0476] p 219 A86-19894

**FUNCTIONAL DESIGN SPECIFICATIONS**
Composite materials: A source of innovation --- aircraft industry
[SNIAS-852-430-113] p 248 N86-17493

**FUSELAGES**
Shaping of airplane fuselages for minimum drag
[AIAA PAPER 86-0316] p 201 A86-19809
Laboratory study of the effects of sidewall treatment, source directivity and temperature on the interior noise of a light aircraft fuselage
[AIAA PAPER 86-0390] p 219 A86-19851
Bigger is better - Stretching the C-141 Starlifter
p 220 A86-20125
Laboratory study of cabin acoustic treatments installed in an aircraft fuselage p 221 A86-20158
Elimination of buffeting on the rear fuselage of the Hercules tanker p 221 A86-20822
Calculation of misalignment error of multi-joint holes of wing to fuselage p 253 A86-22318
Flow field survey near the rotational plane of an advanced design propeller on a JetStar airplane
[NASA-TM-86037] p 207 N86-16196
Passive damping, sonic fatigue and the KC-135A
p 256 N86-16625

## G

**GAS DYNAMICS**
Shock modelling in transonic and supersonic flow
p 204 A86-20946

**GAS GENERATORS**
Fuel property effects upon exhaust smoke and the weak extinction characteristics of the Pratt and Whitney PT6A-65 engine
[ASME PAPER 85-GT-27] p 234 A86-22018

**GAS INJECTION**
Vortices produced by air pulse injection from the surface of an oscillating airfoil
[AIAA PAPER 86-0118] p 199 A86-19699

**GAS TURBINE ENGINES**
'Smart' engine components - A micro in every blade?
p 234 A86-21896
Fuel property effects upon exhaust smoke and the weak extinction characteristics of the Pratt and Whitney PT6A-65 engine
[ASME PAPER 85-GT-27] p 234 A86-22018
Design of combustor cooling slots for high film effectiveness. I - Film general development
[ASME PAPER 85-GT-35] p 234 A86-22024
Design of combustor cooling slots for high film effectiveness. II - Film initial region
[ASME PAPER 85-GT-36] p 234 A86-22025
The effect of fuel composition upon combustion performance in a Rolls Royce Tyne combustor
[ASME PAPER 85-GT-39] p 234 A86-22028
Full coverage discrete hole film cooling - The influence of hole size
[ASME PAPER 85-GT-47] p 251 A86-22035
A review and analysis of boundary layer transition data for turbine application
[ASME PAPER 85-GT-83] p 251 A86-22054
Strain isolated ceramic coatings for gas turbine engines
[ASME PAPER 85-GT-96] p 247 A86-22062
Heat transfer measurements with film cooling on a turbine blade profile in cascade
[ASME PAPER 85-GT-117] p 251 A86-22070
Power dense gas turbine APUs
[ASME PAPER 85-GT-124] p 235 A86-22074
Developing concepts in the rotordynamic analysis of aero gas turbines
[ASME PAPER 85-GT-230] p 236 A86-22126
The little turbine business p 236 A86-22200
The mechanical design of gas turbine blading in cast superalloys
[PNR-90247] p 237 N86-16223
Hot corrosion in aircraft engines
[ESA-TT-887] p 237 N86-16227
A smoke generator for the absolute calibration of gas turbine engine smoke sampling and measuring systems
[RAE-TM-P-1044] p 258 N86-17702

**GAS TURBINES**
NASA Lewis Research Center/university graduate research program on engine structures
[ASME PAPER 85-GT-159] p 252 A86-22084

**GENERAL AVIATION AIRCRAFT**
Design of a natural laminar flow wing for a transonic corporate transport
[AIAA PAPER 86-0314] p 200 A86-19807

**GEOGRAPHIC INFORMATION SYSTEMS**
Using a menu-based natural language interface to ask spatial database queries p 259 A86-20665

**GLASS FIBER REINFORCED PLASTICS**
Delamination threshold and loading effect in fiber glass epoxy composite p 244 A86-20636

**GLIDERS**
Environment-friendly propeller aircraft with a maximum weight of 5700 kg, and motor gliders: Publication of the noise values p 227 N86-17341

**GRAPHITE-EPOXY COMPOSITES**
Thermographic inspection of carbon epoxy structures
p 249 A86-20649
Structural demonstration of the AV-8B Harrier II
p 223 A86-21061
SF-340 airfoil structure - A unique approach
p 224 A86-21712
Applications of tubular composite structures
p 245 A86-21719

**GROUND EFFECT MACHINES**
Operating experience in the Jeff (A) in the Arctic
[ASME PAPER 85-GT-127] p 266 A86-22076

**GROUND SUPPORT EQUIPMENT**
The role of a real-time flight support facility in flight research programs
[AIAA PAPER 86-0166] p 241 A86-19727

**GROUND TESTS**
Structural demonstration of the AV-8B Harrier II
p 223 A86-21061

**GROUND TRUTH**
Spectroradiometric calibration of the Thematic Mapper and multispectral scanner system
[E86-10022] p 260 N86-17816

**GUST ALLEVIATORS**
Gust alleviation using combined control laws
p 239 A86-22317

**GYROSCOPES**
A redundant strapdown reference for advanced aircraft flight control systems p 239 A86-21840

## H

**HARDWARE**
Hardware/software FMEA applied to airplane safety
p 253 A86-22396

**HARRIER AIRCRAFT**
AV-8B initial sea trials p 222 A86-21054
Structural demonstration of the AV-8B Harrier II
p 223 A86-21061
Re-engining the Harrier
[ASME PAPER 85-GT-175] p 235 A86-22091
Performance of AV-8B Harrier II structural test program p 241 A86-22189

**HEAT EXCHANGERS**
Study of ice accretion on icing wind tunnel components
[NASA-TM-87095] p 242 N86-16232

**HEAT RESISTANT ALLOYS**
High strength nickel-palladium-chromium brazing alloys p 244 A86-20579
Hot corrosion in aircraft engines
[ESA-TT-887] p 237 N86-16227

**HEAT TRANSFER**
A review and analysis of boundary layer transition data for turbine application
[ASME PAPER 85-GT-83] p 251 A86-22054
Research on antimisting fuel for suppression of postcrash aircraft fires
[AIAA PAPER 86-0573] p 247 A86-22706

**HEAT TRANSFER COEFFICIENTS**
Heat transfer measurements with film cooling on a turbine blade profile in cascade
[ASME PAPER 85-GT-117] p 251 A86-22070

**HELICOPTER CONTROL**
An investigation of adaptive controllers for helicopter vibration and the development of a new dual controller
[NASA-CR-177377] p 239 N86-16228

**HELICOPTER DESIGN**
The continuing requirement for helicopter escape
p 217 A86-19308

**HELICOPTER PERFORMANCE**
Helicopter-ship qualification testing
[NLR-MP-84062-U] p 227 N86-17343

**HELICOPTER TAIL ROTORS**
Analysis of the noise emitted by a tail rotor
p 266 N86-18129

**HELICOPTERS**
How much inherent buoyancy is acceptable in a helicopter passenger immersion suit
p 261 A86-19310
A three-dimensional viscous flow analysis for the helicopter tip vortex generation process about square and round tipped blades
[AIAA PAPER 86-0560] p 203 A86-19949
Helicopter fatigue monitoring using a single channel recorder p 220 A86-20038
Stress analysis of 27% scale model of AH-64 main rotor hub
[NASA-TM-87625] p 256 N86-16613
The deiced super Puma --- helicopters
[SNIAS-852-210-104] p 215 N86-17328
Search and Rescue (SAR) System developed as part of the contract signed with the Irish Air Corps for the supply of 365 F Dauphin aircraft
[SNIAS-852-210-105] p 215 N86-17329
Helicopter-ship qualification testing
[NLR-MP-84062-U] p 227 N86-17343
Strategies for dynamic modeling of a helicopter structure
[SNIAS-852-210-101] p 226 N86-17350
Spectroradiometric calibration of the Thematic Mapper and multispectral scanner system
[E86-10022] p 260 N86-17816
Helicopter internal noise treatment. Recent methodolgies and practical applications
[SNIAS-852-210-102] p 266 N86-18133

**HELMET MOUNTED DISPLAYS**
The basics of on-board simulation and embedded training
[AIAA PAPER 86-0493] p 219 A86-19904

**HELMETS**
Laboratory and flight testing of ballistic protective headgear for rotary wing aircrew p 261 A86-19344

**HEURISTIC METHODS**
The Adaptive Maneuvering Logic program in support of the pilot's associate program - A heuristic approach to missile evasion
[AIAA PAPER 86-0423] p 263 A86-19865

**HIGH ALTITUDE**
Altitude and acceleration protection system for high performance aircraft p 217 A86-19314
X-15 high temperature advanced structure
p 268 A86-22137

**HIGH REYNOLDS NUMBER**
Pressure distributions from high Reynolds number tests of a Boeing BAC 1 airfoil in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87600] p 208 N86-16199
Investigation of the aerodynamic forces on bluff bodies at high Reynolds numbers
[ESA-TT-914] p 209 N86-16206
Validation and comparison with experiment of a high Reynolds number transonic flow airfoil analysis code NSFOIL p 210 N86-17294

**HIGH SPEED**
Lubrication and performance of high-speed rolling-element bearings p 248 A86-19375

**HIGH STRENGTH ALLOYS**
Research on high-strength aerospace aluminum alloys p 244 A86-20037
High strength nickel-palladium-chromium brazing alloys p 244 A86-20579

**HIGH STRENGTH STEELS**
Structural evolution B-58 to F-16 p 225 A86-22132

**HIGH TEMPERATURE GASES**
Ballistic gas fired devices p 240 A86-19326

**HISTORIES**
Air and space flight. Dream and facts
[MBB-FILM-382] p 198 N86-16188

**HOLES**
Full coverage discrete hole film cooling - The influence of hole size
[ASME PAPER 85-GT-47] p 251 A86-22035
Calculation of misalignment error of multi-joint holes of wing to fuselage p 253 A86-22318

**HOLOGRAPHIC INTERFEROMETRY**
Description of a nondestructive facility using holographic interferometry
[SNIAS-852-430-105] p 258 N86-17726

**HONEYCOMB CORES**
The material development, component manufacture, and post-service evaluation of RB211-524 cowl doors utilizing carbon fibre composite materials
[PNR-90275] p 247 N86-16273

**HONEYCOMB STRUCTURES**
Structural evolution B-58 to F-16 p 225 A86-22132

**HOT CORROSION**
Hot corrosion in aircraft engines
[ESA-TT-887] p 237 N86-16227

**HOT PRESSING**
Titanium Near Net Shape components for demanding airframe applications p 245 A86-21726

**HOT WORKING**
SPF aluminum - A first for the S-76B helicopter --- Superplastic Forming p 250 A86-21709

**HOT-WIRE FLOWMETERS**
Oscillating hot-wire measurements above an FX63-137 airfoil
[AIAA PAPER 86-0012] p 198 A86-19635

**HOVERING**
Scaling of helicopter main rotor noise in hover
[AIAA PAPER 86-0393] p 265 A86-22699

**HUMAN CENTRIFUGES**
Evaluation of pilot performance and aircrew protective devices in a simulated F-14 flat spin environment p 262 A86-19351

**HUMAN FACTORS ENGINEERING**
Development of mechanical components for advanced aircrew seating systems p 217 A86-19307
How much inherent buoyancy is acceptable in a helicopter passenger immersion suit p 261 A86-19310
Understanding natural language commands p 263 A86-20667
Evaluation of 23 inch radar viewing unit for Heathrow approach control room
[CAA-PAPER-85011] p 216 N86-16209

**HYDROCARBON FUELS**
Fuel property effects upon exhaust smoke and the weak extinction characteristics of the Pratt and Whitney PT6A-65 engine
[ASME PAPER 85-GT-27] p 234 A86-22018

**HYDROCARBON POISONING**
USAF toxicology research on petroleum and shale-derived aviation gas turbine fuels
[ASME PAPER 85-GT-34] p 262 A86-22023

**HYPERSONIC AIRCRAFT**
Three-dimensional body-fitting grid system for a complete aircraft
[AIAA PAPER 86-0428] p 201 A86-19870

**I**

**ICE**
Numerical simulation of the leading-edge separation vortex over delta wing p 209 N86-17271

**ICE ENVIRONMENTS**
The Canadian forces twin Otter aircraft operations in the Arctic - A thermal assessment p 212 A86-19334

**ICE FORMATION**
Real-time measurement of ice growth during simulated and natural icing conditions using ultrasonic pulse-echo techniques
[AIAA PAPER 86-0410] p 214 A86-19860
Aerodynamic measurements of an airfoil with simulated glaze ice
[AIAA PAPER 86-0484] p 202 A86-19897
Airfoil aerodynamics in icing conditions p 204 A86-20164
Formation and characterization of simulated small droplet icing clouds
[AIAA PAPER 86-0409] p 254 A86-22700
Study of ice accretion on icing wind tunnel components
[NASA-TM-87095] p 242 N86-16232
The deiced super Puma --- helicopters
[SNIAS-852-210-104] p 215 N86-17328

**IMAGE ANALYSIS**
Air targeting of the third kind - Airborne vehicles p 230 A86-19617

**IMAGE INTENSIFIERS**
Application of biocular viewers to airborne reconnaissance p 229 A86-19580

**IMAGE PROCESSING**
Evolution of real time airborne reconnaissance p 229 A86-19586
Towards robust image matching algorithms p 230 A86-19620
Simulation and analysis of natural rain in a wind tunnel via digital image processing techniques
[AIAA PAPER 86-0291] p 241 A86-22687
Image processing of aerodynamic data
[NASA-TM-87629] p 255 N86-16553

**IMPACT DAMAGE**
Effect of manufacturing defects and service-induced damage on the strength of aircraft composite structures p 245 A86-21729

**IMPACT RESISTANCE**
Evaluation of the Ciba-Geigy R6376 IM6 prepreg --- fiber reinforced plastics
[DGT-26.649] p 248 N86-17485

**IMPACT TESTS**
The Shock and Vibration Bulletin 55. Part 2: Dynamic testing, flight vehicle dynamics, seismic loads and fluid-structure interaction
[AD-A160264] p 257 N86-16646

**IMPELLERS**
Interdependence of centrifugal compressor blade geometry and relative flow field
[ASME PAPER 85-GT-85] p 251 A86-22056

**IN-FLIGHT MONITORING**
Description of and results from camera systems for recording daytime lightning strikes to an airplane in flight
[AIAA PAPER 84-0020] p 230 A86-19636
The lightning threat to aerospace vehicles p 214 A86-20162
Fatigue life monitoring of aircraft
[NLR-MP-83069-U] p 226 N86-16211

**INCOMPRESSIBLE FLOW**
Numerical simulation of unsteady flow around an airfoil by finite difference solution of Navier-Stokes equations p 209 N86-17273

**INERTIAL PLATFORMS**
Operational application of the STALINS method for measuring take-off and landing trajectories
[NLR-TR-83010-U] p 227 N86-17346

**INFRARED DETECTORS**
A new generation advanced I.R. Linescan Sensor system p 229 A86-19585

**INFRARED IMAGERY**
Towards robust image matching algorithms p 230 A86-19620

**INFRARED RADIATION**
Infrared emission from jet engine exhaust plumes
[AIAA PAPER 86-0465] p 233 A86-19888

**INGESTION (ENGINES)**
Quantitative determination of engine water ingestion
[AIAA PAPER 86-0307] p 254 A86-22690

**INLET FLOW**
Calculation of external and internal transonic flow field of a three-dimensional shielded S-shaped inlet p 205 A86-22303

**INLET NOZZLES**
Simulation of diffuser duct flowfields using a three-dimensional Euler/Navier-Stokes algorithm
[AIAA PAPER 86-0310] p 206 A86-22692

**INSERTION LOSS**
Laboratory study of cabin acoustic treatments installed in an aircraft fuselage p 221 A86-20158

**INSPECTION**
Nondestructive inspection: An efficient investment --- composite materials
[SNIAS-852-430-110] p 247 N86-16276
Quadrinomial distribution for the characterization of nondestructive inspection (NDI) reliability
[NLR-MP-84064-U] p 256 N86-17774

**INSTRUMENT ERRORS**
Development of a piezoelectric quartz pressure sensor for avionics with excellent long term stability (with final demonstration of the results on a prototype)
[BMFT-FB-W-85-010] p 232 N86-17353

**INSTRUMENT LANDING SYSTEMS**
Simulator evaluation of a remotely piloted vehicle visual landing task p 221 A86-20238

**INSTRUMENT ORIENTATION**
Oscillating hot-wire measurements above an FX63-137 airfoil
[AIAA PAPER 86-0012] p 198 A86-19635

**INTEGRAL EQUATIONS**
A numerical solution of the transonic integral equation and its application to three-dimensional transonic wing design p 226 N86-17298
A wing design based on the three-dimensional transonic inverse method and the comparison with the wind tunnel testing data p 226 N86-17299

**INTEGRATED OPTICS**
Symposium Gyro Technology 1984; Proceedings of the Symposium, Universitaet Stuttgart, West Germany, September 11, 12, 1984 p 250 A86-21826

**INTELLIGIBILITY**
Application of active noise reduction for hearing protection and speech intelligibility improvement
[IZF-1985-7] p 266 N86-18131

**INTERACTIONAL AERODYNAMICS**
Fluid dynamics of cylinder response to Karman vortex shedding
[AIAA PAPER 86-0119] p 199 A86-19700
Numerical simulation of impinging jets
[AIAA PAPER 86-0279] p 200 A86-19789
Isolated and interacting round parallel heated jets
[AIAA PAPER 86-0281] p 264 A86-19790
Vortex-airfoil interaction tests
[AIAA PAPER 86-0354] p 201 A86-19833
Analysis of interacting dual lifting ejector systems
[AIAA PAPER 86-0478] p 233 A86-19895

**INTERFERENCE IMMUNITY**
Evolution of the air traffic control beacon system p 215 A86-21606

**INTERPOLATION**
Multi-knot Boolean sum interpolating surface interactive design of aircraft configuration p 263 A86-22305

**INTERPROCESSOR COMMUNICATION**
Local area command/control networks: The design of an on-board network - ANTINEA --- French thesis p 215 A86-21327

**INVARIANCE**
Upsilon invariants - A uniform set of moment invariants p 262 A86-19608

**INVESTIGATION**
An investigation of adaptive controllers for helicopter vibration and the development of a new dual controller
[NASA-CR-177377] p 239 N86-16228

**INVISCID FLOW**
Numerical issues in computing inviscid supersonic flow over conical delta wings
[AIAA PAPER 86-0440] p 206 A86-22701
Validation of viscous and inviscid computational methods for turbomachinery components
[NASA-TM-87193] p 207 N86-16194
A numerical simulation of the inviscid flow through a counter-rotating propeller
[NASA-TM-87200] p 207 N86-16195
Analysis of high Reynolds number transonic flow around an airfoil p 210 N86-17293
A survey of numerical methods for the calculation of inviscid, possibly rotational Euler flows around aeronautical configurations
[NLR-TR-83130-U] p 258 N86-17699

**IONOSPHERIC SOUNDING**
Comparison of calculated and measured height profiles of transverse electric VLF signals across the daytime earth-ionosphere waveguide p 250 A86-21513

**ISOLATION**
Robust detection-isolation-accommodation for sensor failures
[NASA-CR-174797] p 255 N86-16486

**ISOSTATIC PRESSURE**
Titanium Near Net Shape components for demanding airframe applications p 245 A86-21726

## J

**JET AIRCRAFT NOISE**
Isolated and interacting round parallel heated jets
[AIAA PAPER 86-0261] p 264 A86-19790

**JET ENGINE FUELS**
Flame temperature estimation of conventional and future jet fuels
[ASME PAPER 85-GT-31] p 246 A86-22020
The quantification and improvement of the thermal stability of aviation turbine fuel
[ASME PAPER 85-GT-33] p 247 A86-22022

**JET ENGINES**
Synchronizing characteristics of a large variable frequency starting system p 249 A86-20516

**JET EXHAUST**
Infrared emission from jet engine exhaust plumes
[AIAA PAPER 86-0465] p 233 A86-19888
Dispersion process of jet engine exhaust plume. II - Buoyant jet p 234 A86-20448

**JET FLAPS**
A numerical solution of the downwash associated with a blown-flap system
[AIAA PAPER 86-0473] p 202 A86-19892
A vortex lattice method for jet wing performance with nonlinear wake and tip flow p 205 A86-22311
Velocity and temperature decay characteristics of inverted-profile jets
[AIAA PAPER 86-0312] p 206 A86-22693

**JET FLOW**
Analysis of interacting dual lifting ejector systems
[AIAA PAPER 86-0478] p 233 A86-19895
Velocity and temperature decay characteristics of inverted-profile jets
[AIAA PAPER 86-0312] p 206 A86-22693
Dual rectangular jets from a flat plate in a crossflow
[AIAA PAPER 86-0477] p 255 A86-22703
Acoustic evaluation of the German-Dutch Wind Tunnel (DNW) shear layer correction using a model jet
[DNW-TR-82-04] p 242 N86-16237

**JET IMPINGEMENT**
Numerical simulation of impinging jets
[AIAA PAPER 86-0279] p 200 A86-19789

**JET THRUST**
F-14A low altitude, low airspeed, high angle of attack asymmetric thrust flight test program
p 222 A86-21053

**JETTISON SYSTEMS**
The use of TLX energy transfer lines on the F-16 aircraft — Thin Layer eXplosive p 243 A86-19313

**JETTISONING**
A predictive technique for determining store motion after release from a carrier vehicle at supersonic speeds
[AIAA PAPER 86-0586] p 203 A86-19964

**JOINTS (JUNCTIONS)**
Effect of manufacturing defects and service-induced damage on the strength of aircraft composite structures
p 245 A86-21729

## K

**.KALMAN FILTERS**
Markov jump-diffussion models and decision-making free filtering — air traffic control
[NLR-MP-83067-U] p 264 N86-17046
Comparison of a jump-diffusion tracker with a Kalman tracker: An evaluation with emphasis on air traffic control
[NLR-TR-83063-U] p 216 N86-17335
An efficient filter for abruptly changing systems
[NLR-MP-84071-U] p 264 N86-18056

**KARMAN VORTEX STREET**
Fluid dynamics of cylinder response to Karman vortex shedding
[AIAA PAPER 86-0119] p 199 A86-19700
Sound excitation during vortex-airfoil interaction
[MPIS-MITT-80] p 266 N86-18130

**KEVLAR (TRADEMARK)**
Application of Kevlar to parachute system design
p 214 A86-20166
Applications of tubular composite structures
p 245 A86-21719

## L

**LAMINAR BOUNDARY LAYER**
Aircraft viscous drag reduction technology
p 204 A86-20124
Investigation of the development of laminar boundary-layer instabilities along a sharp cone
[AD-A159370] p 255 N86-16521

**LAMINAR FLOW**
Design of a natural laminar flow wing for a transonic corporate transport
[AIAA PAPER 86-0314] p 200 A86-19807
A review and analysis of boundary layer transition data for turbine application
[ASME PAPER 85-GT-83] p 251 A86-22054
Numerical solution of viscous compressible flows past an airfoil using unconditionally stable explicit method
p 210 N86-17290

**LAMINATES**
Thermographic inspection of carbon epoxy structures
p 249 A86-20649
Requirements for tailoring of material properties of viscoelastically damped bonded laminates in aircraft structures p 250 A86-21714

**LAND MOBILE SATELLITE SERVICE**
A shared satellite system would satisfy many future aviation needs p 249 A86-20921

**LANDING GEAR**
Estimation of load exceedances of an aircraft under carriage with nonlinear properties excited by random runway unevenness
[NLR-TR-84030-U] p 228 N86-17348

**LANDING LOADS**
Estimation of load exceedances of an aircraft under carriage with nonlinear properties excited by random runway unevenness
[NLR-TR-84030-U] p 228 N86-17348

**LANDING SIMULATION**
Simulator evaluation of a remotely piloted vehicle visual landing task p 221 A86-20238

**LAP JOINTS**
Fatigue rated fastener systems in aluminum alloy structural joints — aircraft structures
[NLR-MP-83045-U] p 259 N86-17809

**LAPLACE EQUATION**
Measurements of rotating bubble shapes in low-gravity environment p 251 A86-21996

**LASER APPLICATIONS**
Laser systems for use with airborne platforms
p 228 A86-19571

**LASER DOPPLER VELOCIMETERS**
An experimental investigation of propeller wakes using a laser Doppler velocimeter
[AIAA PAPER 86-0080] p 232 A86-19677

**LASER GYROSCOPES**
Construction of a measuring method using fiber optics and an LTN-90 laser gyro strapdown system for BO-195 helicopters
[DFVLR-MITT-85-10] p 216 N86-17333

**LATERAL CONTROL**
Use of differential leading edge flaps for lateral control at high angle of attack
[AIAA PAPER 86-0168] p 238 A86-19729
Simulator evaluation of a remotely piloted vehicle visual landing task p 221 A86-20238

**LATERAL STABILITY**
Influence of wing tip configuration on lateral blowing efficiency
[AIAA PAPER 86-0475] p 206 A86-22702

**LEADING EDGE FLAPS**
Use of differential leading edge flaps for lateral control at high angle of attack
[AIAA PAPER 86-0168] p 238 A86-19729
An evaluation of leading-edge flap performance on delta and double-delta wings at supersonic speeds
[AIAA PAPER 86-0315] p 201 A86-19808

**LEADING EDGES**
Visualization and flow surveys of the leading edge vortex structure on delta wing planforms
[AIAA PAPER 86-0330] p 201 A86-19817
Comparison of computations and experimental data for leading edge vortices - Effects of yaw and vortex flaps
[AIAA PAPER 86-0439] p 202 A86-19880
Development of a design model for airfoil leading edge film cooling
[ASME PAPER 85-GT-120] p 252 A86-22073
An experimental investigation of the entrainment into a leading-edge vortex
[VTH-LR-332] p 208 N86-16203
Numerical simulation of the leading-edge separation vortex over delta wing p 209 N86-17271

**LEAKAGE**
The effect of water ingress on buoyancy and thermal quality of survival suits p 261 A86-19333

**LEE WAVES**
An extreme clear air turbulence incidence associated with a strong downslope windstorm
[AIAA PAPER 86-0329] p 259 A86-19816

**LEGAL LIABILITY**
Systems safety: Phantom or reality
[SNIAS-852-422-103] p 215 N86-17330

**LIFE (DURABILITY)**
A scientific method for determining the useful life of explosive devices in aircraft p 243 A86-19312
Problems found when introducing new materials — aircraft industry
[SNIAS-852-551-101] p 198 N86-16190
An analysis of rig test disc failures
[PNR-90276] p 237 N86-16224

**LIFE CYCLE COSTS**
Impact of composite materials on advanced fighters
p 245 A86-21722
Life cycle cost and availability in military aeronautics
p 266 A86-21872
The Air Force approach to environmental stress screening p 253 A86-22192
Small propulsion engine LCC considerations
p 267 A86-22399

**LIFE SUPPORT SYSTEMS**
SAFE Association, Annual Symposium, 22nd, Las Vegas, NV, December 9-13, 1984, Proceedings
p 212 A86-19301
U.S. Navy ALSS corporate report 1984
p 261 A86-19309
Altitude and acceleration protection system for high performance aircraft p 217 A86-19314
Accident investigation as a way of assessing aviation life support system performance p 212 A86-19323
Pilot underwater high pressure emergency breathing system p 261 A86-19343

**LIFT**
An experimental investigation of an airfoil pitching at moderate to high rates to large angles of attack
[AIAA PAPER 86-0008] p 198 A86-19631
Computation of dynamic stall of NACA0012 airfoil by block pentadiagonal matrix scheme
[AIAA PAPER 86-0116] p 199 A86-19697
Lift-curve characteristics for an airfoil pitching at constant rate
[AIAA PAPER 86-0117] p 199 A86-19698
Low speed aerodynamic characteristics of a two-dimensional sail wing with adjustable slack of the sail
[VTH-LR-307] p 211 N86-17314

**LIFT AUGMENTATION**
Vortices produced by air pulse injection from the surface of an oscillating airfoil
[AIAA PAPER 86-0118] p 199 A86-19699
Lift augmentation via spanwise tip blowing - A numerical study
[AIAA PAPER 86-0474] p 202 A86-19893
Influence of wing tip configuration on lateral blowing efficiency
[AIAA PAPER 86-0475] p 206 A86-22702

**LIFT DEVICES**
Development of pneumatic thrust-deflecting powered-lift systems
[AIAA PAPER 86-0476] p 219 A86-19894
Investigations on efficient numerical method for subsonic lifting surfaces p 209 N86-17285
Application of a constrained inverse method in the aerodynamic design of a low speed wing-slat configuration
[NLR-TR-83123-U] p 211 N86-17320
A system for computer aided analysis and design of multielement airfoils: MAD
[NLR-TR-83136-U] p 212 N86-17321

**LIFTING BODIES**
Investigations on efficient numerical method for subsonic lifting surfaces p 209 N86-17285

**LIGHT AIRCRAFT**
Laboratory study of the effects of sidewall treatment, source directivity and temperature on the interior noise of a light aircraft fuselage
[AIAA PAPER 86-0390] p 219 A86-19851
The evolution of reciprocating engines at Lycoming
p 267 A86-22135

**LIGHTNING**
Description of and results from camera systems for recording daytime lightning strikes to an airplane in flight
[AIAA PAPER 84-0020] p 230 A86-19636

**LIGHTNING SUPPRESSION**
Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes
[AIAA PAPER 86-0021] p 213 A86-19637
The lightning threat to aerospace vehicles
p 214 A86-20162

**LIMBS (ANATOMY)**
Limb Restraint Evaluator (LRE) p 261 A86-19329

**LINEAR SYSTEMS**
Linear-quadratic Gaussian with loop-transfer recovery methodology for the F-100 engine p 233 A86-20233
Maximum-likelihood estimation of parameters in linear systems from flight test data. A FORTRAN program
[ESA-TT-896] p 264 N86-16989

**LINEARIZATION**
A parallel quasi-linearization algorithm for air vehicle trajectory optimization
[AIAA PAPER 85-0498] p 243 A86-20244

**LIQUID FUELS**
Liquid fueled supersonic combustion ramjets - A research perspective of the past, present and future [AIAA PAPER 86-0158] p 236 A86-22679

**LISP (PROGRAMMING LANGUAGE)**
Development of a knowledge acquisition tool for an expert system flight status monitor [AIAA PAPER 86-0240] p 230 A86-19764

**LITHIUM ALLOYS**
Problems found when introducing new materials --- aircraft industry [SNIAS-852-551-101] p 198 N86-16190

**LOAD TESTS**
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 1: Background and fatigue evaluation [RAE-TR-84084] p 226 N86-17336
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 2: Final definition of Helix and Felix [RAE-TR-84085] p 226 N86-17337

**LOADS (FORCES)**
Stress analysis of 27% scale model of AH-64 main rotor hub [NASA-TM-87625] p 256 N86-16613

**LOGIC DESIGN**
Control law and logic development for controllable ejection seat catapult p 218 A86-19320

**LONG TERM EFFECTS**
Long term deposit formation in aviation turbine fuel at elevated temperature [AIAA PAPER 86-0525] p 243 A86-19929

**LONGITUDINAL STABILITY**
Flight stability and controllability. II - Aircraft longitudinal stability --- Serbo-Croation book p 239 A86-21318

**LOW ALTITUDE**
Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes [AIAA PAPER 86-0021] p 213 A86-19637
F-14A low altitude, low airspeed, high angle of attack asymmetric thrust flight test program p 222 A86-21053
Terrain following avoidance technique of very low altitude penetration p 239 A86-22309

**LOW ASPECT RATIO WINGS**
Lift augmentation via spanwise tip blowing - A numerical study [AIAA PAPER 86-0474] p 202 A86-19893
Numerical simulation of transonic separated flows over low-aspect ratio wings [AIAA PAPER 86-0508] p 206 A86-22704

**LOW COST**
The new 'dual stage' test procedure for low cost measurement of parachute performance p 240 A86-19324

**LOW REYNOLDS NUMBER**
Acoustic and turbulence influences on stall hysteresis [AIAA PAPER 86-0170] p 200 A86-19731
Vortex roll-up for an elliptically-loaded wing at moderately low Reynolds numbers [AIAA PAPER 86-0562] p 203 A86-19951

**LOW SPEED**
Low speed aerodynamic characteristics of a two-dimensional sail wing with adjustable slack of the sail [VTH-LR-307] p 211 N86-17314

**LOW SPEED WIND TUNNELS**
Aeroacoustic calibration of the German-Dutch Wind Tunnel (DNW) open jet [DNW-TR-82-03] p 242 N86-16236
Acoustic evaluation of the German-Dutch Wind Tunnel (DNW) shear layer correction using a model jet [DNW-TR-82-04] p 242 N86-16237
Aerodynamical calibration of the German-Dutch Wind Tunnel (DNW): A review of testing techniques and results [DNW-PA-82062] p 242 N86-16238
Activities report in aerospace research, with data concerning the scientific committee NLR-NIVR, international cooperation concerning AGARD, DNW, GARTEUR and cooperation with Indonesia p 257 N86-17588

**LUBRICATION**
Lubrication and performance of high-speed rolling-element bearings p 248 A86-19375

**M**

**MACH NUMBER**
Progress in the Lewis Research Center Altitude Wind Tunnel (AWT) Modeling Program [NASA-TM-87134] p 242 N86-16233
Supersonic aerodynamic characteristics of some reentry concepts for angles of attack to 90 deg [NASA-TM-87645] p 243 N86-16243

**MAINTAINABILITY**
AV-8B design for maintainability p 225 A86-22378
Relating factory and field reliability and maintainability measures p 253 A86-22391
Support effectiveness evaluation model --- for military air facilities in sortie generation p 263 A86-22398
A multiple-parameter allocation process p 25[illegible] A86-22407

**MAINTENANCE**
Introduction to deployable recovery systems [DE86-000048] p 211 N86-17310

**MALFUNCTIONS**
Using Fleet reported 3-M data in support of Navy emergency escape parachute assemblies p 212 A86-19326

**MAN MACHINE SYSTEMS**
Development of mechanical components for advanced aircrew seating systems p 217 A86-19307

**MANAGEMENT METHODS**
Aviation maintenance management --- Book p 197 A86-21055

**MANUFACTURING**
Unique tooling and manufacturing approach for large advanced composite aircraft structure p 246 A86-21742
Design of nonaxysymmetric structures (turbojet engine nacelle element) [SNIAS-852-430-119] p 248 N86-17498

**MAP MATCHING GUIDANCE**
Towards robust image matching algorithms p 230 A86-19620

**MARINE ENVIRONMENTS**
AV-8B initial sea trials p 222 A86-21054

**MARKETING**
F-20A Tigershark progress report p 222 A86-21057
A Synthetic Aperture Radar (SAR) for commercial applications p 250 A86-21246

**MARKOV CHAINS**
An efficient filter for abruptly changing systems [NLR-MP-84071-U] p 264 N86-18056

**MARKOV PROCESSES**
Markov jump-diffussion models and decision-making free filtering --- air traffic control [NLR-MP-83067-U] p 264 N86-17046
A sophisticated tracking algorithm for Air Traffic Control (ATC) surveillance radar data [NLR-MP-84004-U] p 216 N86-17334
Comparison of a jump-diffusion tracker with a Kalman tracker: An evaluation with emphasis on air traffic control [NLR-TR-83063-U] p 216 N86-17335

**MASKS**
Protective respirator for the AAH-64 Advanced Attack Helicopter p 261 A86-19336

**MASS DISTRIBUTION**
Mass balancing of hollow fan blades [NASA-TM-87197] p 255 N86-16611

**MASS FLOW RATE**
Quantitative determination of engine water ingestion [AIAA PAPER 86-0307] p 254 A86-22690

**MATERIALS SCIENCE**
National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings p 244 A86-21701

**MATHEMATICAL MODELS**
Modeling aerodynamic responses to aircraft maneuvers - A numerical validation p 204 A86-20156
A numerical model of acoustic choking. II - Shocked solutions p 265 A86-20795
A numerical simulation of the inviscid flow through a counter-rotating propeller [NASA-TM-87200] p 207 N86-16195
Multivariable control [OUEL-1589/85] p 264 N86-17007
Investigations on efficient numerical method for subsonic lifting surfaces p 209 N86-17285
Strategies for dynamic modeling of a helicopter structure [SNIAS-852-210-101] p 228 N86-17350
Effect of dynamic stall and elastic parameters on the fundamental mechanisms of helicopter vibrations [AD-A160022] p 237 N86-17355
Sound excitation during vortex-airfoil interaction [MPIS-MITT-80] p 266 N86-18130

**MATRIX METHODS**
The automated, advanced matrix FMEA technique --- Failure Modes and Effects Analysis p 253 A86-22382

**MAXIMUM LIKELIHOOD ESTIMATES**
Maximum-likelihood estimation of parameters in linear systems from flight test data. A FORTRAN program [ESA-TT-896] p 264 N86-16989

**MCDONNELL DOUGLAS AIRCRAFT**
Designing an airlifter - McDonnell Douglas's C-17 p 224 A86-21897

**MECHANICAL PROPERTIES**
Recent developments in carbon fibre composite p 244 A86-21296
The material development, component manufacture, and post-service evaluation of RB211-524 cowl doors utilizing carbon fibre composite materials [PNR-90275] p 247 N86-16273

**MEDICAL SERVICES**
Airport preparedness for mass disaster - A proposed schematic plan p 214 A86-20411

**METALS**
Repeatability of mixed-mode adhesive debonding p 249 A86-20638
National SAMPE Technical Conference, 17th, Kiamesha Lake, NY, October 22-24, 1985, Proceedings p 244 A86-21701

**METEOROLOGICAL PARAMETERS**
Meteorological factors in selected aircraft accident investigations [AIAA PAPER 86-0324] p 213 A86-19814

**METHOD OF CHARACTERISTICS**
Calculation of supersonic flows around a three-dimensional wing and a waisted body with characteristic method in stream surface coordinates p 206 A86-22319

**MICROBIOLOGY**
AGARD Corrosion Handbook. Volume 1: Corrosion, causes and case histories [AGARD-AG-278-VOL-1] p 248 N86-16374

**MICROPHONES**
A new application of adaptive noise cancellation --- in acoustic barriers p 262 A86-22626

**MICROPROCESSORS**
A microprocesor sequencer for the advanced Navy ejection seat p 218 A86-19331
Computer controlled operation of reconnaissance cameras p 229 A86-19587
Comparison of performance characteristics of DDC algorithms implemented on a microprocessor --- Direct Digital Control p 263 A86-20518

**MICROSTRUCTURE**
Cast aluminum fatigue property/microstructure relationships p 244 A86-21707

**MICROWAVE LANDING SYSTEMS**
FINDS: A fault inferring nonlinear detection system programmers manual, version 3.0 [NASA-CR-177986] p 231 N86-16212

**MIDAIR COLLISIONS**
Aircraft accident report: Midair collision of Wings West Airlines Beech C-99 (N666U) and Aesthetec Inc., Rockwell Commander (N112SM), near San Luis Obispo, California, August 24, 1984 [NTSB/AAR-85/07] p 214 N86-16207

**MILITARY AIR FACILITIES**
Support effectiveness evaluation model --- for military air facilities in sortie generation p 263 A86-22398

**MILITARY AIRCRAFT**
U.S. Navy ALSS corporate report 1984 p 261 A86-19309
Controllable ejection seat catapult program p 218 A86-19339
Investigation of aircraft departure susceptibility using a total-G simulator [AIAA PAPER 86-0492] p 238 A86-19903
A high bandwidth signal distribution system for aircraft Stores Management Systems (SMS) p 231 A86-20505
Life cycle cost and availability in military aeronautics p 266 A86-21872
Designing an airlifter - McDonnell Douglas's C-17 p 224 A86-21897
Is there life after 10,000 flight hours? p 254 A86-22402

**MILITARY HELICOPTERS**
Laboratory and flight testing of ballistic protective headgear for rotary wing aircrew p 261 A86-19344

**MILITARY OPERATIONS**
Support effectiveness evaluation model --- for military air facilities in sortie generation p 263 A86-22398

**MILITARY TECHNOLOGY**
XB-70 structures and materials advancements p 224 A86-22131

**MINICOMPUTERS**
Error propagation in a digital avionic processor: A simulation-based study [NASA-CR-176501] p 232 N86-17351

**MIRAGE AIRCRAFT**
A case study in fatigue life extension - The main spar of RAAF Mirage IIIO wings p 225 A86-22165

**MIRAGE 3 AIRCRAFT**
Canard Mirage on test p 225 A86-22261

**MISALIGNMENT**
Calculation of misalignment error of multi-joint holes of wing to fuselage p 253 A86-22318

**MISSILE SYSTEMS**
Evolution and status of CFD techniques for scramjet applications
[AIAA PAPER 86-0160] p 248 A86-19970
**MISSILE TESTS**
Old fighters - New targets p 225 A86-22262
**MISSILES**
Small propulsion engine LCC considerations
p 267 A86-22399
**MODAL RESPONSE**
Recursive instrumental variable algorithms for modal parameter estimation of structural system
p 263 A86-22306
**MODELS**
Progress in the Lewis Research Center Altitude Wind Tunnel (AWT) Modeling Program
[NASA-TM-87194] p 242 N86-16233
**MODULATION**
Control methodology for stochastic system characteristics modulation
[AIAA PAPER 86-0335] p 262 A86-19821
**MODULES**
F-111 escape systems - Today's module technology
p 217 A86-19311
**MODULUS OF ELASTICITY**
The Shock and Vibration Bulletin 55. Part 1: Welcome, keynote address, invited papers, isolation and damping and damping practices
[AD-A160263] p 256 N86-16616
A different approach to designed in passive damping
p 256 N86-16627
**MOLDING MATERIALS**
Arenyl: A soluble mold technology
[SNIAS-852-430-111] p 247 N86-16277
**MOLDS**
Advances in P/M titanium shape technology using the ceramic mold process p 246 A86-21741
Arenyl: A soluble mold technology
[SNIAS-852-430-111] p 247 N86-16277
Study of composite material curing molds
[DGT-26.817] p 248 N86-17486
**MONITORS**
Helicopter fatigue monitoring using a single channel recorder p 220 A86-20038
**MONTE CARLO METHOD**
An analysis of rig test disc failures
[PNR-90276] p 237 N86-16224
**MOTION SIMULATORS**
Simulation of a six degrees of freedom flight simulator motion system
[UA-00-39] p 241 N86-16230
**MTBF**
Analysis of the F/A-18 Hornet flight control computer field mean time between failure p 231 A86-22386
**MULTISPECTRAL BAND SCANNERS**
Development of an airborne CCD scanner for land and sea applications p 231 A86-21163
**MUSEUMS**
Air and space flight. Dream and facts
[MBB-FILM-382] p 198 N86-16188

## N

**NACELLES**
Conformal mapping as an aid in grid generation for complex three-dimensional configurations
[AIAA PAPER 86-0497] p 203 A86-19906
Aerodynamic characteristics of a high-wing transport configuration with a over-the-wing nacelle-pylon arrangement
[NASA-TP-2497] p 207 N86-16193
**NASA PROGRAMS**
The role of a real-time flight support facility in flight research programs
[AIAA PAPER 86-0166] p 241 A86-19727
Spanwise turbulence effects on aircraft response
[AIAA PAPER 86-0255] p 200 A86-19774
**NATURAL LANGUAGE (COMPUTERS)**
Using a menu-based natural language interface to ask spatial database queries p 259 A86-20665
Understanding natural language commands
p 263 A86-20667
**NAVIER-STOKES EQUATION**
The computation of steady 3-D separated flows over aerodynamic bodies at incidence and yaw
[AIAA PAPER 86-0109] p 199 A86-19693
Three-dimensional body-fitting grid system for a complete aircraft
[AIAA PAPER 86-0426] p 201 A86-19670
Practical applications of new LU-ADI scheme for the three-dimensional Navier-Stokes computation of transonic viscous flows
[AIAA PAPER 86-0513] p 209 A86-19922
A three-dimensional viscous flow analysis for the helicopter tip vortex generation process about square and round tipped blades
[AIAA PAPER 86-0560] p 203 A86-19949
Simulation of diffuser duct flowfields using a three-dimensional Euler/Navier-Stokes algorithm
[AIAA PAPER 86-0310] p 206 A86-22692
Numerical simulation of the leading-edge separation vortex over delta wing p 209 N86-17271
Numerical simulation of unsteady flow around an airfoil by finite difference solution of Navier-Stokes equations
p 209 N86-17273
Numerical analysis about flow over an aerofoil with a large angle of attack p 210 N86-17291
Numerical analysis of transonic flow around two-dimensional airfoil by solving Navier-Stokes equations p 210 N86-17292
Analysis of high Reynolds number transonic flow around an airfoil p 210 N86-17293
**NAVIGATION AIDS**
Search and Rescue (SAR) System developed as part of the contract signed with the Irish Air Corps for the supply of 365 F Dauphin aircraft
[SNIAS-852-210-105] p 215 N86-17329
**NAVIGATION INSTRUMENTS**
Construction of a measuring method using fiber optics and an LTN-90 laser gyro strapdown system for BO-105 helicopters
[DFVLR-MITT-85-10] p 216 N86-17333
**NETHERLANDS**
Aeroacoustic research in the Netherlands related to aircraft development
[NLR-MP-84049-U] p 265 N86-17081
Noise assessment around Schiphol airport (the Netherlands) in 1981
[NLR-TR-82034-U] p 260 N86-17915
**NICKEL ALLOYS**
High strength nickel-palladium-chromium brazing alloys p 244 A86-20579
**NOISE MEASUREMENT**
The effect of acoustic reflections on combustor noise measurements p 265 A86-20364
Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance: Preliminary results
[NASA-TM-87637] p 265 N86-17077
Helicopter internal noise treatment. Recent methodoigies and practical applications
[SNIAS-852-210-102] p 266 N86-18133
**NOISE POLLUTION**
Report of the Working Group for Sensitivity Analysis and Zoning Calculations (GAZOB) p 259 N86-16749
Analysis and conclusions of the working Group for Sensitivity Analysis and Zoning Calculations (GAZOB)
p 259 N86-16750
Noise nuisance calculations for Schiphol Airport on behalf of the Sensitivity Analysis and Zoning Calculations Working Group (GAZOB)
[NLR-TR-85034-U] p 260 N86-16751
Noise assessment around Schiphol airport (the Netherlands) in 1981
[NLR-TR-82034-U] p 260 N86-17915
**NOISE PREDICTION**
Analysis of the noise emitted by a tail rotor
p 266 N86-18129
**NOISE PREDICTION (AIRCRAFT)**
Laboratory study of cabin acoustic treatments installed in an aircraft fuselage p 221 A86-20158
Report of the Working Group for Sensitivity Analysis and Zoning Calculations (GAZOB) p 259 N86-16749
Analysis and conclusions of the working Group for Sensitivity Analysis and Zoning Calculations (GAZOB)
p 259 N86-16750
Noise nuisance calculations for Schiphol Airport on behalf of the Sensitivity Analysis and Zoning Calculations Working Group (GAZOB)
[NLR-TR-85034-U] p 260 N86-16751
Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance. Preliminary results
[NASA-TM-87637] p 265 N86-17077
Seperation of airborne and structureborne noise radiated by plates constructed of conventional and composite materials with applications for prediction of interior noise paths in propeller driven aircraft
[NASA-TM-87414] p 265 N86-18121
**NOISE REDUCTION**
Laboratory study of the effects of sidewall treatment, source directivity and temperature on the interior noise of a light aircraft fuselage
[AIAA PAPER 86-0390] p 219 A86-19851
Laboratory study of cabin acoustic treatments installed in an aircraft fuselage p 221 A86-20158
A new application of adaptive noise cancellation — in acoustic barriers p 262 A86-22626
Analysis and conclusions of the working Group for Sensitivity Analysis and Zoning Calculations (GAZOB)
p 259 N86-16750
Aircraft noise control: Prospects for the 21st century
[PNR-90272] p 260 N86-16757
Noise reduction technology
[GPO-48-026] p 265 N86-17076
Application of active noise reduction for hearing protection and speech intelligibility improvement
[IZF-1985-7] p 266 N86-18131
Helicopter internal noise treatment. Recent methodoigies and practical applications
[SNIAS-852-210-102] p 266 N86-18133
**NOISE SPECTRA**
Analysis of the noise emitted by a tail rotor
p 266 N86-18129
**NONDESTRUCTIVE TESTS**
Thermographic inspection of carbon epoxy structures
p 249 A86-20549
Nondestructive inspection: An efficient investment — composite materials
[SNIAS-852-430-110] p 247 N86-16276
Description of a nondestructive facility using holographic interferometry
[SNIAS-852-430-105] p 258 N86-17726
Quadrinomial distribution for the characterization of nondestructive inspection (NDI) reliability
[NLR-MP-84064-U] p 258 N86-17774
**NONLINEAR FILTERS**
Markov jump-diffusion models and decision-making free filtering — air traffic control
[NLR-MP-83067-U] p 264 N86-17046
A sophisticated tracking algorithm for Air Traffic Control (ATC) surveillance radar data
[NLR-MP-84004-U] p 216 N86-17334
An efficient filter for abruptly changing systems
[NLR-MP-84071-U] p 264 N86-18056
**NONLINEARITY**
FINDS: A fault inferring nonlinear detection system programmers manual, version 3.0
[NASA-CR-177986] p 231 N86-16212
**NOTCH STRENGTH**
Fatigue life prediction under complex load using local strain approach and relative Miner's rule
p 249 A86-20173
**NOZZLE DESIGN**
Performance of a forward swept wing fighter utilizing thrust vectoring and reversing p 221 A86-20163
Velocity and temperature decay characteristics of inverted-profile jets
[AIAA PAPER 86-0312] p 206 A86-22693
Hot Gas Laboratory twin nozzle calibration
[BAE-ARG-200] p 258 N86-17666
**NOZZLE FLOW**
An eleven parameter axial turbine airfoil geometry model
[ASME PAPER 85-GT-219] p 205 A86-22117
Numerical solution of 2-D thrust reversing and thrust vectoring nozzle
[AIAA PAPER 86-0203] p 254 A86-22681
Hot Gas Laboratory twin nozzle calibration
[BAE-ARG-200] p 258 N86-17666
**NOZZLE GEOMETRY**
Hot Gas Laboratory twin nozzle calibration
[BAE-ARG-200] p 258 N86-17666
**NOZZLE THRUST COEFFICIENTS**
Numerical solution of 2-D thrust reversing and thrust vectoring nozzle
[AIAA PAPER 86-0203] p 254 A86-22681
**NUMERICAL CONTROL**
Computer controlled operation of reconnaissance cameras p 229 A86-19587
Comparison of performance characteristics of DDC algorithms implemented on a microprocessor — Direct Digital Control p 263 A86-20518
**NUMERICAL FLOW VISUALIZATION**
Numerical simulation of impinging jets
[AIAA PAPER 86-0279] p 200 A86-19789
Numerical simulation of the transonic flowfield for wing/nacelle configurations p 204 A86-20159

## O

**OBSTACLE AVOIDANCE**
Terrain following avoidance technique of very low altitude penetration p 239 A86-22309
**OIL SLICKS**
United States Coast Guard acquisition of remote sensing capability for ocean surveillance p 231 A86-21234
**ONBOARD DATA PROCESSING**
Local area command/control networks: The design of an on-board network - ANTINEA — French thesis
p 215 A86-21327

**ONBOARD EQUIPMENT**
Search and Rescue (SAR) System developed as part of the contract signed with the Irish Air Corps for the supply of 365 F Dauphin aircraft
[SNIAS-852-210-105] p 215 N86-17329
**OPTICAL EQUIPMENT**
Application of biocular viewers to airborne reconnaissance p 229 A86-19580
**OPTICAL GYROSCOPES**
Symposium Gyro Technology 1984; Proceedings of the Symposium, Universitaet Stuttgart, West Germany, September 11, 12, 1984 p 250 A86-21826
**OPTIMAL CONTROL**
Endurance increase by cyclic control — of aircraft
p 221 A86-20235
Aircraft terminal area guidance based on the discrete tracking problem of optimal control theory
p 215 A86-20520
**OPTIMIZATION**
Requirements for tailoring of material properties of viscoelastically damped bonded laminates in aircraft structures p 250 A86-21714
Optimization in design processes: An informatics point of view
[NLR-MP-84074-U] p 228 N86-17349
**OXIDATION**
The quantification and improvement of the thermal stability of aviation turbine fuel
[ASME PAPER 85-GT-33] p 247 A86-22022

## P

**P-3 AIRCRAFT**
The anatomy of sea SKAD (Survival Kit Air Droppable) - A Canadian Forces/industry development program
p 213 A86-19335
**PACKET SWITCHING**
Airborne communications reconstitution experiments
p 251 A86-21891
**PALLADIUM ALLOYS**
High strength nickel-palladium-chromium brazing alloys p 244 A86-20579
**PALMGREN-MINER RULE**
Fatigue life prediction under complex load using local strain approach and relative Miner's rule
p 249 A86-20173
**PANEL FLUTTER**
The Shock and Vibration Bulletin 55. Part 1: Welcome, keynote address, invited papers, isolation and damping and damping practices
[AD-A160263] p 256 N86-16616
**PANEL METHOD (FLUID DYNAMICS)**
Evaluation of methods for predicting complex aircraft flowfields
[AIAA PAPER 86-0396] p 201 A86-19655
A transonic rectangular grid embedded panel method
p 204 A86-20953
Application of time-linearized methods of oscillating wings in transonic flow and flutter
[NLR-MP-84077-U] p 208 N86-16204
**PANELS**
Design of hat-stiffened composite panels under uniaxial compression and shear. Minimum mass optimization based on a simplified theory
[VTH-LR-312] p 259 N86-17806
**PARACHUTE DESCENT**
Introduction to deployable recovery systems
[DE86-000048] p 211 N86-17310
**PARACHUTE FABRICS**
Application of Kevlar to parachute system design
p 214 A86-20166
**PARACHUTES**
A Single Point Release System for the Advanced Concept Ejection Seat (ACES) II - Survival kit and parachute risers p 217 A86-19303
Aircrew escape system models used in wind tunnel tests p 217 A86-19316
Ballistically deployed parachute systems for single and two place aircraft p 212 A86-19319
The new 'dual stage' test procedure for low cost measurement of parachute performance
p 240 A86-19324
Using Fleet reported 3-M data in support of Navy emergency escape parachute assemblies
p 212 A86-19326
A philosophical basis for the use of high-performance, gliding parachutes in ejection seat aircraft
p 213 A86-19352
Compensating-slit canopy design - A new low-speed/high-speed parachute p 213 A86-19353
Introduction to deployable recovery systems
[DE86-000048] p 211 N86-17310
**PARALLEL FLOW**
Isolated and interacting round parallel heated jets
[AIAA PAPER 86-0281] p 264 A86-19790
Analysis of interacting dual lifting ejector systems
[AIAA PAPER 86-0476] p 233 A86-19895
**PARALLEL PROCESSING (COMPUTERS)**
A parallel quasi-linearization algorithm for air vehicle trajectory optimization
[AIAA PAPER 85-0496] p 243 A86-20244
**PARAMETER IDENTIFICATION**
Recursive instrumental variable algorithms for modal parameter estimation of structural system
p 263 A86-22306
Maximum-likelihood estimation of parameters in linear systems from flight test data. A FORTRAN program
[ESA-TT-896] p 264 N86-16989
**PARITY**
Robust detection-isolation-accommodation for sensor failures
[NASA-CR-174797] p 255 N86-16486
**PASSIVITY**
AGARD Corrosion Handbook. Volume 1: Corrosion, causes and case histories
[AGARD-AG-278-VOL-1] p 248 N86-16374
**PATHOLOGICAL EFFECTS**
USAF toxicology research on petroleum and shale-derived aviation gas turbine fuels
[ASME PAPER 85-GT-34] p 262 A86-22023
**PATTERN RECOGNITION**
Upsilon invariants - A uniform set of moment invariants p 262 A86-19608
Air targeting of the third kind - Airborne vehicles
p 230 A86-19617
**PAVEMENTS**
Surface properties-vehicle interaction
[PB85-242576] p 255 N86-16426
**PAYLOADS**
Introduction to deployable recovery systems
[DE86-000048] p 211 N86-17310
**PERFORMANCE PREDICTION**
Accident investigation as a way of assessing aviation life support system performance p 212 A86-19323
An analytical investigation of the effects of swirler design on the performance of annular propulsive nozzles
[AIAA PAPER 86-0587] p 233 A86-19965
**PERFORMANCE TESTS**
The new 'dual stage' test procedure for low cost measurement of parachute performance
p 240 A86-19324
Small scale wind tunnel testing of model propellers
[AIAA PAPER 86-0392] p 233 A86-19853
Application of Kevlar to parachute system design
p 214 A86-20166
AV-8B initial sea trials p 222 A86-21054
Progress report - F-16 C&D testing
p 222 A86-21056
Non-rigid airship testing p 223 A86-21059
Testing Canadian unique features of the CF-18 - The first year p 223 A86-21060
Escape systems testing p 223 A86-21063
Airborne communications reconstitution experiments
p 251 A86-21891
Operating experience in the Jeff (A) in the Arctic
[ASME PAPER 85-GT-127] p 266 A86-22076
The KC-135/CFM56 Re-Engine Program
[ASME PAPER 85-GT-211] p 224 A86-22112
F/A-18 Hornet - Reliability development testing
p 225 A86-22400
Stress level testing of electronics, avionics communications and C3I equipments
[AD-A159395] p 231 N86-16214
The application of sensors in light tests
[NLR-MP-84056-U] p 232 N86-17352
**PETROLEUM PRODUCTS**
USAF toxicology research on petroleum and shale-derived aviation gas turbine fuels
[ASME PAPER 85-GT-34] p 262 A86-22023
**PHOTOELASTIC ANALYSIS**
Measurement of elastic-plastic strain field at the curve surface crack tip p 249 A86-20175
**PHOTOGRAPHIC FILM**
KA-102 film/EO standoff system p 229 A86-19581
**PHOTORECONNAISSANCE**
Evolution of real time airborne reconnaissance
p 229 A86-19586
Computer controlled operation of reconnaissance cameras p 229 A86-19587
Automatic exposure control employing scene statistics in reconnaissance cameras p 230 A86-19588
Sensor control and film annotation for long range, standoff reconnaissance p 230 A86-19597
**PIEZOELECTRIC CRYSTALS**
Development of a piezoelectric quartz pressure sensor for avionics with excellent long term stability (with final demonstration of the results on a prototype)
[BMFT-FB-W-85-010] p 232 N86-17353
**PILOT ERROR**
Aircraft accident report: Midair collision of Wings West Airlines Beech C-99 (N666U) and Aesthetec Inc., Rockwell Commander (N112SM), near San Luis Obispo, California, August 24, 1984
[NTSB/AAR-85/07] p 214 N86-16207
**PILOT PERFORMANCE**
Evaluation of pilot performance and aircrew protective devices in a simulated F-14 flat spin environment
p 262 A86-19351
Flight dynamics and aircraft piloting
[ESA-TT-874] p 240 N86-16229
**PIPES (TUBES)**
Applications of tubular composite structures
p 245 A86-21719
**PITCH (INCLINATION)**
An experimental investigation of an airfoil pitching at moderate to high rates to large angles of attack
[AIAA PAPER 86-0008] p 198 A86-19631
**PLAN POSITION INDICATORS**
Evaluation of 23 inch radar viewing unit for Heathrow approach control room
[CAA-PAPER-85011] p 216 N86-16209
**PLANFORMS**
Multi-knot Boolean sum interpolating surface interactive design of aircraft configuration p 263 A86-22305
Supersonic aerodynamic characteristics of some reentry concepts for angles of attack to 90 deg
[NASA-TM-87645] p 243 N86-16243
**PLASTIC AIRCRAFT STRUCTURES**
Impact of composite materials on advanced fighters
p 245 A86-21722
**PLUMES**
Infrared emission from jet engine exhaust plumes
[AIAA PAPER 86-0465] p 233 A86-19888
**PNEUMATIC EQUIPMENT**
Development of an electro-pneumatic anti-G valve for high performance fighter aircraft p 218 A86-19317
Development of pneumatic thrust-deflecting powered-lift systems
[AIAA PAPER 86-0476] p 219 A86-19894
**POLLUTION MONITORING**
United States Coast Guard acquisition of remote sensing capability for ocean surveillance p 231 A86-21234
**POLLUTION TRANSPORT**
Dispersion process of jet engine exhaust plume. II - Buoyant jet p 234 A86-20448
**POLYMER CHEMISTRY**
Optically transparent silicone elastomers
p 244 A86-21710
**POLYNOMIALS**
Quadrinomial distribution for the characterization of nondestructive inspection (NDI) reliability
[NLR-MP-84064-U] p 258 N86-17774
**POLYVINYL ALCOHOL**
Arenyl: A soluble mold technology
[SNIAS-852-430-111] p 247 N86-16277
**POTENTIAL FLOW**
Steady and unsteady full potential calculation for large and small aspect ratio supercritical wings
[AIAA PAPER 86-0122] p 199 A86-19702
Implicit finite-difference methods for the calculation of unsteady transonic potential flow around two-dimensional airfoils: A discussion
[NLR-MP-83063-U] p 208 N86-16202
A survey of numerical methods for the calculation of inviscid, possibly rotational Euler flows around aeronautical configurations
[NLR-TR-83130-U] p 258 N86-17699
Boundary layer calculations on the leeward surface of a slender delta wing at incidence
[NLR-TR-84001-U] p 258 N86-17700
**POWDER METALLURGY**
Advances in P/M titanium shape technology using the ceramic mold process p 246 A86-21741
PM techniques for making near-net-shape titanium alloy components p 246 A86-21756
**POWERED LIFT AIRCRAFT**
Development of pneumatic thrust-deflecting powered-lift systems
[AIAA PAPER 86-0476] p 219 A86-19894
**PREDICTION ANALYSIS TECHNIQUES**
Evaluation of an aerodynamic-load prediction method on a STOL fighter configuration
[AIAA PAPER 86-0590] p 203 A86-19966
**PREMIXED FLAMES**
The two-fluid model of turbulent combustion applied to an idealised one-dimensional, unsteady, confined, pre-mixed flame
[PDR/CFDU/IC/21] p 247 N86-16315
**PREMIXING**
Evaluation of fuel preparation systems for lean premixing-prevaporizing combustors
[ASME PAPER 85-GT-137] p 235 A86-22081

**PREPARATION**
Airport preparedness for mass disaster - A proposed schematic plan p 214 A86-20411
**PREPREGS**
Evaluation of the Ciba-Geigy R6376 IM6 prepreg — fiber reinforced plastics
[DGT-26.649] p 248 N86-17485
**PRESSURE DISTRIBUTION**
Summary of a high subsonic force/pressure experiment for 58 deg cambered/twisted thick delta wings
[AIAA PAPER 86-0169] p 200 A86-19730
Calculation of supersonic flows around a three-dimensional wing and a waisted body with characteristic method in stream surface coordinates
p 206 A86-22319
Pressure distributions from high Reynolds number tests of a Boeing BAC 1 airfoil in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87600] p 208 N86-16199
**PRESSURE SENSORS**
Development of a piezoelectric quartz pressure sensor for avionics with excellent long term stability (with final demonstration of the results on a prototype)
[BMFT-FB-W-85-010] p 232 N86-17353
**PRIMERS (COATINGS)**
Electrodeposited primer scale-up and qualification
p 245 A86-21735
**PROBABILITY DISTRIBUTION FUNCTIONS**
Quadrinomial distribution for the characterization of nondestructive inspection (NDI) reliability
[NLR-MP-84064-U] p 258 N86-17774
**PRODUCT DEVELOPMENT**
Optically transparent silicone elastomers
p 244 A86-21710
The technical development of cooled gas turbine blades
[PNR-90292] p 255 N86-16595
**PRODUCTION ENGINEERING**
SF-340 airfoil structure - A unique approach
p 224 A86-21712
Titanium Near Net Shape components for demanding airframe applications p 245 A86-21726
**PROFILOMETERS**
Surface properties-vehicle interaction
[PB85-242576] p 255 N86-[illegible]6428
**PROJECTILES**
Six degree of freedom simulation of fluid payload projectiles using numerically computed fluid moments
[DE85-017163] p 208 N86-16200
**PROP-FAN TECHNOLOGY**
Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance: Preliminary results
[NASA-TM-87637] p 265 N86-17077
**PROPELLER BLADES**
Flow field survey near the rotational plane of an advanced design propeller on a JetStar airplane
[NASA-TM-86037] p 207 N86-16196
**PROPELLER DRIVE**
Environment-friendly propeller aircraft with a maximum weight of 5700 kg, and motor gliders: Publication of the noise values p 227 N86-17341
**PROPELLER EFFICIENCY**
An experimental investigation of propeller wakes using a laser Doppler velocimeter
[AIAA PAPER 86-0080] p 232 A86-19677
**PROPELLERS**
Propeller design by optimization
[AIAA PAPER 86-0081] p 232 A86-19678
Small scale wind tunnel testing of model propellers
[AIAA PAPER 86-0392] p 233 A86-19853
Mach number and flow-field calibration at the advanced design propeller location on the JetStar airplane
[NASA-TM-84923] p 207 N86-16197
**PROPULSION SYSTEM CONFIGURATIONS**
Progress in the Lewis Research Center Altitude Wind Tunnel (AWT) Modeling Program
[NASA-TM-87194] p 242 N86-16233
**PROPULSION SYSTEM PERFORMANCE**
Propeller design by optimization
[AIAA PAPER 86-0081] p 232 A86-19678
Small propulsion engine LCC considerations
p 267 A86-22399
**PROTECTIVE CLOTHING**
How much inherent buoyancy is acceptable in a helicopter passenger immersion suit
p 261 A86-19310
Altitude and acceleration protection system for high performance aircraft p 217 A86-19314
Development of an electro-pneumatic anti-G valve for high performance fighter aircraft p 218 A86-19317
Protective respirator for the AAH-64 Advanced Attack Helicopter p 261 A86-19336
Laboratory and flight testing of ballistic protective headgear for rotary wing aircrew p 261 A86-19344
**PROTECTIVE COATINGS**
Fuel resistant coatings for applications in integral tanks & bladder fuel cells p 246 A86-21737
**PROVING**
Validation of viscous and inviscid computational methods for turbomachinery components
[NASA-TM-87193] p 207 N86-16194
CERR: An aviation verification program
[PB85-204824] p 260 N86-16854
**PULSED LASERS**
Laser systems for use with airborne platforms
p 228 A86-19571
**PUSHBROOM SENSOR MODES**
KA-102 film/EO standoff system p 229 A86-19581
**PYLON MOUNTING**
Aerodynamic characteristics of a high-wing transport configuration with a over-the-wing nacelle-pylon arrangement
[NASA-TP-2497] p 207 N86-[illegible]93

# Q

**QUALIFICATIONS**
Is the traditional 150 hour endurance test outdated?
[PNR-90288] p 237 N86-16226
**QUALITY CONTROL**
The Air Force approach to environmental stress screening p 253 A86-22192
Nondestructive inspection: An efficient investment — composite materials
[SNIAS-852-430-110] p 247 N86-16276
AVIP Air Force thrust for reliability
p 256 N86-16617
Reliability aspects of software for digital avionics
[NLR-TR-82126-U] p 232 N86-17354
**QUARTZ TRANSDUCERS**
Development of a piezoelectric quartz pressure sensor for avionics with excellent long term stability (with final demonstration of the results on a prototype)
[BMFT-FB-W-85-010] p 232 N86-17353
**QUERY LANGUAGES**
Using a menu-based natural language interface to ask spatial database queries p 259 A86-20665

# R

**RADAR APPROACH CONTROL**
Evaluation of 23 inch radar viewing unit for Heathrow approach control room
[CAA-PAPER-85011] p 216 N86-16209
**RADAR BEACONS**
Evolution of the air traffic control beacon system
p 215 A86-21606
**RADAR TRACKING**
Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes
[AIAA PAPER 86-0021] p 213 A86-19637
Radars in air traffic control - A status report
p 216 A86-21607
Plessey displays in air traffic control
p 216 A86-21608
A sophisticated tracking algorithm for Air Traffic Control (ATC) surveillance radar data
[NLR-MP-84004-U] p 216 N86-17334
Comparison of a jump-diffusion tracker with a Kalman tracker: An evaluation with emphasis on air traffic control
[NLR-TR-83063-U] p 216 N86-17335
**RADIAL FLOW**
Transonic blade to blade calculations in an axial, radial or mixed flow cascade equipped with splitter blades
[ASME PAPER 85-GT-86] p 205 A86-22057
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation
[AD-A159312] p 237 N86-16222
**RADIO NAVIGATION**
Establishment and use of time unification system for civil aviation p 258 N86-17648
**RAIN**
Simulation and analysis of natural rain in a wind tunnel via digital image processing techniques
[AIAA PAPER 86-0291] p 241 A86-22687
**RANDOM LOADS**
Estimation of load exceedances of an aircraft under carriage with nonlinear properties excited by random runway unevenness
[NLR-TR-84030-U] p 228 N86-17348
**REACTION KINETICS**
Flame temperature estimation of conventional and future jet fuels
[ASME PAPER 85-GT-31] p 246 A86-22020
**REAL TIME OPERATION**
KA-102 film/EO standoff system p 229 A86-19581
KS-146A camera development and flight test results
p 229 A86-19583
Evolution of real time airborne reconnaissance
p 229 A86-19586
Computer controlled operation of reconnaissance cameras p 229 A86-19587
The role of a real-time flight support facility in flight research programs
[AIAA PAPER 86-0166] p 241 A86-19727
**REATTACHED FLOW**
Influence of excitation on coherent structures in reattaching turbulent shear layers
[AIAA PAPER 86-0112] p 199 A86-19696
**RECOVERY PARACHUTES**
Introduction to deployable recovery systems
[DE86-000046] p 211 N86-17310
**RECURSIVE FUNCTIONS**
Recursive instrumental variable algorithms for modal parameter estimation of structural system
p 263 A86-22306
**REDUCED GRAVITY**
Measurements of rotating bubble shapes in low-gravity environment p 251 A86-21996
**REDUNDANCY**
Robust detection-isolation-accommodation for sensor failures
[NASA-CR-174797] p 255 N86-16486
**REDUNDANT COMPONENTS**
A redundant strapdown reference for advanced aircraft flight control systems p 239 A86-21840
**REENTRY VEHICLES**
Supersonic aerodynamic characteristics of some reentry concepts for angles of attack to 90 deg
[NASA-TM-87645] p 243 N86-18243
**REFRACTORY MATERIALS**
Hot corrosion in aircraft engines
[ESA-TT-887] p 237 N86-16227
**REGIONAL PLANNING**
Report of the Working Group for Sensitivity Analysis and Zoning Calculations (GAZOB) p 259 N86-16749
Analysis and conclusions of the working Group for Sensitivity Analysis and Zoning Calculations (GAZOB)
p 259 N86-16750
Noise nuisance calculations for Schiphol Airport on behalf of the Sensitivity Analysis and Zoning Calculations Working Group (GAZOB)
[NLR-TR-85034-U] p 260 N86-16751
**REINFORCED PLATES**
A new method of analyzing wave propagation in periodic structures - Applications to periodic Timoshenko beams and stiffened plates p 249 A86-20792
**RELAXATION METHOD (MATHEMATICS)**
Numerical analysis for steady transonic flows past an airfoil using AF scheme p 209 N86-17289
**RELIABILITY**
Reliability aspects of software for digital avionics
[NLR-TR-82126-U] p 232 N86-17354
**RELIABILITY ANALYSIS**
The anatomy of sea SKAD (Survival Kit Air Droppable) - A Canadian Forces/industry development program
p 213 A86-19335
Finite element analysis of an ultralight aircraft
p 221 A86-20165
Life cycle cost and availability in military aeronautics
p 266 A86-21872
Implications of new aircraft avionics reliability performance p 253 A86-22178
Analysis of the F/A-18 Hornet flight control computer field mean time between failure p 231 A86-22386
Relating factory and field reliability and maintainability measures p 253 A86-22391
A decade of reliability testing progress
p 256 N86-16619
CERT: Where we have been, where we are going
p 256 N86-16620
**RELIABILITY ENGINEERING**
Linear-quadratic Gaussian with loop-transfer recovery methodology for the F-100 engine p 233 A86-20233
The automated, advanced matrix FMEA technique — Failure Modes and Effects Analysis p 253 A86-22382
F/A-18 Hornet - Reliability development testing
p 225 A86-22400
**REMOTE SENSING**
Development of an airborne CCD scanner for land and sea applications p 231 A86-21163
United States Coast Guard acquisition of remote sensing capability for ocean surveillance p 231 A86-21234
A Synthetic Aperture Radar (SAR) for commercial applications p 250 A86-21246
Spectroradiometric calibration of the Thematic Mapper and multispectral scanner system
[E86-10022] p 260 N86-17816
**REMOTELY PILOTED VEHICLES**
Simulator evaluation of a remotely piloted vehicle visual landing task p 221 A86-20238

Exploring the unknown with unmanned aircraft
p 225 A86-22263

**RESCUE OPERATIONS**
The anatomy of sea SKAD (Survival Kit Air Droppable) - A Canadian Forces/industry development program
p 213 A86-19335
Search and Rescue (SAR) System developed as part of the contract signed with the Irish Air Corps for the supply of 365 F Dauphin aircraft
[SNIAS-852-210-105] p 215 N86-17329

**RESEARCH AIRCRAFT**
Exploring the unknown with unmanned aircraft
p 225 A86-22263

**RESEARCH AND DEVELOPMENT**
Progress report - F-16 C&D testing
p 222 A86-21056
SF-340 airfoil structure - A unique approach
p 224 A86-21712
Liquid fueled supersonic combustion ramjets - A research perspective of the past, present and future
[AIAA PAPER 86-0158] p 236 A86-22679
Some comparisons of US and USSR aircraft design developments
[NASA-TM-87611] p 214 N86-16208

**RESEARCH FACILITIES**
Aeroacoustic research in the Netherlands related to aircraft development
[NLR-MP-84049-U] p 265 N86-17081

**RESPIRATORS**
Protective respirator for the AAH-64 Advanced Attack Helicopter p 261 A86-19336

**RETAINING**
Limb Restraint Evaluator (LRE) p 261 A86-19329

**RETROFITTING**
Re-engining the Harrier
[ASME PAPER 85-GT-175] p 235 A86-22091
The KC-135/CFM56 Re-Engine Program
[ASME PAPER 85-GT-211] p 224 A86-22112

**REVISIONS**
Bigger is better - Stretching the C-141 Starlifter
p 220 A86-20125

**REYNOLDS NUMBER**
A review and analysis of boundary layer transition data for turbine application
[ASME PAPER 85-GT-83] p 251 A86-22054
Analysis of high Reynolds number transonic flow around an airfoil p 210 N86-17293
The comparison of the transonic airfoil calculation by NSFOIL with the wind tunnel test data at high Reynolds number p 210 N86-17295

**ROBOTS**
Toward automated airframe assembly
p 197 A86-21894
CAD/CAM designer - Jack of all trades
p 251 A86-21895

**ROBUSTNESS (MATHEMATICS)**
Towards robust image matching algorithms
p 230 A86-19620
Robust detection-isolation-accommodation for sensor failures
[NASA-CR-174797] p 255 N86-16486

**ROCKET SOUNDING**
Comparison of calculated and measured height profiles of transverse electric VLF signals across the daytime earth-ionosphere waveguide p 250 A86-21513

**ROLLER BEARINGS**
Lubrication and performance of high-speed rolling-element bearings p 248 A86-19375

**ROLLING MOMENTS**
Estimation of sideforce, yawing moment and rolling moment derivatives due to rate of yaw for complete aircraft at subsonic speeds
[ESDU-84002] p 240 N86-17357

**ROTARY STABILITY**
Reflections regarding recent rotary rig results
[AIAA PAPER 86-0123] p 241 A86-19703

**ROTARY WING AIRCRAFT**
Laboratory and flight testing of ballistic protective headgear for rotary wing aircrew p 261 A86-19344

**ROTARY WINGS**
A three-dimensional viscous flow analysis for the helicopter tip vortex generation process about square and round tipped blades
[AIAA PAPER 86-0560] p 203 A86-19949
The critical role of computational fluid dynamics in rotary-wing aerodynamics
[AIAA PAPER 86-0336] p 204 A86-19971
Scaling of helicopter main rotor noise in hover
[AIAA PAPER 86-0393] p 265 A86-22699
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 1: Background and fatigue evaluation
[RAE-TR-84084] p 226 N86-17336
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 2: Final definition of Helix and Felix
[RAE-TR-84085] p 226 N86-17337
Effect of dynamic stall and elastic parameters on the fundamental mechanisms of helicopter vibrations
[AD-A160022] p 237 N86-17355

**ROTATING BODIES**
Measurements of rotating bubble shapes in low-gravity environment p 251 A66-21996
Flow field survey near the rotational plane of an advanced design propeller on a JetStar airplane
[NASA-TM-86037] p 207 N86-16196

**ROTOR AERODYNAMICS**
Vortex-airfoil interaction tests
[AIAA PAPER 86-0354] p 201 A86-19833
The critical role of computational fluid dynamics in rotary-wing aerodynamics
[AIAA PAPER 86-0336] p 204 A86-19971
Dynamic analysis of complex composite rotor systems with substructure transfer matrix method
[ASME PAPER 85-GT-74] p 235 A86-22049
Validation of viscous and inviscid computational methods for turbomachinery components
[NASA-TM-87193] p 207 N86-16194

**ROTOR BLADES**
The technical development of cooled gas turbine blades
[PNR-90292] p 255 N86-16595

**ROTOR BLADES (TURBOMACHINERY)**
The mechanical design of gas turbine blading in cast superalloys
[PNR-90247] p 237 N86-16223

**ROTOR SYSTEMS RESEARCH AIRCRAFT**
Flight testing the fixed wing configuration of the Rotor Systems Research Aircraft (RSRA) p 223 A86-21064

**ROTORCRAFT AIRCRAFT**
Variable cyclic turboshaft technology for rotorcraft of the '90s p 233 A86-20371

**ROTORS**
Numerical modeling of rotor flows with a conservative form of the full-potential equations
[AIAA PAPER 86-0079] p 198 A86-19676
Stress analysis of 27% scale model of AH-64 main rotor hub
[NASA-TM-87625] p 258 N86-16613
A simulation of rotor-stator interaction using the Euler equations and patched grids
[NASA-TM-86821] p 264 N86-17014

**RUN TIME (COMPUTERS)**
Three-dimensional flight-path reconstruction by means of spline approximation
[NLR-TR-83091-U] p 228 N86-17347

**RUNGE-KUTTA METHOD**
A survey of numerical methods for the calculation of inviscid, possibly rotational Euler flows around aeronautical configurations
[NLR-TR-83130-U] p 258 N86-17699

**RUNWAYS**
Surface properties-vehicle interaction
[PB85-242576] p 255 N86-16428
Estimation of load exceedances of an aircraft under carriage with nonlinear properties excited by random runway unevenness
[NLR-TR-84030-U] p 228 N86-17348

## S

**S CURVES**
Calculation of external and internal transonic flow field of a three-dimensional shielded S-shaped inlet
p 205 A86-22303

**SAILWINGS**
Low speed aerodynamic characteristics of a two-dimensional sail wing with adjustable slack of the sail
[VTH-LR-307] p 211 N86-17314

**SATELLITE NAVIGATION SYSTEMS**
Activities report in aerospace research, with data concerning the scientific committee NLR-NIVR, international cooperation concerning AGARD, DNW, GARTEUR and cooperation with Indonesia
p 257 N86-17588

**SCALE MODELS**
Scaling of helicopter main rotor noise in hover
[AIAA PAPER 86-0393] p 265 A86-22699

**SCENE ANALYSIS**
Automatic exposure control employing scene statistics in reconnaissance cameras p 230 A86-19588

**SEALERS**
Improved temperature resistant sealants for composite & adhesive bonded fuel-tank structures
p 246 A86-21736

**SEARCHING**
Search and Rescue (SAR) System developed as part of the contract signed with the Irish Air Corps for the supply of 365 F Dauphin aircraft
[SNIAS-852-210-105] p 215 N86-17329

**SEAS**
The anatomy of sea SKAD (Survival Kit Air Droppable) - A Canadian Forces/industry development program
p 213 A86-19335

**SEATS**
Development of mechanical components for advanced aircrew seating systems p 217 A86-19307

**SECONDARY FLOW**
3-D design of turbine airfoils
[ASME PAPER 85-GT-188] p 236 A86-22101
Production and development of secondary flows and losses within a three dimensional turbine stator cascade
[ASME PAPER 85-GT-217] p 205 A86-22115
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation
[AD-A159312] p 237 N86-16222

**SEISMOLOGY**
The Shock and Vibration Bulletin 55. Part 2: Dynamic testing, flight vehicle dynamics, seismic loads and fluid-structure interaction
[AD-A160264] p 257 N86-16646

**SELF ADAPTIVE CONTROL SYSTEMS**
'Smart' engine components - A micro in every blade?
p 234 A86-21896

**SENSITIVITY**
Development of a sensitivity analysis technique for multiloop flight control systems
[NASA-CR-166619] p 240 N86-17358

**SEPARATED FLOW**
The computation of steady 3-D separated flows over aerodynamic bodies at incidence and yaw
[AIAA PAPER 86-0109] p 199 A86-19693
Computation of dynamic stall of NACA0012 airfoil by block pentadiagonal matrix scheme
[AIAA PAPER 86-0116] p 199 A86-19697
Aerodynamic measurements of an airfoil with simulated glaze ice
[AIAA PAPER 86-0484] p 202 A86-19897
A solution to the problem of flow past wings with allowance for flow separation on the basis of a system of Euler equations p 205 A86-21345
Numerical simulation of transonic separated flows over low-aspect ratio wings
[AIAA PAPER 86-0508] p 206 A86-22704
Numerical simulation of the leading-edge separation vortex over delta wing p 209 N86-17271

**SEQUENTIAL CONTROL**
A microprocesor sequencer for the advanced Navy ejection seat p 218 A86-19331

**SERVICE LIFE**
The new 'dual stage' test procedure for low cost measurement of parachute performance
p 240 A86-19324
Approach for service life extension of explosive devices for aircraft escape systems p 243 A86-19349
Is there life after 10,000 flight hours?
p 254 A86-22402

**SHADOWS**
Upsilon invariants - A uniform set of moment invariants p 262 A86-19608

**SHALE OIL**
USAF toxicology research on petroleum and shale-derived aviation gas turbine fuels
[ASME PAPER 85-GT-34] p 262 A86-22023

**SHEAR LAYERS**
Influence of excitation on coherent structures in reattaching turbulent shear layers
[AIAA PAPER 86-0112] p 199 A86-19696
Acoustic evaluation of the German-Dutch Wind Tunnel (DNW) shear layer correction using a model jet
[DNW-TR-82-04] p 242 N86-16237

**SHEAR PROPERTIES**
A different approach to designed in passive damping
p 256 N86-16627

**SHIPS**
Helicopter-ship qualification testing
[NLR-MP-84062-U] p 227 N86-17343

**SHOCK WAVE ATTENUATION**
A numerical model of acoustic choking. II - Shocked solutions p 265 A86-20795

**SHOCK WAVES**
Shock modelling in transonic and supersonic flow
p 204 A86-20946
The Shock and Vibration Bulletin 55. Part 2: Dynamic testing, flight vehicle dynamics, seismic loads and fluid-structure interaction
[AD-A160264] p 257 N86-16646

**SHORT HAUL AIRCRAFT**
Design of a twin-engine short-haul commuter aircraft for the 1990s
[AIAA PAPER 86-0077] p 219 A86-19674

**SHORT TAKEOFF AIRCRAFT**
A numerical solution of the downwash associated with a blown-flap system
[AIAA PAPER 86-0473] p 202 A86-19892
Evaluation of an aerodynamic-load prediction method on a STOL fighter configuration
[AIAA PAPER 86-0590] p 203 A86-19966
Blended blown flaps and vectored thrust for low-speed flight
[AIAA PAPER 84-2199] p 221 A86-20157
Velocity and temperature decay characteristics of inverted-profile jets
[AIAA PAPER 86-0312] p 206 A86-22693

**SIGNAL TO NOISE RATIOS**
A new application of adaptive noise cancellation — in acoustic barriers p 262 A86-22626

**SIGNAL TRANSMISSION**
A high bandwidth signal distribution system for aircraft Stores Management Systems (SMS)
p 231 A86-20505

**SILICONE RESINS**
Optically transparent silicone elastomers
p 244 A86-21710

**SIMULATION**
Six degree of freedom simulation of fluid payload projectiles using numerically computed fluid moments
[DE85-017183] p 208 N86-16200
FINDS: A fault inferring nonlinear detection system programmers manual, version 3.0
[NASA-CR-177986] p 231 N86-16212
An investigation of adaptive controllers for helicopter vibration and the development of a new dual controller
[NASA-CR-177377] p 239 N86-16228
Triaxial vibration system p 257 N86-16647

**SINGLE CRYSTALS**
Transition of advanced materials and structures - Single crystal blades p 252 A86-22143

**SKIN FRICTION**
Research on antimisting fuel for suppression of postcrash aircraft fires
[AIAA PAPER 86-0573] p 247 A86-22706

**SLENDER WINGS**
Steady and unsteady full potential calculation for large and small aspect ratio supercritical wings
[AIAA PAPER 86-0122] p 199 A86-19702

**SLIPSTREAMS**
Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187

**SLOTS**
Design of combustor cooling slots for high film effectiveness. I - Film general development
[ASME PAPER 85-GT-35] p 234 A86-22024

**SMOKE**
A smoke generator for the absolute calibration of gas turbine engine smoke sampling and measuring systems
[RAE-TM-P-1044] p 258 N86-17702

**SOFTWARE ENGINEERING**
Development of a generalized escape system simulation computer program p 240 A86-19340

**SORTIE SYSTEMS**
Support effectiveness evaluation model — for military air facilities in sortie generation p 263 A86-22398

**SOUND PROPAGATION**
The effect of acoustic reflections on combustor noise measurements p 265 A86-20364

**SPACE SUITS**
The effect of water ingress on buoyancy and thermal quality of survival suits p 261 A86-19333

**SPACECRAFT CONSTRUCTION MATERIALS**
Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings p 197 A86-22126

**SPACECRAFT STABILITY**
Dynamics R and D in the AFWAL Structures and Dynamics Division p 256 N86-16618

**SPACECRAFT STRUCTURES**
Evolution of Aircraft/Aerospace Structures and Materials Symposium, Dayton, OH, April 24, 25, 1985, Proceedings p 197 A86-22126

**SPANWISE BLOWING**
Lift augmentation via spanwise tip blowing - A numerical study
[AIAA PAPER 86-0474] p 202 A86-19893

**SPARE PARTS**
Using Fleet reported 3-M data in support of Navy emergency escape parachute assemblies
p 212 A86-19326

**SPECIFICATIONS**
The Air Force approach to environmental stress screening p 253 A86-22192
Introduction to deployable recovery systems
[DE86-000048] p 211 N86-17310

**SPECTRORADIOMETERS**
Spectroradiometric calibration of the Thematic Mapper and multispectral scanner system
[E86-10022] p 260 N86-17816

**SPEECH RECOGNITION**
Talking to your aircraft p 239 A86-21900

**SPIN TESTS**
Reflections regarding recent rotary rig results
[AIAA PAPER 86-0123] p 241 A86-19703

**SPLINE FUNCTIONS**
Three-dimensional flight-path reconstruction by means of spline approximation
[NLR-TR-83091-U] p 228 N86-17347

**SPOILERS**
Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187
Application of computational aerodynamics to wing design p 226 N86-17297

**SPRAYED COATINGS**
Strain isolated ceramic coatings for gas turbine engines
[ASME PAPER 85-GT-96] p 247 A86-22062

**STABILITY AUGMENTATION**
Control of a forward-swept-wing configuration dominated by flight dynamic/aeroelastic interactions
p 239 A86-20237

**STANDARDIZATION**
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 1: Background and fatigue evaluation
[RAE-TR-84084] p 226 N86-17336
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 2: Final definition of Helix and Felix
[RAE-TR-84085] p 226 N86-17337

**STANDARDS**
Environment-friendly propeller aircraft with a maximum weight of 5700 kg, and motor gliders: Publication of the noise values p 227 N86-17341

**STATIC TESTS**
An engineering simulation of the Boeing 747 primary flight control systems
[AIAA PAPER 86-0494] p 239 A86-19905
Performance of AV-8B Harrier II structural test program p 241 A86-22189
Lecture notes on fatigue, static tensile strength and stress corrosion of aircraft materials and structures. Part 2: Figures
[VTH-LR-360-PT-2] p 227 N86-17345

**STATISTICAL ANALYSIS**
CERR: An aviation verification program
[PB85-204824] p 260 N86-16854

**STATOR BLADES**
Production and development of secondary flows and losses within a three dimensional turbine stator cascade
[ASME PAPER 85-GT-217] p 205 A86-22115

**STATORS**
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation
[AD-A159312] p 237 N86-16222
A simulation of rotor-stator interaction using the Euler equations and patched grids
[NASA-TM-86821] p 264 N86-17014

**STIFFENING**
Design of hat-stiffened composite panels under uniaxial compression and shear. Minimum mass optimization based on a simplified theory
[VTH-LR-312] p 259 N86-17806

**STOCHASTIC PROCESSES**
Control methodology for stochastic system characteristics modulation
[AIAA PAPER 86-0335] p 262 A86-19621

**STRAIN MEASUREMENT**
Measurement of elastic-plastic strain field at the curve surface crack tip p 249 A86-20175
Fatigue life monitoring of aircraft
[NLR-MP-83069-U] p 226 N86-16211

**STRAIN RATE**
SPF aluminum - A first for the S-76B helicopter — Superplastic Forming p 250 A86-21709

**STRAKES**
Exploratory investigation of deflectable forebody strakes for high angle of attack yaw control
[AIAA PAPER 86-0333] p 238 A86-19819

**STRAPDOWN INERTIAL GUIDANCE**
A redundant strapdown reference for advanced aircraft flight control systems p 239 A86-21840
Construction of a measuring method using fiber optics and an LTN-90 laser gyro strapdown system for BO-105 helicopters
[DFVLR-MITT-85-10] p 216 N86-17333

**STRESS ANALYSIS**
Stress level testing of electronics, avionics communications and C3I equipments
[AD-A159395] p 231 N86-16214
Stress analysis of 27% scale model of AH-64 main rotor hub
[NASA-TM-87625] p 256 N86-16613
The Shock and Vibration Bulletin 55. Part 1: Welcome, keynote address, invited papers, isolation and damping and damping practices
[AD-A160263] p 256 N86-16616
CERT: Where we have been, where we are going
p 256 N86-16620

**STRESS CORROSION**
Lecture notes on fatigue, static tensile strength and stress corrosion of aircraft materials and structures. Part 2: Figures
[VTH-LR-360-PT-2] p 227 N86-17345

**STRUCTURAL ANALYSIS**
Finite element analysis of an ultralight aircraft
p 221 A86-20165
NASA Lewis Research Center/university graduate research program on engine structures
[ASME PAPER 85-GT-159] p 252 A86-22084
Strategies for dynamic modeling of a helicopter structure
[SNIAS-852-210-101] p 228 N86-17350

**STRUCTURAL DESIGN**
Aeroelastic tailoring - Theory, practice, and promise
[AIAA PAPER 84-0982] p 220 A86-20155
Structural demonstration of the AV-8B Harrier II
p 223 A86-21061
Structural and material considerations for advanced fighters p 252 A86-22134
X-20 structures overview p 268 A86-22138
Performance of AV-8B Harrier II structural test program p 241 A86-22189
Dynamics R and D in the AFWAL Structures and Dynamics Division p 256 N86-16618
Optimization in design processes: An informatics point of view
[NLR-MP-84074-U] p 228 N86-17349

**STRUCTURAL DESIGN CRITERIA**
Damage-tolerant aircraft design
[NLR-MP-84005-U] p 227 N86-17342

**STRUCTURAL MEMBERS**
Titanium Near Net Shape components for demanding airframe applications p 245 A86-21726

**STRUCTURAL VIBRATION**
Strategies for dynamic modeling of a helicopter structure
[SNIAS-852-210-101] p 228 N86-17350

**STRUCTURAL WEIGHT**
Aeroelastic tailoring - Theory, practice, and promise
[AIAA PAPER 84-0982] p 220 A86-20155

**SUBSONIC FLOW**
Investigations on efficient numerical method for subsonic lifting surfaces p 209 N86-17285

**SUBSONIC SPEED**
Estimation of sideforce, yawing moment and rolling moment derivatives due to rate of yaw for complete aircraft at subsonic speeds
[ESDU-84002] p 240 N86-17357

**SUBSONIC WIND TUNNELS**
Summary of a high subsonic force/pressure experiment for 58 deg cambered/twisted thick delta wings
[AIAA PAPER 86-0169] p 200 A86-19730
Progress in the Lewis Research Center Altitude Wind Tunnel (AWT) Modeling Program
[NASA-TM-87194] p 242 N86-16233

**SUMS**
Multi-knot Boolean sum interpolating surface interactive design of aircraft configuration p 263 A86-22305

**SUPERCRITICAL AIRFOILS**
Pressure distributions from high Reynolds number tests of a Boeing BAC 1 airfoil in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87600] p 206 N86-16199

**SUPERCRITICAL FLOW**
The comparison of the transonic airfoil calculation by NSFOIL with the wind tunnel test data at high Reynolds number p 210 N86-17295

**SUPERCRITICAL WINGS**
Steady and unsteady full potential calculation for large and small aspect ratio supercritical wings
[AIAA PAPER 86-0122] p 199 A86-19702
Transonic wind tunnel tests of a swept supercritical wing-body model, PT 8
[FFA-TN-1982-24] p 211 N86-17316

**SUPERPLASTICITY**
SPF aluminum - A first for the S-76B helicopter — Superplastic Forming p 250 A86-21709
Superplastically-formed/diffusion-bonded titanium technology transition case study p 252 A86-22142

**SUPERSONIC AIRCRAFT**
A predictive technique for determining store motion after release from a carrier vehicle at supersonic speeds
[AIAA PAPER 86-0586] p 203 A86-19964
Supersonic conventional weapon testing of the F/A-18A Hornet p 222 A86-21052

**SUPERSONIC AIRFOILS**

Supersonic aerodynamic characteristics of some reentry concepts for angles of attack to 90 deg [NASA-TM-87645] p 243 N86-16243

**SUPERSONIC COMBUSTION RAMJET ENGINES**

Evolution and status of CFD techniques for scramjet applications [AIAA PAPER 86-0160] p 248 A86-19970

Liquid fueled supersonic combustion ramjets - A research perspective of the past, present and future [AIAA PAPER 86-0158] p 236 A86-22679

**SUPERSONIC COMPRESSORS**

Mass balancing of hollow fan blades [NASA-TM-87197] p 255 N86-16611

**SUPERSONIC FLOW**

Shock modelling in transonic and supersonic flow p 204 A86-20946

A solution to the problem of flow past wings with allowance for flow separation on the basis of a system of Euler equations p 205 A86-21345

Calculation of supersonic flows around a three-dimensional wing and a waisted body with characteristic method in stream surface coordinates p 206 A86-22319

Numerical issues in computing inviscid supersonic flow over conical delta wings [AIAA PAPER 86-0440] p 206 A86-22701

**SUPERSONIC FLUTTER**

Estimation of divergence and flutter boundaries on supersonic plate wing models from subcritical random responses due to air turbulence [NAL-TR-8[illegible]6] p 211 N86-17308

**SUPERSONIC SPEEDS**

An evaluation of leading-edge flap performance on delta and double-delta wings at supersonic speeds [AIAA PAPER 86-0315] p 201 A86-19806

**SURFACE CRACKS**

Measurement of elastic-plastic strain field at the curve surface crack tip p 249 A86-20175

**SURFACE GEOMETRY**

Interdependence of centrifugal compressor blade geometry and relative flow field [ASME PAPER 85-GT-85] p 251 A86-22056

**SURFACE PROPERTIES**

Surface properties-vehicle interaction [PB85-242576] p 255 N86-16428

**SURFACES**

Investigations on efficient numerical method for subsonic lifting surfaces p 209 N86-17285

**SURVEILLANCE**

United States Coast Guard acquisition of remote sensing capability for ocean surveillance p 231 A86-21234

**SURVIVAL EQUIPMENT**

The effect of water ingress on buoyancy and thermal quality of survival suits p 261 A86-19333

The anatomy of sea SKAD (Survival Kit Air Droppable) - A Canadian Forces/industry development program p 213 A86-19335

**SWEPT FORWARD WINGS**

Divergence study of a high-aspect ratio, forward-swept wing [AIAA PAPER 86-0009] p 219 A86-19632

Dynamics and controls flight testing of the X-29A airplane [AIAA PAPER 86-0167] p 237 A86-19728

Performance of a forward swept wing fighter utilizing thrust vectoring and reversing p 221 A86-20163

Control of a forward-swept-wing configuration dominated by flight dynamic/aeroelastic interactions p 239 A86-20237

**SWEPT WINGS**

Comparison of computations and experimental data for leading edge vortices - Effects of yaw and vortex flaps [AIAA PAPER 86-0439] p 202 A86-19880

The analysis of practical transonic swept wings with and without boundary layer effects p 211 N86-17300

**SWEPTBACK WINGS**

A numerical solution of the transonic integral equation and its application to three-dimensional transonic wing design p 226 N86-17298

Transonic wind tunnel tests of a swept supercritical wing-body model, PT 8 [FFA-TN-1982-24] p 211 N86-17316

**SWIRLING**

An analytical investigation of the effects of swirler design on the performance of annular propulsive nozzles [AIAA PAPER 86-0587] p 233 A86-19965

**SYNCHRONISM**

Synchronizing characteristics of a large variable frequency starting system p 249 A86-20516

Establishment and use of time unification system for civil aviation p 258 N86-17648

**SYNTHETIC APERTURE RADAR**

A Synthetic Aperture Radar (SAR) for commercial applications p 250 A86-21246

**SYSTEM EFFECTIVENESS**

Life cycle cost and availability in military aeronautics p 266 A86-21872

**SYSTEMS ENGINEERING**

Designing an electro-impulse de-icing system [AIAA PAPER 86-0545] p 220 A86-19940

Radars in air traffic control - A status report p 216 A86-21607

Design and evaluation of an instrumentation system for measurements in nonsteady symmetrical flight conditions with the Hawker Hunter MK 7 [VTH-LR-308] p 232 N86-16215

**SYSTEMS SIMULATION**

Development of a generalized escape system simulation computer program p 240 A86-19340

Simulation of a six degrees of freedom flight simulator motion system [UA-00-39] p 241 N86-16230

## T

**TAKEOFF**

Investigation of aircraft departure susceptibility using a total-G simulator [AIAA PAPER 86-0492] p 238 A86-19903

Conventional takeoff and landing (CTOL) airplane ski jump evaluation p 222 A86-21058

Operational application of the STALINS method for measuring take-off and landing trajectories [NLR-TR-83010-U] p 227 N86-17346

**TANKER AIRCRAFT**

Elimination of buffeting on the rear fuselage of the Hercules tanker p 221 A86-20822

Probe and drogue refuelling large receiver aircraft p 223 A86-21062

**TARGET DRONE AIRCRAFT**

Old fighters - New targets p 225 A86-22262

**TARGET RECOGNITION**

Air targeting of the third kind - Airborne vehicles p 230 A86-19617

**TAXIING**

Estimation of load exceedances of an aircraft under carriage with nonlinear properties excited by random runway unevenness [NLR-TR-84030-U] p 228 N86-17348

**TECHNOLOGICAL FORECASTING**

Variable cyclic turboshaft technology for rotorcraft of the '90s p 233 A86-20371

**TECHNOLOGY ASSESSMENT**

Accident investigation as a way of assessing aviation life support system performance p 212 A86-19323

Aircraft design - From the myth of make-do to Mach 3 p 267 A86-22130

The evolution of reciprocating engines at Lycoming p 267 A86-22135

The little turbine business p 236 A86-22200

**TECHNOLOGY UTILIZATION**

A Synthetic Aperture Radar (SAR) for commercial applications p 250 A86-21246

Applications of tubular composite structures p 245 A86-21719

Coupling artificial intelligence and numerical computation for engineering design (invited paper) [AIAA PAPER 86-0242] p 254 A86-22684

The applications of composite materials in the aeronautical domain [SNIAS-852-551-103] p 247 N86-16279

**TEMPERATURE DEPENDENCE**

Laboratory study of the effects of sidewall treatment, source directivity and temperature on the interior noise of a light aircraft fuselage [AIAA PAPER 86-0390] p 219 A86-19851

**TEMPERATURE EFFECTS**

Development of a piezoelectric quartz pressure sensor for avionics with excellent long term stability (with final demonstration of the results on a prototype) [BMFT-FB-W-85-010] p 232 N86-17353

**TENSILE PROPERTIES**

Cast aluminum fatigue property/microstructure relationships p 244 A86-21707

SPF aluminum - A first for the S-76B helicopter --- Superplastic Forming p 250 A86-21709

Evaluation of the Ciba-Geigy R6376 IM6 prepreg --- fiber reinforced plastics [DGT-26.649] p 248 N86-17465

**TENSILE STRENGTH**

Lecture notes on fatigue, static tensile strength and stress corrosion of aircraft materials and structures. Part 2: Figures [VTH-LR-380-PT-2] p 227 N86-17345

**TERMINAL FACILITIES**

Aircraft terminal area guidance based on the discrete tracking problem of optimal control theory p 215 A86-20520

**TERRAIN FOLLOWING AIRCRAFT**

Terrain following avoidance technique of very low altitude penetration p 239 A86-22309

**TEST FACILITIES**

Reflections regarding recent rotary rig results [AIAA PAPER 86-0123] p 241 A86-19703

Facility for closed loop testing of aircraft control systems p 241 A86-22188

Performance of AV-8B Harrier II structural test program p 241 A86-22189

**TEST RANGES**

The role of a real-time flight support facility in flight research programs [AIAA PAPER 86-0166] p 241 A86-19727

**THEMATIC MAPPING**

Spectroradiometric calibration of the Thematic Mapper and multispectral scanner system [E86-10022] p 260 N86-17816

**THERMAL INSULATION**

The effect of water ingress on buoyancy and thermal quality of survival suits p 261 A86-19333

**THERMAL PROTECTION**

The Canadian forces twin Otter aircraft operations in the Arctic - A thermal assessment p 212 A86-19334

Composite fabrics in a thermal protection application p 245 A86-21734

Design of combustor cooling slots for high film effectiveness. I - Film general development [ASME PAPER 85-GT-35] p 234 A86-22024

**THERMAL STABILITY**

The quantification and improvement of the thermal stability of aviation turbine fuel [ASME PAPER 85-GT-33] p 247 A86-22022

Strain isolated ceramic coatings for gas turbine engines [ASME PAPER 85-GT-96] p 247 A86-22062

**THERMOGRAPHY**

Thermographic inspection of carbon epoxy structures p 249 A86-20649

**THICK PLATES**

Summary of a high subsonic force/pressure experiment for 58 deg cambered/twisted thick delta wings [AIAA PAPER 86-0169] p 200 A86-19730

**THREE DIMENSIONAL BODIES**

Conformal mapping as an aid in grid generation for complex three-dimensional configurations [AIAA PAPER 86-0497] p 203 A86-19908

**THREE DIMENSIONAL BOUNDARY LAYER**

Boundary layer calculations on the leeward surface of a slender delta wing at incidence [NLR-TR-84001-U] p 258 N86-17700

**THREE DIMENSIONAL FLOW**

The computation of steady 3-D separated flows over aerodynamic bodies at incidence and yaw [AIAA PAPER 86-0109] p 199 A86-19693

Unsteady three-dimensional simulations of a VTOL upwash fountain [AIAA PAPER 86-0212] p 200 A86-19753

Three-dimensional body-fitting grid system for a complete aircraft [AIAA PAPER 86-0428] p 201 A86-19870

Three-dimensional elliptic grid generation about fighter aircraft for zonal finite-difference computations [AIAA PAPER 86-0429] p 202 A86-19871

A three-dimensional viscous flow analysis for the helicopter tip vortex generation process about square and round tipped blades [AIAA PAPER 86-0560] p 203 A86-19949

Calculation of external and internal transonic flow field of a three-dimensional shielded S-shaped inlet p 205 A86-22303

Simulation of diffuser duct flowfields using a three-dimensional Euler/Navier-Stokes algorithm [AIAA PAPER 86-0310] p 206 A86-22692

Validation of viscous and inviscid computational methods for turbomachinery components [NASA-TM-87193] p 207 N86-16194

Numerical simulation of the leading-edge separation vortex over delta wing p 209 N86-17271

**THREE DIMENSIONAL MOTION**

Three-dimensional flight-path reconstruction by means of spline approximation [NLR-TR-83091-U] p 228 N86-17347

**THRUST AUGMENTATION**

Analysis of interacting dual lifting ejector systems [AIAA PAPER 86-0478] p 233 A86-19895

**THRUST CONTROL**

Development of pneumatic thrust-deflecting powered-lift systems [AIAA PAPER 86-0476] p 219 A86-19894

**THRUST LOADS**

Passive damping, sonic fatigue and the KC-135A p 256 N86-16625

**THRUST REVERSAL**
Numerical solution of 2-D thrust reversing and thrust vectoring nozzle
[AIAA PAPER 86-0203] p 254 A86-22681
**THRUST VECTOR CONTROL**
Vectored thrust digital control of ejection seats
p 218 A86-19318
Blended blown flaps and vectored thrust for low-speed flight
[AIAA PAPER 84-2199] p 221 A86-20157
Performance of a forward swept wing fighter utilizing thrust vectoring and reversing p 221 A86-20163
Numerical solution of 2-D thrust reversing and thrust vectoring nozzle
[AIAA PAPER 86-0203] p 254 A86-22681
**THUNDERSTORMS**
Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes
[AIAA PAPER 86-0021] p 213 A86-19637
**TILT ROTOR AIRCRAFT**
Use of simulation during preliminary design of the V-22 Osprey
[AIAA PAPER 86-0491] p 238 A86-19902
**TIME MEASUREMENT**
Establishment and use of time unification system for civil aviation p 258 N86-17648
**TIMOSHENKO BEAMS**
A new method of analyzing wave propagation in periodic structures - Applications to periodic Timoshenko beams and stiffened plates p 249 A86-20792
**TITANIUM ALLOYS**
Titanium Near Net Shape components for demanding airframe applications p 245 A86-21726
Advances in P/M titanium shape technology using the ceramic mold process p 246 A86-21741
Current and potential usage of titanium castings for airframe applications p 246 A86-21753
PM techniques for making near-net-shape titanium alloy components p 246 A86-21756
Superplastically-formed/diffusion-bonded titanium technology transition case study p 252 A86-22142
**TOLERANCES (MECHANICS)**
The damage tolerance approach in the type approval process p 220 A86-20036
Damage-tolerant aircraft design
[NLR-MP-84005-U] p 227 N86-17342
**TOOLING**
Unique tooling and manufacturing approach for large advanced composite aircraft structure
p 246 A86-21742
**TOXICOLOGY**
USAF toxicology research on petroleum and shale-derived aviation gas turbine fuels
[ASME PAPER 85-GT-34] p 262 A86-22023
**TRACKING FILTERS**
Markov jump-diffussion models and decision-making free filtering — air traffic control
[NLR-MP-83067-U] p 264 N86-17046
A sophisticated tracking algorithm for Air Traffic Control (ATC) surveillance radar data
[NLR-MP-84004-U] p 216 N86-17334
Comparison of a jump-diffusion tracker with a Kalman tracker: An evaluation with emphasis on air traffic control
[NLR-TR-83063-U] p 216 N86-17335
An efficient filter for abruptly changing systems
[NLR-MP-84071-U] p 264 N86-18056
**TRACKING PROBLEM**
Aircraft terminal area guidance based on the discrete tracking problem of optimal control theory
p 215 A86-20520
**TRACTION**
Surface properties-vehicle interaction
[PB85-242576] p 255 N86-16428
**TRAILING EDGES**
Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187
**TRAINING SIMULATORS**
The basics of on-board simulation and embedded training
[AIAA PAPER 86-0493] p 219 A86-19904
An engineering simulation of the Boeing 747 primary flight control systems
[AIAA PAPER 86-0494] p 239 A86-19905
**TRAJECTORY CONTROL**
Flight test maneuver modeling and control
[AIAA PAPER 86-0426] p 219 A86-19868
**TRAJECTORY OPTIMIZATION**
A parallel quasi-linearization algorithm for air vehicle trajectory optimization
[AIAA PAPER 85-0498] p 243 A86-20244
**TRANSATMOSPHERIC VEHICLES**
Supersonic aerodynamic characteristics of some reentry concepts for angles of attack to 90 deg
[NASA-TM-87645] p 243 N86-16243
**TRANSDUCERS**
The application of sensors in light tests
[NLR-MP-84056-U] p 232 N86-17352
**TRANSFER FUNCTIONS**
Helicopter fatigue monitoring using a single channel recorder p 220 A86-20038
**TRANSONIC FLIGHT**
Design of a natural laminar flow wing for a transonic corporate transport
[AIAA PAPER 86-0314] p 200 A86-19807
**TRANSONIC FLOW**
Unsteady transonics of a wing with tip store
[AIAA PAPER 86-0010] p 198 A86-19633
Numerical modeling of rotor flows with a conservative form of the full-potential equations
[AIAA PAPER 86-0079] p 198 A86-19676
Steady and unsteady full potential calculation for large and small aspect ratio supercritical wings
[AIAA PAPER 86-0122] p 199 A86-19702
Evaluation of methods for predicting complex aircraft flowfields
[AIAA PAPER 86-0396] p 201 A86-19855
Practical applications of new LU-ADI scheme for the three-dimensional Navier-Stokes computation of transonic viscous flows
[AIAA PAPER 86-0513] p 203 A86-19922
Numerical simulation of the transonic flowfield for wing/nacelle configurations p 204 A86-20159
Geometry generation for transonic design
p 221 A86-20932
Shock modelling in transonic and supersonic flow
p 204 A86-20946
A transonic rectangular grid embedded panel method
p 204 A86-20953
Transonic blade to blade calculations in an axial, radial or mixed flow cascade equipped with splitter blades
[ASME PAPER 85-GT-86] p 205 A86-22057
Calculation of external and internal transonic flow field of a three-dimensional shielded S-shaped inlet
p 205 A86-22303
Numerical simulation of transonic separated flows over low-aspect ratio wings
[AIAA PAPER 86-0508] p 206 A86-22704
Validation of viscous and inviscid computational methods for turbomachinery components
[NASA-TM-87193] p 207 N86-16194
Implicit finite-difference methods for the calculation of unsteady transonic potential flow around two-dimensional airfoils: A discussion
[NLR-MP-83063-U] p 208 N86-16202
Application of time-linearized methods of oscillating wings in transonic flow and flutter
[NLR-MP-84077-U] p 208 N86-16204
Calculations of transonic flows around single and multielement airfoils on a small computer
[REPT-84-48] p 208 N86-16205
Transonic internal flow about an airfoil oscillating in pitch: Comparisons between computation and experiment
p 209 N86-17278
Numerical analysis for steady transonic flows past an airfoil using AF scheme p 209 N86-17289
Numerical analysis of transonic flow around two-dimensional airfoil by solving Navier-Stokes equations p 210 N86-17292
Analysis of high Reynolds number transonic flow around an airfoil p 210 N86-17293
Validation and comparison with experiment of a high Reynolds number transonic flow airfoil analysis code NSFOIL p 210 N86-17294
The comparison of the transonic airfoil calculation by NSFOIL with the wind tunnel test data at high Reynolds number p 210 N86-17295
A numerical solution of the transonic integral equation and its application to three-dimensional transonic wing design p 226 N86-17298
A wing design based on the three-dimensional transonic inverse method and the comparison with the wind tunnel testing data p 226 N86-17299
The analysis of practical transonic swept wings with and without boundary layer effects p 211 N86-17300
**TRANSONIC FLUTTER**
Transonic internal flow about an airfoil oscillating in pitch: Comparisons between computation and experiment
p 209 N86-17278
**TRANSONIC WIND TUNNELS**
Aircrew escape system models used in wind tunnel tests p 217 A86-19316
Aerodynamic characteristics of a high-wing transport configuration with a over-the-wing nacelle-pylon arrangement
[NASA-TP-2497] p 207 N86-16193
Transonic wind tunnel tests of a swept supercritical wing-body model, PT 8
[FFA-TN-1982-24] p 211 N86-17316
**TRANSPARENCE**
Optically transparent silicone elastomers
p 244 A86-21710
**TRANSPORT AIRCRAFT**
Designing an airlifter - McDonnell Douglas's C-17
p 224 A86-21897
Aerodynamic characteristics of a high-wing transport configuration with a over-the-wing nacelle-pylon arrangement
[NASA-TP-2497] p 207 N86-16193
**TRENDS**
Aircraft noise control: Prospects for the 21st century
[PNR-90272] p 260 N86-16757
**TURBINE BLADES**
Heat transfer measurements with film cooling on a turbine blade profile in cascade
[ASME PAPER 85-GT-117] p 251 A86-22070
Inverse design of coolant flow passage shapes with partially fixed internal geometries
[ASME PAPER 85-GT-118] p 252 A86-22071
Producuon and development of secondary flows and losses within a three dimensional turbine stator cascade
[ASME PAPER 85-GT-217] p 205 A86-22115
An eleven parameter axial turbine airfoil geometry model
[ASME PAPER 85-GT-219] p 205 A86-22117
Transition of advanced materials and structures - Single crystal blades p 252 A86-22143
**TURBINE ENGINES**
Long term deposit formation in aviation turbine fuel at elevated temperature
[AIAA PAPER 86-0525] p 243 A86-19929
3-D design of turbine airfoils
[ASME PAPER 85-GT-188] p 236 A86-22101
**TURBINE WHEELS**
An analysis of rig test disc failures
[PNR-90276] p 237 N86-16224
**TURBOCOMPRESSORS**
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation
[AD-A159312] p 237 N86-16222
**TURBOFAN ENGINES**
Isolated and interacting round parallel heated jets
[AIAA PAPER 86-0281] p 264 A86-19790
Linear-quadratic Gaussian with loop-transfer recovery methodology for the F-100 engine p 233 A86-20233
The KC-135/CFM56 Re-Engine Program
[ASME PAPER 85-GT-211] p 224 A86-22112
Evolution of the turbofan aircraft engine
p 236 A86-22136
Quantitative determination of engine water ingestion
[AIAA PAPER 86-0307] p 254 A86-22690
Estimation of drag due to inoperative turbo-jet and turbo-fan engines using data item nos. 81009 and 84004
[ESDU-84005] p 211 N86-17305
**TURBOJET ENGINE CONTROL**
Linear-quadratic Gaussian with loop-transfer recovery methodology for the F-100 engine p 233 A86-20233
**TURBOJET ENGINES**
Mach number and flow-field calibration at the advanced design propeller location on the JetStar airplane
[NASA-TM-84923] p 207 N86-16197
**TURBOMACHINE BLADES**
Interdependence of centrifugal compressor blade geometry and relative flow field
[ASME PAPER 85-GT-85] p 251 A86-22056
Transonic blade to blade calculations in an axial, radial or mixed flow cascade equipped with splitter blades
[ASME PAPER 85-GT-86] p 205 A86-22057
Axial flow contra-rotating turbines
[ASME PAPER 85-GT-218] p 236 A86-22116
**TURBOPROP ENGINES**
A numerical simulation of the inviscid flow through a counter-rotating propeller
[NASA-TM-87200] p 207 N86-16195
Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance: Preliminary results
[NASA-TM-87637] p 265 N86-17077
**TURBOSHAFTS**
Variable cyclic turboshaft technology for rotorcraft of the '90s p 233 A86-20371
**TURBULENCE EFFECTS**
Acoustic and turbulence influences on stall hysteresis
[AIAA PAPER 86-0170] p 200 A86-19731
Spanwise turbulence effects on aircraft response
[AIAA PAPER 86-0255] p 200 A86-19774
**TURBULENT BOUNDARY LAYER**
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[RAE-TM-AERO-2026] p 211 N86-17307
**TURBULENT FLOW**
Influence of excitation on coherent structures in reattaching turbulent shear layers
[AIAA PAPER 86-0112] p 199 A86-19696

A review and analysis of boundary layer transition data for turbine application
[ASME PAPER 85-GT-83] p 251 A86-22054

**TURBULENT JETS**
Dispersion process of jet engine exhaust plume. II - Buoyant jet p 234 A86-20448

**TWISTED WINGS**
Summary of a high subsonic force/pressure experiment for 58 deg cambered/twisted thick delta wings
[AIAA PAPER 86-0169] p 200 A86-19730
Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187

**TWO DIMENSIONAL BODIES**
Pressure distributions from high Reynolds number tests of a Boeing BAC 1 airfoil in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87600] p 206 N86-16199

**TWO DIMENSIONAL FLOW**
Investigation of chord ratio, stagger, decalage angle, and flap angle for dual wing configurations
[AIAA PAPER 86-0317] p 201 A86-19810
Implicit finite-difference methods for the calculation of unsteady transonic potential flow around two-dimensional airfoils: A discussion
[NLR-MP-83063-U] p 208 N86-16202
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[RAE-TM-AERO-2026] p 211 N86-17307

**TWO FLUID MODELS**
The two-fluid model of turbulent combustion applied to an idealised one-dimensional, unsteady, confined, pre-mixed flame
[PDR/CFDU/IC/21] p 247 N86-16315

## U

**U.S.S.R.**
Some comparisons of US and USSR aircraft design developments
[NASA-TM-87611] p 214 N86-16208

**ULTRALIGHT AIRCRAFT**
Ballistically deployed parachute systems for single and two place aircraft p 212 A86-19319
Finite element analysis of an ultralight aircraft
p 221 A86-20165

**ULTRASONIC WAVE TRANSDUCERS**
Real-time measurement of ice growth during simulated and natural icing conditions using ultrasonic pulse-echo techniques
[AIAA PAPER 86-0410] p 214 A86-19860

**UNDERCARRIAGES**
Estimation of load exceedances of an aircraft under carriage with nonlinear properties excited by random runway unevenness
[NLR-TR-84030-U] p 228 N86-17348

**UNDERWATER BREATHING APPARATUS**
Pilot underwater high pressure emergency breathing system p 261 A86-19343

**UNITED STATES**
Some comparisons of US and USSR aircraft design developments
[NASA-TM-87611] p 214 N86-16208

**UNIVERSITIES**
NASA Lewis Research Center/university graduate research program on engine structures
[ASME PAPER 85-GT-159] p 252 A86-22084

**UNSTEADY FLOW**
Unsteady transonics of a wing with tip store
[AIAA PAPER 86-0010] p 198 A86-19633
Steady and unsteady full potential calculation for large and small aspect ratio supercritical wings
[AIAA PAPER 86-0122] p 199 A86-19702
Unsteady three-dimensional simulations of a VTOL upwash fountain
[AIAA PAPER 86-0212] p 200 A86-19753
Implicit finite-difference methods for the calculation of unsteady transonic potential flow around two-dimensional airfoils: A discussion
[NLR-MP-83063-U] p 208 N86-16202
Numerical simulation of unsteady flow around an airfoil by finite difference solution of Navier-Stokes equations
p 209 N86-17273
Investigations on efficient numerical method for subsonic lifting surfaces p 209 N86-17285

**UPWASH**
Unsteady three-dimensional simulations of a VTOL upwash fountain
[AIAA PAPER 86-0212] p 200 A86-19753

**URETHANES**
Fuel resistant coatings for applications in integral tanks & bladder fuel cells p 246 A86-21737

**USER MANUALS (COMPUTER PROGRAMS)**
Basic aircraft performance --- Book
p 224 A86-21306

## V

**VARIABLE CYCLE ENGINES**
Variable cyclic turboshaft technology for rotorcraft of the '90s p 233 A86-20371

**VARIABLE GEOMETRY STRUCTURES**
Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187

**VELOCITY DISTRIBUTION**
Flow field survey near the rotational plane of an advanced design propeller on a JetStar airplane
[NASA-TM-86037] p 207 N86-16196

**VERTICAL TAKEOFF AIRCRAFT**
Unsteady three-dimensional simulations of a VTOL upwash fountain
[AIAA PAPER 86-0212] p 200 A86-19753
AV-8B design for maintainability p 225 A86-22378
Hot Gas Laboratory twin nozzle calibration
[BAE-ARG-200] p 258 N86-17666

**VERY LOW FREQUENCIES**
Comparison of calculated and measured height profiles of transverse electric VLF signals across the daytime earth-ionosphere waveguide p 250 A86-21513

**VIBRATION**
The Shock and Vibration Bulletin 55. Part 2: Dynamic testing, flight vehicle dynamics, seismic loads and fluid-structure interaction
[AD-A160264] p 257 N86-16646
Triaxial vibration system p 257 N86-16647

**VIBRATION DAMPING**
An investigation of adaptive controllers for helicopter vibration and the development of a new dual controller
[NASA-CR-177377] p 239 N86-16228

**VIBRATION TESTS**
Triaxial vibration system p 257 N86-16647

**VIDEO SIGNALS**
A high bandwidth signal distribution system for aircraft Stores Management Systems (SMS)
p 231 A86-20505

**VISCOELASTIC DAMPING**
Requirements for tailoring of material properties of viscoelastically damped bonded laminates in aircraft structures p 250 A86-21714

**VISCOELASTICITY**
Passive damping, sonic fatigue and the KC-135A
p 256 N86-16625

**VISCOUS DAMPING**
The Shock and Vibration Bulletin 55. Part 1: Welcome, keynote address, invited papers, isolation and damping and damping practices
[AD-A160263] p 256 N86-16616

**VISCOUS DRAG**
Aircraft viscous drag reduction technology
p 204 A86-20124

**VISCOUS FLOW**
Practical applications of new LU-ADI scheme for the three-dimensional Navier-Stokes computation of transonic viscous flows
[AIAA PAPER 86-0513] p 203 A86-19922
A three-dimensional viscous flow analysis for the helicopter tip vortex generation process about square and round tipped blades
[AIAA PAPER 86-0560] p 203 A86-19949
Computational methods in viscous flows
p 250 A86-21026
The numerical solution of the compressible viscous flow field about a complete aircraft in flight
p 205 A86-21033
Validation of viscous and inviscid computational methods for turbomachinery components
[NASA-TM-87193] p 207 N86-16194
Numerical simulation of the leading-edge separation vortex over delta wing p 209 N86-17271
Numerical solution of viscous compressible flows past an airfoil using unconditionally stable explicit method
p 210 N86-17290

**VISIBILITY**
AFOS (Automation of Field Operations and Services) monitory of terminal forecasts
[PB85-236388] p 260 N86-16843

**VOICE CONTROL**
Understanding natural language commands
p 263 A86-20667
Talking to your aircraft p 239 A86-21900

**VORTEX ALLEVIATION**
Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187

**VORTEX FLAPS**
Comparison of computations and experimental data for leading edge vortices - Effects of yaw and vortex flaps
[AIAA PAPER 86-0439] p 202 A86-19880

**VORTEX GENERATORS**
Vortices produced by air pulse injection from the surface of an oscillating airfoil
[AIAA PAPER 86-0118] p 199 A86-19699

**VORTEX SHEDDING**
Fluid dynamics of cylinder response to Karman vortex shedding
[AIAA PAPER 86-0119] p 199 A86-19700
Reflections regarding recent rotary rig results
[AIAA PAPER 86-0123] p 241 A86-19703

**VORTEX SHEETS**
A survey of numerical methods for the calculation of inviscid, possibly rotational Euler flows around aeronautical configurations
[NLR-TR-83130-U] p 258 N86-17699

**VORTICES**
Visualization and flow surveys of the leading edge vortex structure on delta wing planforms
[AIAA PAPER 86-0330] p 201 A86-19817
Vortex-airfoil interaction tests
[AIAA PAPER 86-0354] p 201 A86-19833
Comparison of computations and experimental data for leading edge vortices - Effects of yaw and vortex flaps
[AIAA PAPER 86-0439] p 202 A86-19880
A three-dimensional viscous flow analysis for the helicopter tip vortex generation process about square and round tipped blades
[AIAA PAPER 86-0560] p 203 A86-19949
Vortex roll-up for an elliptically-loaded wing at moderately low Reynolds numbers
[AIAA PAPER 86-0562] p 203 A86-19951
Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187
An experimental investigation of the entrainment into a leading-edge vortex
[VTH-LR-332] p 208 N86-16203

## W

**WAKES**
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation
[AD-A159312] p 237 N86-16222
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[RAE-TM-AERO-2026] p 211 N86-17307

**WATER**
Quantitative determination of engine water ingestion
[AIAA PAPER 86-0307] p 254 A86-22690

**WATER IMMERSION**
How much inherent buoyancy is acceptable in a helicopter passenger immersion suit
p 261 A86-19310
The effect of water ingress on buoyancy and thermal quality of survival suits p 261 A86-19333

**WAVE PROPAGATION**
A new method of analyzing wave propagation in periodic structures - Applications to periodic Timoshenko beams and stiffened plates p 249 A86-20792

**WAVEGUIDE ANTENNAS**
Comparison of calculated and measured height profiles of transverse electric VLF signals across the daytime earth-ionosphere waveguide p 250 A86-21513

**WEAPON SYSTEM MANAGEMENT**
Life cycle cost and availability in military aeronautics
p 266 A86-21872

**WEAPON SYSTEMS**
A predictive technique for determining store motion after release from a carrier vehicle at supersonic speeds
[AIAA PAPER 86-0586] p 203 A86-19964
Supersonic conventional weapon testing of the F/A-18A Hornet p 222 A86-21052
Testing Canadian unique features of the CF-18 - The first year p 223 A86-21060
The Air Force approach to environmental stress screening p 253 A86-22182

**WEATHER**
Determining the effects of weather in aircraft accident investigations
[AIAA PAPER 86-0323] p 213 A86-19813
Weather-involved U.S. air carrier accidents 1962-1984 - A compendium and brief summary
[AIAA PAPER 86-0327] p 214 A86-19815
CERR: An aviation verification program
[PB85-204824] p 260 N86-16854

**WEATHER FORECASTING**
AFOS (Automation of Field Operations and Services) monitory of terminal forecasts
[PB85-236388] p 260 N86-16843
CERR: An aviation verification program
[PB85-204824] p 260 N86-16854

**WEIGHT REDUCTION**
Ballistically deployed parachute systems for single and two place aircraft p 212 A86-19319

Assessing cost-effective weight saving in aircraft operations p 220 A86-20039

The material development, component manufacture, and post-service evaluation of RB211-524 cowl doors utilizing carbon fibre composite materials
[PNR-90275] p 247 N86-16273

The applications of composite materials in the aeronautical domain
[SNIAS-852-551-103] p 247 N86-16279

Design of hat-stiffened composite panels under uniaxial compression and shear. Minimum mass optimization based on a simplified theory
[VTH-LR-312] p 259 N86-17806

**WELDED JOINTS**

Fatigue testing of tube to node butt welds envisaged for RAE Bedford flight simulator
[REPT-23460/2/85] p 257 N86-16674

**WEST GERMANY**

Activities in air traffic control p 216 N86-17331

**WIND (METEOROLOGY)**

An extreme clear air turbulence incidence associated with a strong downslope windstorm
[AIAA PAPER 86-0329] p 259 A86-19816

AFOS (Automation of Field Operations and Services) monitory of terminal forecasts
[PB85-236388] p 260 N86-16843

**WIND SHEAR**

Wind shear characterization
[AIAA PAPER 86-0180] p 213 A86-19737

**WIND TUNNEL APPARATUS**

Study of ice accretion on icing wind tunnel components
[NASA-TM-87095] p 242 N86-16232

**WIND TUNNEL CALIBRATION**

Aeroacoustic calibration of the German-Dutch Wind Tunnel (DNW) open jet
[DNW-TR-82-03] p 242 N86-16236

Acoustic evaluation of the German-Dutch Wind Tunnel (DNW) shear layer correction using a model jet
[DNW-TR-82-04] p 242 N86-16237

Aerodynamical calibration of the German-Dutch Wind Tunnel (DNW): A review of testing techniques and results
[DNW-PA-82062] p 242 N86-16238

**WIND TUNNEL DRIVES**

Study of ice accretion on icing wind tunnel components
[NASA-TM-87095] p 242 N86-16232

**WIND TUNNEL MODELS**

Simulation and analysis of natural rain in a wind tunnel via digital image processing techniques
[AIAA PAPER 86-0291] p 241 A86-22687

Pressure distributions from high Reynolds number tests of a Boeing BAC 1 airfoil in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87600] p 208 N86-16199

**WIND TUNNEL NOZZLES**

Study of ice accretion on icing wind tunnel components
[NASA-TM-87095] p 242 N86-16232

**WIND TUNNEL STABILITY TESTS**

Acoustic and turbulence influences on stall hysteresis
[AIAA PAPER 86-0170] p 200 A86-19731

**WIND TUNNEL TESTS**

Aircrew escape system models used in wind tunnel tests p 217 A86-19316

Divergence study of a high-aspect ratio, forward-swept wing
[AIAA PAPER 86-0009] p 219 A86-19632

Oscillating hot-wire measurements above an FX63-137 airfoil
[AIAA PAPER 86-0012] p 198 A86-19635

Lift-curve characteristics for an airfoil pitching at constant rate
[AIAA PAPER 86-0117] p 199 A86-19698

Experimental study of effects of forebody geometry on high angle of attack static and dynamic stability
[AIAA PAPER 86-0331] p 238 A86-19818

Vortex-airfoil interaction tests
[AIAA PAPER 86-0354] p 201 A86-19833

Small scale wind tunnel testing of model propellers
[AIAA PAPER 86-0392] p 233 A86-19853

Aerodynamic measurements of an airfoil with simulated glaze ice
[AIAA PAPER 86-0484] p 202 A86-19897

Evaluation of an aerodynamic-load prediction method on a STOL fighter configuration
[AIAA PAPER 86-0590] p 203 A86-19966

Scaling of helicopter main rotor noise in hover
[AIAA PAPER 86-0393] p 265 A86-22699

Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187

Aerodynamic characteristics of a high-wing transport configuration with a over-the-wing nacelle-pylon arrangement
[NASA-TP-2497] p 207 N86-16193

Mach number and flow-field calibration at the advanced design propeller location on the JetStar airplane
[NASA-TM-84923] p 207 N86-16197

Pressure distributions from high Reynolds number tests of a Boeing BAC 1 airfoil in the Langley 0.3-meter transonic cryogenic tunnel
[NASA-TM-87600] p 208 N86-16199

Investigation of the aerodynamic forces on bluff bodies at high Reynolds numbers
[ESA-TT-914] p 209 N86-16206

Study of ice accretion on icing wind tunnel components
[NASA-TM-87095] p 242 N86-16232

Progress in the Lewis Research Center Altitude Wind Tunnel (AWT) Modeling Program
[NASA-TM-87194] p 242 N86-16233

German-Dutch wind tunnel (DNW). Present and future applications for industrial developments
p 242 N86-16235

Aerodynamical calibration of the German-Dutch Wind Tunnel (DNW): A review of testing techniques and results
[DNW-PA-82062] p 242 N86-16238

Image processing of aerodynamic data
[NASA-TM-87629] p 255 N86-16553

A wing design based on the three-dimensional transonic inverse method and the comparison with the wind tunnel testing data p 226 N86-17299

Estimation of divergence and flutter boundaries on supersonic plate wing models from subcritical random responses due to air turbulence
[NAL-TR-856] p 211 N86-17308

Low speed aerodynamic characteristics of a two-dimensional sail wing with adjustable slack of the sail
[VTH-LR-307] p 211 N86-17314

Transonic wind tunnel tests of a swept supercritical wing-body model, PT 8
[FFA-TN-1982-24] p 211 N86-17316

Hot Gas Laboratory twin nozzle calibration
[BAE-ARG-200] p 256 N86-17666

Sound excitation during vortex-airfoil interaction
[MPIS-MITT-80] p 266 N86-18130

Engineering Data Interactive Presentation and Analysis System (EDIPAS): A general approach to engineering data management and analysis applied to wind tunnel testing
[NLR-MP-83057-U] p 267 N86-18252

**WIND TUNNELS**

German-Dutch wind tunnel (DNW). Present and future applications for industrial developments
p 242 N86-16235

**WIND VANES**

Study of ice accretion on icing wind tunnel components
[NASA-TM-87095] p 242 N86-16232

**WING FLAPS**

Velocity and temperature decay characteristics of inverted-profile jets
[AIAA PAPER 86-0312] p 208 A86-22693

Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187

**WING FLOW METHOD TESTS**

Divergence study of a high-aspect ratio, forward-swept wing
[AIAA PAPER 86-0009] p 219 A86-19632

**WING NACELLE CONFIGURATIONS**

Numerical simulation of the transonic flowfield for wing/nacelle configurations p 204 A86-20159

**WING OSCILLATIONS**

Computation of dynamic stall of NACA0012 airfoil by block pentadiagonal matrix scheme
[AIAA PAPER 86-0116] p 199 A86-19697

Vortices produced by air pulse injection from the surface of an oscillating airfoil
[AIAA PAPER 86-0118] p 199 A86-19699

Design of an active flutter suppression system
p 239 A86-20236

Application of time-linearized methods of oscillating wings in transonic flow and flutter
[NLR-MP-84077-U] p 208 N86-16204

**WING PLANFORMS**

Vortex roll-up for an elliptically-loaded wing at moderately low Reynolds numbers
[AIAA PAPER 86-0562] p 203 A86-19951

**WING PROFILES**

Design of a natural laminar flow wing for a transonic corporate transport
[AIAA PAPER 86-0314] p 200 A86-19807

Investigation of chord ratio, stagger, decalage angle, and flap angle for dual wing configurations
[AIAA PAPER 86-0317] p 201 A86-19810

Image processing of aerodynamic data
[NASA-TM-87629] p 255 N86-16553

A wing design based on the three-dimensional transonic inverse method and the comparison with the wind tunnel testing data p 226 N86-17299

**WING SLOTS**

Influence of wing tip configuration on lateral blowing efficiency
[AIAA PAPER 86-0475] p 206 A86-22702

**WING SPAN**

Vortex wake alleviation studies with a variable twist wing
[NASA-TP-2442] p 197 N86-16187

**WING TIP VORTICES**

Lift augmentation via spanwise tip blowing - A numerical study
[AIAA PAPER 86-0474] p 202 A86-19893

A vortex lattice method for jet wing performance with nonlinear wake and tip flow p 205 A86-22311

Sound excitation during vortex-airfoil interaction
[MPIS-MITT-80] p 266 N86-18130

**WING TIPS**

Unsteady transonics of a wing with tip store
[AIAA PAPER 86-0010] p 198 A86-19633

Influence of wing tip configuration on lateral blowing efficiency
[AIAA PAPER 86-0475] p 206 A86-22702

**WING-FUSELAGE STORES**

Control of a forward-swept-wing configuration dominated by flight dynamic/aeroelastic interactions
p 239 A86-20237

**WINGS**

A case study in fatigue life extension - The main spar of RAAF Mirage IIIO wings p 225 A86-22165

A vortex lattice method for jet wing performance with nonlinear wake and tip flow p 205 A86-22311

Calculation of misalignment error of multi-joint holes of wing to fuselage p 253 A86-22318

Design and fabrication of an advanced composite cellular wing box
[VTH-LR-315] p 227 N86-17344

## X

**X-15 AIRCRAFT**

X-15 high temperature advanced structure
p 268 A86-22137

**X-20 AIRCRAFT**

X-20 structures overview p 268 A86-22138

**X-29 AIRCRAFT**

Dynamics and controls flight testing of the X-29A airplane
[AIAA PAPER 86-0167] p 237 A86-19728

Performance of a forward swept wing fighter utilizing thrust vectoring and reversing p 221 A86-20163

## Y

**YAW**

Yaw stabilization of an open ejection seat, fact or fantasy? p 217 A86-19305

The computation of steady 3-D separated flows over aerodynamic bodies at incidence and yaw
[AIAA PAPER 86-0109] p 199 A86-19693

Exploratory investigation of deflectable forebody strakes for high angle of attack yaw control
[AIAA PAPER 86-0333] p 238 A86-19819

Comparison of computations and experimental data for leading edge vortices - Effects of yaw and vortex flaps
[AIAA PAPER 86-0439] p 202 A86-19880

Estimation of sideforce, yawing moment and rolling moment derivatives due to rate of yaw for complete aircraft at subsonic speeds
[ESDU-84002] p 240 N86-17357

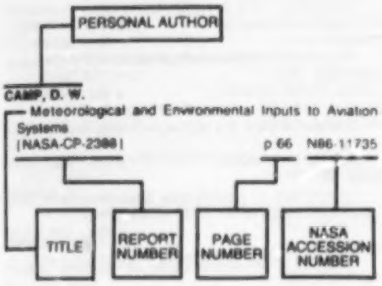
**YAWING MOMENTS**

Estimation of sideforce, yawing moment and rolling moment derivatives due to rate of yaw for complete aircraft at subsonic speeds
[ESDU-84002] p 240 N86-17357

# PERSONAL AUTHOR INDEX

**AERONAUTICAL ENGINEERING** / *A Continuing Bibliography (Supplement 200)* MAY 1986

### Typical Personal Author Index Listing



Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

## A

**AARON, K. M.**
Simulation and analysis of natural rain in a wind tunnel via digital image processing techniques
[AIAA PAPER 86-0291] p 241 A86-22687

**AARTMAN, L.**
Development of an airborne CCD scanner for land and sea applications p 231 A86-21163

**ABDEL KADER, A. A.**
Control methodology for stochastic system characteristics modulation
[AIAA PAPER 86-0335] p 262 A86-19821

**ABEYOUNIS, W. K.**
Aerodynamic characteristics of a high-wing transport configuration with a over-the-wing nacelle-pylon arrangement
[NASA-TP-2497] p 207 N86-16193

**ADAMCZYK, J. H.**
A numerical simulation of the inviscid flow through a counter-rotating propeller
[NASA-TM-87200] p 207 N86-16195

**ADAMS, P. V.**
A new generation advanced I.R. Linescan Sensor system p 229 A86-19585

**ADAMS, W. M.**
Design of an active flutter suppression system
p 239 A86-20236

**AGRAWAL, S. K.**
Surface properties-vehicle interaction
[PB85-242576] p 255 N86-16428

**ALBERY, W.**
Development of an electro-pneumatic anti-G valve for high performance fighter aircraft p 218 A86-19317

**ALBUGUES, F.**
Nondestructive inspection: An efficient investment
[SNIAS-852-430-110] p 247 N86-16276

**ALLEN, M. M.**
Transition of advanced materials and structures - Single crystal blades p 252 A86-22143

**ALLEN, R. M.**
Aeroacoustic calibration of the German-Dutch Wind Tunnel (DNW) open jet
[DNW-TR-82-03] p 242 N86-16236

**ANDERSON, R. E.**
A shared satellite system would satisfy many future aviation needs p 249 A86-20921

**ANDERSON, R. J.**
AV-8B design for maintainability p 225 A85-22378

**ANDO, S.**
Investigations on efficient numerical method for subsonic lifting surfaces p 209 N86-17285

**ANDO, Y.**
Estimation of divergence and flutter boundaries on supersonic plate wing models from subcritical random responses due to air turbulence
[NAL-TR-856] p 211 N86-17308

**ANDREWS, G. E.**
Full coverage discrete hole film cooling - The influence of hole size
[ASME PAPER 85-GT-47] p 251 A86-22035

**ASERE, A. A.**
Full coverage discrete hole film cooling - The influence of hole size
[ASME PAPER 85-GT-47] p 251 A86-22035

**ASQUITH, G.**
An analysis of rig test disc failures
[PNR-90276] p 237 N86-16224

**ATHANS, M.**
Linear-quadratic Gaussian with loop-transfer recovery methodology for the F-100 engine p 233 A86-20233

**ATTA, E. H.**
Numerical simulation of the transonic flowfield for wing/nacelle configurations p 204 A86-20150

**AUGUSTYN, T.**
KS-146A camera development and flight test results
p 229 A86-19583

**AYOUB, P.**
A microprocessor sequencer for the advanced Navy ejection seat p 218 A86-19331

## B

**BAARSLAG, J. F. W.**
Noise assessment around Schiphol airport (the Netherlands) in 1981
[NLR-TR-82034-U] p 260 N86-17915

**BACH, R. E., JR.**
An extreme clear air turbulence incidence associated with a strong downslope windstorm
[AIAA PAPER 86-0329] p 256 A86-19816

**BAILE, M. D.**
Optically transparent silicone elastomers
p 244 A86-21710

**BAR-SHALOM, Y.**
An investigation of adaptive controllers for helicopter vibration and the development of a new dual controller
[NASA-CR-177377] p 239 N86-16228

**BARBASH, G. I.**
Airport preparedness for mass disaster - A proposed schematic plan p 214 A86-20411

**BARBIER, P.**
Description of a nondestructive facility using holographic interferometry
[SNIAS-852-430-105] p 258 N86-17726

**BARCHE, J.**
German-Dutch wind tunnel (DNW). Present and future applications for industrial developments
p 242 N86-16235

**BARNES, D.**
F-20A Tigershark progress report p 222 A86-21057

**BASS, R. M.**
Small scale wind tunnel testing of model propellers
[AIAA PAPER 86-0392] p 233 A86-19853

**BATHIAS, C.**
Delamination threshold and loading effect in fiber glass epoxy composite p 244 A86-20636

**BATRA, N. N.**
Use of simulation during preliminary design of the V-22 Osprey
[AIAA PAPER 86-0491] p 238 A86-19902

**BAUCOM, C. M.**
F-14A low altitude, low airspeed, high angle of attack asymmetric thrust flight test program
p 222 A86-21053

**BAUGHN, T. V.**
Finite element analysis of an ultralight aircraft
p 221 A86-20165

**BAUMGARTNER, S. J.**
Controllable ejection seat catapult program
p 218 A86-19339

**BEARD, K. W.**
Maintenance strategies for aero engines
p 253 A86-22384

**BECKER, P.**
Analysis of the noise emitted by a tail rotor
p 266 N86-18129

**BECKWITH, G. T.**
Electrodeposited primer scale-up and qualification
p 245 A86-21735

**BEEKS, K**
Non-rigid airship testing p 223 A86-21059

**BELLAMY, R. A.**
Developing concepts in the rotordynamic analysis of aero gas turbines
[ASME PAPER 85-GT-230] p 236 A86-22126

**BEMENT, L. J.**
Approach for service life extension of explosive devices for aircraft escape systems p 243 A86-19349

**BENNETT, J. E.**
Aircraft terminal area guidance based on the discrete tracking problem of optimal control theory
p 215 A86-20520

**BENSTEIN, E. H.**
Variable cyclic turboshaft technology for rotorcraft of the '90s p 233 A86-20371

**BERRY, D. T.**
A flightpath overshoot flying qualities metric for the landinig task
[AIAA PAPER 86-0334] p 236 A86-19820

**BERTHEAU, F.**
Transonic blade to blade calculations in an axial, radial or mixed flow cascade equipped with splitter blades
[ASME PAPER 85-GT-86] p 205 A86-22057

**BEST, M. R.**
Three-dimensional flight-path reconstruction by means of spline approximation
[NLR-TR-83091-U] p 228 N86-17347

**BESTER, C. J.**
Surface properties-vehicle interaction
[PB85-242576] p 256 N86-16428

**BIENER, A.**
Computer controlled operation of reconnaissance cameras p 220 A86-19587

**BINNENKADE, P.**
Development of an airborne CCD scanner for land and sea applications p 231 A86-21163

**BLAETZ, J.**
Facility for closed loop testing of aircraft control systems p 241 A86-22188

**BLOM, H. A. P.**
Markov jump-diffusion models and decision-making free filtering
[NLR-MP-83067-U] p 264 N86-17046
A sophisticated tracking algorithm for Air Traffic Control (ATC) surveillance radar data
[NLR-MP-840[illegible]1-U] p 216 N86-17334
Comparison of a jump-diffusion tracker with a Kalman tracker: An evaluation with emphasis on air traffic control
[NLR-TR-83063-U] p 216 N86-17335
An efficient filter for abruptly changing systems
[NLR-MP-84071-U] p 264 N86-18056

**BLUNDELL, J. K.**
Maintenance strategies for aero engines
p 253 A86-22384

**BOELKOW, L.**
Air and space flight. Dream and facts
[MBB-FILM-382] p 198 N86-16188

**BOERSTOEL, J. W.**
Optimization in design processes: An informatics point of view
[NLR-MP-84074-U] p 228 N86-17349
A survey of numerical methods for the calculation of inviscid, possibly rotational Euler flows around aeronautical configurations
[NLR-TR-83130-U] p 258 N86-17699

**BOSE, D.**
High strength nickel-palladium-chromium brazing alloys p 244 A86-20579

**BOUCHARD, E. D.**
Superplastically-formed/diffusion-bonded titanium technology transition case study p 252 A86-22142

**BOUCHARD, M. P.**
Passive damping, sonic fatigue and the KC-135A p 256 N86-16625

**BOULAY, J. L.**
Feasibility study of a device to control aircraft electromagnetic protection
[ONERA-RS-10/3466-PY] p 257 N86-17637

**BOWDEN, T. T.**
The effect of fuel composition upon combustion performance in a Rolls Royce Tyne combustor
[ASME PAPER 85-GT-39] p 234 A86-22028

**BOYER, R. R.**
Current and potential usage of titanium castings for airframe applications p 246 A86-21753

**BRADY, B. J.**
The basics of on-board simulation and embedded training
[AIAA PAPER 86-0493] p 219 A86-19904

**BRADY, J. B.**
Strain isolated ceramic coatings for gas turbine engines
[ASME PAPER 85-GT-96] p 247 A86-22062

**BRAGG, M. B.**
Aerodynamic measurements of an airfoil with simulated glaze ice
[AIAA PAPER 86-0484] p 202 A86-19897
Airfoil aerodynamics in icing conditions p 204 A86-20164

**BRAHNEY, J. H.**
Old fighters - New targets p 225 A86-22262
Exploring the unknown with unmanned aircraft p 225 A86-22263

**BRANDON, J. K.**
Synchronizing characteristics of a large variable frequency starting system p 249 A86-20516

**BRANDON, J. M.**
Experimental study of effects of forebody geometry on high angle of attack static and dynamic stability
[AIAA PAPER 86-0331] p 238 A86-19818

**BROOKS, C. J.**
How much inherent buoyancy is acceptable in a helicopter passenger immersion suit p 261 A86-19310

**BROWN, E. M.**
Improved temperature resistant sealants for composite & adhesive bonded fuel-tank structures p 246 A86-21736
Fuel resistant coatings for applications in integral tanks & bladder fuel cells p 246 A86-21737

**BROWN, J. A.**
Probe and drogue refuelling large receiver aircraft p 223 A86-21062

**BROWN, P. W.**
Description of and results from camera systems for recording daytime lightning strikes to an airplane in flight
[AIAA PAPER 84-0020] p 230 A86-19636

**BULLOCK, B. L.**
A Synthetic Aperture Radar (SAR) for commercial applications p 250 A86-21246

**BUNNIK, N. J. J.**
Development of an airborne CCD scanner for land and sea applications p 231 A86-21163

**BURGIN, G. H.**
The Adaptive Maneuvering Logic program in support of the pilot's associate program - A heuristic approach to missile evasion
[AIAA PAPER 86-0423] p 263 A86-19865

**BURKHARD, A.**
CERT: Where we have been, where we are going p 256 N86-16620

**BURLEY, R. R.**
Progress in the Lewis Research Center Altitude Wind Tunnel (AWT) Modeling Program
[NASA-TM-87194] p 242 N86-16233

**BUSSOLETTI, J. E.**
A transonic rectangular grid embedded panel method p 204 A86-20953

**BUTLER, M. C., JR.**
A philosophical basis for the use of high-performance, gliding parachutes in ejection seat aircraft p 213 A86-19352

## C

**CAI, R.**
An improved simple method for designing optimum annular diffusers
[ASME PAPER 85-GT-126] p 235 A86-22075

**CALE, R. E.**
Meteorological factors in selected aircraft accident investigations
[AIAA PAPER 86-0324] p 213 A86-19814

**CAMBERLEIN, L.**
A redundant strapdown reference for advanced aircraft flight control systems p 239 A86-21840

**CAMP, D. W.**
Wind shear characterization
[AIAA PAPER 86-0180] p 213 A86-19737
Spanwise turbulence effects on aircraft response
[AIAA PAPER 86-0255] p 200 A86-19774

**CAMPBELL, R. L.**
Design of a natural laminar flow wing for a transonic corporate transport
[AIAA PAPER 86-0314] p 200 A86-19807

**CANTWELL, B. J.**
Numerical simulation of transonic separated flows over low-aspect ratio wings
[AIAA PAPER 86-0506] p 206 A86-22704

**CARADONNA, F. X.**
Numerical modeling of rotor flows with a conservative form of the full-potential equations
[AIAA PAPER 86-0079] p 198 A86-19676

**CAREW-JONES, R.**
Evolution of real time airborne reconnaissance p 229 A86-19566

**CARR, J. E.**
Blended blown flaps and vectored thrust for low-speed flight
[AIAA PAPER 84-2199] p 221 A86-20157

**CARROLL, J. V.**
Vectored thrust digital control of ejection seats p 218 A86-19318

**CASTELLS, O. T.**
F-14 re-engining with the F110 engine
[ASME PAPER 85-GT-184] p 224 A86-22098

**CELESTINA, M. L.**
A numerical simulation of the inviscid flow through a counter-rotating propeller
[NASA-TM-87200] p 207 N86-16195

**CENKO, A.**
Evaluation of methods for predicting complex aircraft flowfields
[AIAA PAPER 86-0396] p 201 A86-19855

**CHAKRAVARTHY, S. R.**
Numerical issues in computing inviscid supersonic flow over conical delta wings
[AIAA PAPER 86-0440] p 206 A86-22701

**CHAMIS, C. C.**
NASA Lewis Research Center/university graduate research program on engine structures
[ASME PAPER 85-GT-159] p 252 A86-22084

**CHANDHOK, V. K.**
Advances in P/M titanium shape technology using the ceramic mold process p 246 A86-21741

**CHANG, H.-P.**
Wind shear characterization
[AIAA PAPER 86-0180] p 213 A86-19737

**CHANG, I.-C.**

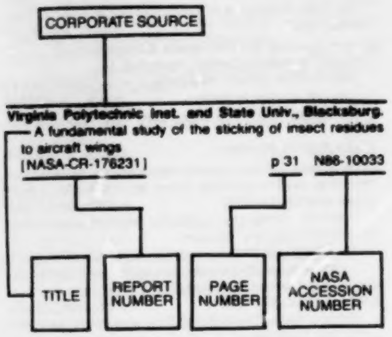
# CORPORATE SOURCE INDEX

### Typical Corporate Source Index Listing



CORPORATE SOURCE
Virginia Polytechnic Inst. and State Univ., Blacksburg.
A fundamental study of the sticking of insect residues to aircraft wings
[NASA-CR-176231]
p 31
N86-10033
TITLE
REPORT NUMBER
PAGE NUMBER
NASA ACCESSION NUMBER

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

## A

**Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).**
AGARD Corrosion Handbook. Volume 1: Corrosion, causes and case histories
[AGARD-AG-278-VOL-1] p 248 N86-16374

**Aeronautical Research Inst. of Sweden, Stockholm.**
Transonic wind tunnel tests of a swept supercritical wing-body model, PT 8
[FFA-TN-1982-24] p 211 N86-17316

**Aeronautical Research Labs., Melbourne (Australia).**
A FORTRAN program for the determination of unsteady airforces on general combinations of interfering lifting surfaces oscillating in subsonic flow
[ARL-STRUCT-R-412] p 206 N86-16191

**Aeronautical Systems Div., Wright-Patterson AFB, Ohio.**
AVIP Air Force thrust for reliability
p 256 N86-16617

**Air Force Flight Dynamics Lab., Wright-Patterson AFB, Ohio.**
Airworthiness flight test program of an aircraft equipment fairing p 226 N86-16653

**Air Force Wright Aeronautical Labs., Wright-Patterson AFB, Ohio.**
Aeroelastic tailoring - Theory, practice, and promise
[AIAA PAPER 84-0982] p 220 A86-20155
Dynamics R and D in the AFWAL Structures and Dynamics Division p 256 N86-16618
CERT: Where we have been, where we are going
p 256 N86-16620

**ALPHATECH, Inc., Burlington, Mass.**
Robust detection-isolation-accommodation for sensor failures
[NASA-CR-174797] p 255 N86-16486

**Amtec Engineering, Inc., Bellevue, Wash.**
Numerical solution of 2-D thrust reversing and thrust vectoring nozzle
[AIAA PAPER 86-0203] p 254 A86-22681

**Arizona Univ., Tucson.**
Spectroradiometric calibration of the Thematic Mapper and multispectral scanner system
[E86-10022] p 260 N86-17816

**Army Aeronautical Research Lab., Moffett Field, Calif.**
Flight testing the fixed wing configuration of the Rotor Systems Research Aircraft (RSRA) p 223 A86-21064

**Army Aviation Systems Command, Moffett Field, Calif.**
Numerical modeling of rotor flows with a conservative form of the full-potential equations
[AIAA PAPER 86-0079] p 198 A86-19676

**Army Structures Lab., Hampton, Va.**
Repeatability of mixed-mode adhesive debonding
p 249 A86-20638

**Army Test and Evaluation Command, Aberdeen Proving Ground, Md.**
Stress level testing of electronics, avionics communications and C3I equipments
[AD-A159395] p 231 N86-16214

**Avions Marcel Dassault-Breguet Aviation, Saint-Cloud (France).**
Evaluation of the Ciba-Geigy R6376 IM6 prepreg
[DGT-26.649] p 248 N86-17485
Study of composite material curing molds
[DGT-26.817] p 248 N86-17486

## B

**Boeing Computer Services Co., Tukwila, Wash.**
A transonic rectangular grid embedded panel method
p 204 A86-20953

**Boeing Military Airplane Development, Seattle, Wash.**
A transonic rectangular grid embedded panel method
p 204 A86-20953

**Bolt, Beranek, and Newman, Inc., Cambridge, Mass.**
FINDS: A fault inferring nonlinear detection system programmers manual, version 3.0
[NASA-CR-177986] p 231 N86-16212

**British Aerospace Aircraft Group, Preston (England).**
Hot Gas Laboratory twin nozzle calibration
[BAE-ARG-200] p 258 N86-17666

**Bundesanstalt fuer Flugsicherung, Frankfurt am Main (West Germany).**
Activities in air traffic control p 216 N86-17331
Environment-friendly propeller aircraft with a maximum weight of 5700 kg, and motor gliders: Publication of the noise values p 227 N86-17341

## C

**California Univ., La Jolla.**
Simulation and analysis of natural rain in a wind tunnel via digital image processing techniques
[AIAA PAPER 86-0291] p 241 A86-22687

**California Univ., Los Angeles.**
Shock modelling in transonic and supersonic flow
p 204 A86-20946

**Calspan Field Services, Inc., Arnold AFS, Tenn.**
Investigation of the development of laminar boundary-layer instabilities along a sharp cone
[AD-A159370] p 255 N86-16521

**Civil Aviation Authority, London (England).**
Evaluation of 23 inch radar viewing unit for Heathrow approach control room
[CAA-PAPER-85011] p 216 N86-16209

**Committee on Science and Technology (U. S. House).**
Noise reduction technology
[GPO-48-026] p 265 N86-17076
Controlled Impact Demonstration (CID)
[GPO-46-870] p 214 N86-17324

**Connecticut Univ., Storrs.**
An investigation of adaptive controllers for helicopter vibration and the development of a new dual controller
[NASA-CR-177377] p 239 N86-16228

## D

**Dayton Univ., Ohio.**
Passive damping, sonic fatigue and the KC-135A
p 256 N86-16625
A different approach to designed in passive damping
p 256 N86-16627

**Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Brunswick (West Germany).**
Construction of a measuring method using fiber optics and an LTN-90 laser gyro strapdown system for BO-195 helicopters
[DFVLR-MITT-85-10] p 216 N86-17333

**Duits-Nederlandse Windtunnel, North East Polder (Netherlands).**
German-Dutch wind tunnel (DNW). Present and future applications for industrial developments
p 242 N86-16235
Aeroacoustic calibration of the German-Dutch Wind Tunnel (DNW) open jet
[DNW-TR-82-03] p 242 N86-16236
Acoustic evaluation of the German-Dutch Wind Tunnel (DNW) shear layer correction using a model jet
[DNW-TR-82-04] p 242 N86-16237
Aerodynamical calibration of the German-Dutch Wind Tunnel (DNW): A review of testing techniques and results
[DNW-PA-82062] p 242 N86-16238

## E

**Engineering Sciences Data Unit, London (England).**
Estimation of drag due to inoperative turbo-jet and turbo-fan engines using data item nos. 81009 and 84004
[ESDU-84005] p 211 N86-17305
Estimation of sideforce, yawing moment and rolling moment derivatives due to rate of yaw for complete aircraft at subsonic speeds
[ESDU-84002] p 240 N86-17357

**European Space Agency, Paris (France).**
Investigation of the aerodynamic forces on bluff bodies at high Reynolds numbers
[ESA-TT-914] p 209 N86-16206
Hot corrosion in aircraft engines
[ESA-TT-887] p 237 N86-16227
Flight dynamics and aircraft piloting
[ESA-TT-874] p 240 N86-16229
Maximum-likelihood estimation of parameters in linear systems from flight test data. A FORTRAN program
[ESA-TT-896] p 264 N86-16989

## F

**Flow Research, Inc., Kent, Wash.**
Propeller design by optimization
[AIAA PAPER 86-0081] p 232 A86-19678

**Fuji Heavy Industries Ltd., Utsunomiya (Japan).**
Application of computational aerodynamics to wing design p 226 N86-17297

## G

**General Electric Co., Cincinnati, Ohio.**
Evaluation of fuel preparation systems for lean premixing-prevaporizing combustors
[ASME PAPER 85-GT-137] p 235 A86-22081
Spanwise redistribution of energy and loss in an axial flow compressor by wake centrifugation
[AD-A159312] p 237 N86-16222

**Grumman Aerospace Corp., Bethpage, N.Y.**
Control of a forward-swept-wing configuration dominated by flight dynamic/aeroelastic interactions
p 239 A86-20237

## I

**Illinois Univ., Urbana-Champaign.**
Error propagation in a digital avionic processor: A simulation-based study
[NASA-CR-176501] p 232 N86-17351

**Imperial Coll. of Science and Technology, London (England).**

The two-fluid model of turbulent combustion applied to an idealised one-dimensional, unsteady, confined, pre-mixed flame [PDR/CFDU/IC/21] p 247 N86-18315

**Informatics General Corp., Palo Alto, Calif.**

Unsteady transonics of a wing with tip store [AIAA PAPER 86-0010] p 198 A86-19633

Numerical simulation of transonic separated flows over low-aspect ratio wings [AIAA PAPER 86-0508] p 206 A86-22704

**Institute for Perception RVO-TNO, Soesterberg (Netherlands).**

Application of active noise reduction for hearing protection and speech intelligibility improvement [IZF-1985-7] p 266 N86-18131

**Integrated Systems, Inc., Palo Alto, Calif.**

Flight test maneuver modeling and control [AIAA PAPER 86-0426] p 219 A86-19868

## J

**Jet Propulsion Lab., California Inst. of Tech., Pasadena.**

Simulation and analysis of natural rain in a wind tunnel via digital image processing techniques [AIAA PAPER 86-0291] p 241 A86-22687

Quantitative determination of engine water ingestion [AIAA PAPER 86-0307] p 254 A86-22690

Research on antimisting fuel for suppression of postcrash aircraft fires [AIAA PAPER 86-0573] p 247 A86-22706

**Johns Hopkins Univ., Laurel, Md.**

Evolution and status of CFD techniques for scramjet applications [AIAA PAPER 86-0160] p 248 A86-19970

**Joint Publications Research Service, Arlington, Va.**

Establishment and use of time unification system for civil aviation p 258 N86-17648

## K

**Kansas Univ., Lawrence.**

Development of a sensitivity analysis technique for multiloop flight control systems [NASA-CR-166619] p 240 N86-17358

**Kawasaki Heavy Industries, Ltd., Akashi (Japan).**

The role of computational fluid dynamics in aeronautical engineering [REPT-2] p 257 N86-17296

**Kollsman System-Technik G.m.b.H., Munich (West Germany).**

Development of a piezoelectric quartz pressure sensor for avionics with excellent long term stability (with final demonstration of the results on a prototype) [BMFT-FB-W-85-010] p 232 N86-17353

**Kyoto Inst. of Tech. (Japan).**

Numerical analysis for steady transonic flows past an airfoil using AF scheme p 209 N86-17289

Numerical solution of viscous compressible flows past an airfoil using unconditionally stable explicit method p 210 N86-17290

## L

**Lockheed-Georgia Co., Marietta.**

Development of pneumatic thrust-deflecting powered-lift systems [AIAA PAPER 86-0476] p 219 A86-19894

Numerical simulation of the transonic flowfield for wing/nacelle configurations p 204 A86-20159

**LTV Aerospace and Defense Co., Dallas, Tex.**

A decade of reliability testing progress p 256 N86-16619

## M

**Massachusetts Inst. of Tech., Cambridge.**

Real-time measurement of ice growth during simulated and natural icing conditions using ultrasonic pulse-echo techniques [AIAA PAPER 86-0410] p 214 A86-19860

Comparison of computations and experimental data for leading edge vortices - Effects of yaw and vortex flaps [AIAA PAPER 86-0439] p 202 A86-19880

Linear-quadratic Gaussian with loop-transfer recovery methodology for the F-100 engine p 233 A86-20233

**Max-Planck-Institut fuer Stroemungsforschung, Goettingen (West Germany).**

Sound excitation during vortex-airfoil interaction [MPIS-MITT-80] p 266 N86-18130

**McDonnell Aircraft Co., St. Louis, Mo.**

Approach for service life extension of explosive devices for aircraft escape systems p 243 A86-19349

**Messerschmitt-Boelkow-Blohm G.m.b.H., Ottobrunn (West Germany).**

Air and space flight. Dream and facts [MBB-FILM-382] p 198 N86-16188

**Metraflu, Ecully (France).**

Analysis of the noise emitted by a tail rotor p 266 N86-18129

**Metropolitan Coll. of Technology, Tokyo (Japan).**

Transonic internal flow about an airfoil oscillating in pitch: Comparisons between computation and experiment p 209 N86-17278

**Minnesota Univ., Minneapolis.**

Design of an active flutter suppression system p 239 A86-20236

**Missouri Univ., Rolla.**

Investigation of chord ratio, stagger, decalage angle, and flap angle for dual wing configurations [AIAA PAPER 86-0317] p 201 A86-19810

A numerical model of acoustic choking. II - Shocked solutions p 265 A86-20795

**Mitsubishi Heavy-Industries Ltd., Tokyo (Japan).**

The comparison of the transonic airfoil calculation by NSFOIL with the wind tunnel test data at high Reynolds number p 210 N86-17295

A wing design based on the three-dimensional transonic inverse method and the comparison with the wind tunnel testing data p 226 N86-17299

## N

**Nagoya Univ. (Japan).**

Numerical analysis of transonic flow around two-dimensional airfoil by solving Navier-Stokes equations p 210 N86-17292

**National Aeronautics and Space Administration, Washington, D.C.**

Aerodynamic design trends for commercial aircraft [NASA-TM-77976] p 227 N86-17336

**National Aeronautics and Space Administration. Ames Research Center, Moffett Field, Calif.**

Unsteady transonics of a wing with tip store [AIAA PAPER 86-0010] p 198 A86-19633

Numerical modeling of rotor flows with a conservative form of the full-potential equations [AIAA PAPER 86-0079] p 198 A86-19676

The computation of steady 3-D separated flows over aerodynamic bodies at incidence and yaw [AIAA PAPER 86-0109] p 199 A86-19693

An extreme clear air turbulence incidence associated with a strong downslope windstorm [AIAA PAPER 86-0329] p 259 A86-19816

Visualization and flow surveys of the leading edge vortex structure on delta wing planforms [AIAA PAPER 86-0330] p 201 A86-19817

Three-dimensional elliptic grid generation about fighter aircraft for zonal finite-difference computations [AIAA PAPER 86-0429] p 202 A86-19871

Definition and verification of a complex aircraft for aerodynamic calculations [AIAA PAPER 86-0431] p 202 A86-19873

Development of pneumatic thrust-deflecting powered-lift systems [AIAA PAPER 86-0476] p 219 A86-19894

Evaluation of an aerodynamic-load prediction method on a STOL fighter configuration [AIAA PAPER 86-0590] p 203 A86-19966

The critical role of computational fluid dynamics in rotary-wing aerodynamics [AIAA PAPER 86-0336] p 204 A86-19871

Modeling aerodynamic responses to aircraft maneuvers - A numerical validation p 204 A86-20156

Flight testing the fixed wing configuration of the Rotor Systems Research Aircraft (RSRA) p 223 A86-21064

Scaling of helicopter main rotor noise in hover [AIAA PAPER 86-0393] p 265 A86-22699

Numerical simulation of transonic separated flows over low-aspect ratio wings [AIAA PAPER 86-0508] p 206 A86-22704

Flow field survey near the rotational plane of an advanced design propeller on a JetStar airplane [NASA-TM-86037] p 207 N86-16196

Mach number and flow-field calibration at the advanced design propeller location on the JetStar airplane [NASA-TM-84923] p 207 N86-16197

Development of a knowledge acquisition tool for an expert system flight status monitor [NASA-TM-86802] p 263 N86-16944

A simulation of rotor-stator interaction using the Euler equations and patched grids [NASA-TM-86821] p 264 N86-17014

**National Aeronautics and Space Administration. Flight Research Center, Edwards, Calif.**

The role of a real-time flight support facility in flight research programs [AIAA PAPER 86-0166] p 241 A86-19727

Dynamics and controls flight testing of the X-29A airplane [AIAA PAPER 86-0167] p 237 A86-19728

Development of a knowledge acquisition tool for an expert system flight status monitor [AIAA PAPER 86-0240] p 230 A86-19764

A flightpath overshoot flying qualities metric for the landinig task [AIAA PAPER 86-0334] p 238 A86-19820

Flight test maneuver modeling and control [AIAA PAPER 86-0426] p 219 A86-19868

Simulator evaluation of a remotely piloted vehicle visual landing task p 221 A86-20238

**National Aeronautics and Space Administration. Langley Research Center, Hampton, Va.**

Approach for service life extension of explosive devices for aircraft escape systems p 243 A86-19349

Divergence study of a high-aspect ratio, forward-swept wing [AIAA PAPER 86-0009] p 219 A86-19632

Description of and results from camera systems for recording daytime lightning strikes to an airplane in flight [AIAA PAPER 84-0020] p 230 A86-19636

Lightning strikes to a NASA airplane penetrating thunderstorms at low altitudes [AIAA PAPER 86-0021] p 213 A86-19637

Summary of a high subsonic force/pressure experiment for 58 deg cambered/twisted thick delta wings [AIAA PAPER 86-0169] p 200 A86-19730

Design of a natural laminar flow wing for a transonic corporate transport [AIAA PAPER 86-0314] p 200 A86-19807

An evaluation of leading-edge flap performance on delta and double-delta wings at supersonic speeds [AIAA PAPER 86-0315] p 201 A86-19808

Shaping of airplane fuselages for minimum drag [AIAA PAPER 86-0316] p 201 A86-19809

Experimental study of effects of forebody geometry on high angle of attack static and dynamic stability [AIAA PAPER 86-0331] p 238 A86-19818

Exploratory investigation of deflectable forebody strakes for high angle of attack yaw control [AIAA PAPER 86-0333] p 238 A86-19819

Laboratory study of the effects of sidewall treatment, source directivity and temperature on the interior noise of a light aircraft fuselage [AIAA PAPER 86-0390] p 219 A86-19851

Comparison of computations and experimental data for leading edge vortices - Effects of yaw and vortex flaps [AIAA PAPER 86-0439] p 202 A86-19880

Evolution and status of CFD techniques for scramjet applications [AIAA PAPER 86-0160] p 248 A86-19970

Laboratory study of cabin acoustic treatments installed in an aircraft fuselage p 221 A86-20158

Design of an active flutter suppression system p 239 A86-20236

Repeatability of mixed-mode adhesive debonding p 249 A86-20638

Vortex wake alleviation studies with a variable twist wing [NASA-TP-2442] p 197 N86-16187

Aerodynamic characteristics of a high-wing transport configuration with a over-the-wing nacelle-pylon arrangement [NASA-TP-2497] p 207 N86-16193

Pressure distributions from high Reynolds number tests of a Boeing BAC 1 airfoil in the Langley 0.3-meter transonic cryogenic tunnel [NASA-TM-87600] p 208 N86-16199

Some comparisons of US and USSR aircraft design developments [NASA-TM-87611] p 214 N86-16208

Supersonic aerodynamic characteristics of some reentry concepts for angles of attack to 90 deg [NASA-TM-87645] p 243 N86-16243

Image processing of aerodynamic data [NASA-TM-87629] p 255 N86-16553

Stress analysis of 27% scale model of AH-64 main rotor hub [NASA-TM-87625] p 256 N86-16613

Comparison of advanced turboprop and conventional jet and propeller aircraft flyover noise annoyance: Preliminary results [NASA-TM-87637] p 265 N86-17077

Separation of airborne and structureborne noise radiated by plates constructed of conventional and composite materials with applications for prediction of interior noise paths in propeller driven aircraft [NASA-TM-87414] p 265 N86-18121

**National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.**

Lubrication and performance of high-speed rolling-element bearings p 248 A86-19375

The effect of acoustic reflections on combustor noise measurements p 265 A86-20364

A review and analysis of boundary layer transition data for turbine application [ASME PAPER 85-GT-83] p 251 A86-22054

NASA Lewis Research Center/university graduate research program on engine structures [ASME PAPER 85-GT-159] p 252 A86-22084

Velocity and temperature decay characteristics of inverted-profile jets [AIAA PAPER 86-0312] p 206 A86-22693

Formation and characterization of simulated small droplet icing clouds [AIAA PAPER 86-0409] p 254 A86-22700

Validation of viscous and inviscid computational methods for turbomachinery components [NASA-TM-87193] p 207 N86-16194

A numerical simulation of the inviscid flow through a counter-rotating propeller [NASA-TM-87200] p 207 N86-16195

Study of ice accretion on icing wind tunnel components [NASA-TM-87095] p 242 N86-16232

Progress in the Lewis Research Center Altitude Wind Tunnel (AWT) Modeling Program [NASA-TM-87194] p 242 N86-16233

Mass balancing of hollow fan blades [NASA-TM-87197] p 255 N86-16611

**National Aeronautics and Space Administration. Marshall Space Flight Center, Huntsville, Ala.**

Measurements of rotating bubble shapes in low-gravity environment p 251 A86-21996

## T

**Technische Hogeschool, Delft (Netherlands).**
An experimental investigation of the entrainment into a leading-edge vortex
[VTH-LR-332] p 208 N86-16203
Calculations of transonic flows around single and multielement airfoils on a small computer
[REPT-84-48] p 208 N86-16205
Design and evaluation of an instrumentation system for measurements in nonsteady symmetrical flight conditions with the Hawker Hunter MK 7
[VTH-LR-308] p 232 N86-16215
Low speed aerodynamic characteristics of a two-dimensional sail wing with adjustable slack of the sail
[VTH-LR-307] p 211 N86-17314
Design and fabrication of an advanced composite cellular wing box
[VTH-LR-315] p 227 N86-17344
Lecture notes on fatigue, static tensile strength and stress corrosion of aircraft materials and structures. Part 2: Figures
[VTH-LR-390-PT-2] p 227 N86-17345
Design of hat-stiffened composite panels under uniaxial compression and shear. Minimum mass optimization based on a simplified theory
[VTH-LR-312] p 259 N86-17806

**Texas A&M Univ., College Station.**
A numerical method for the design and analysis of counter-rotating propellers
[AIAA PAPER 84-1205] p 233 A86-20369

**Transportation Research Board, Washington, D.C.**
Surface properties-vehicle interaction
[PB85-242576] p 255 N86-16428

## U

**United Technologies Research Center, East Hartford, Conn.**
Isolated and interacting round parallel heated jets
[AIAA PAPER 86-0281] p 264 A86-19790
Long term deposit formation in aviation turbine fuel at elevated temperature
[AIAA PAPER 86-0525] p 243 A86-19929

## V

**Vickers PLC, Hampshire (England).**
Fatigue testing of tube to node butt welds envisaged for RAE Bedford flight simulator
[REPT-23480/2/85] p 257 N86-16674

**Vigyan Research Associates, Inc., Hampton, Va.**
Shaping of airplane fuselages for minimum drag
[AIAA PAPER 86-0316] p 201 A86-19809
Exploratory investigation of deflectable forebody strakes for high angle of attack yaw control
[AIAA PAPER 86-0333] p 238 A86-19819

**Virginia Polytechnic Inst. and State Univ., Blacksburg.**
Dual rectangular jets from a flat plate in a crossflow
[AIAA PAPER 86-0477] p 255 A86-22703

## W

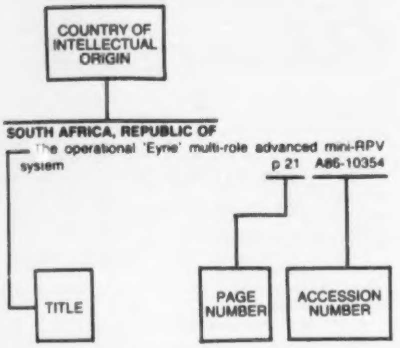
**Washington Univ., St. Louis, Mo.**
Effect of dynamic stall and elastic parameters on the fundamental mechanisms of helicopter vibrations
[AD-A160022] p 237 N86-17355

**Welding Inst., Cambridge (England).**
Fatigue testing of tube to node butt welds envisaged for RAE Bedford flight simulator
[REPT-23480/2/85] p 257 N86-16674

**Wichita Univ., Kans.**
Designing an electro-impulse de-icing system
[AIAA PAPER 86-0545] p 220 A86-19940

# FOREIGN TECHNOLOGY INDEX

### Typical Foreign Technology Index Listing



COUNTRY OF INTELLECTUAL ORIGIN
SOUTH AFRICA, REPUBLIC OF
The operational 'Eyrie' multi-role advanced mini-RPV system p 21 A86-10354
TITLE
PAGE NUMBER
ACCESSION NUMBER

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section.

## A

**AUSTRALIA**

A case study in fatigue life extension - The main spar of RAAF Mirage IIIO wings p 225 A86-22165

A FORTRAN program for the determination of unsteady airforces on general combinations of interfering lifting surfaces oscillating in subsonic flow [ARL-STRUCT-R-412] p 206 N86-16191

## C

**CANADA**

The damage tolerance approach in the type approval process p 220 A86-20036

Helicopter fatigue monitoring using a single channel recorder p 220 A86-20038

Assessing cost-effective weight saving in aircraft operations p 220 A86-20039

Testing Canadian unique features of the CF-18 - The first year p 223 A86-21060

A Synthetic Aperture Radar (SAR) for commercial applications p 250 A86-21246

Fuel property effects upon exhaust smoke and the weak extinction characteristics of the Pratt and Whitney PT6A-65 engine [ASME PAPER 85-GT-27] p 234 A86-22018

Flame temperature estimation of conventional and future jet fuels [ASME PAPER 85-GT-31] p 246 A86-22020

**CHINA, PEOPLE'S REPUBLIC OF**

Fatigue life prediction under complex load using local strain approach and relative Miner's rule p 249 A86-20173

Measurement of elastic-plastic strain field at the curve surface crack tip p 249 A86-20175

Dynamic analysis of complex composite rotor systems with substructure transfer matrix method [ASME PAPER 85-GT-74] p 235 A86-22049

An improved simple method for designing optimum annular diffusers [ASME PAPER 85-GT-126] p 235 A86-22075

Investigation of jet-filming airblast atomizer [ASME PAPER 85-GT-185] p 252 A86-22099

Calculation of external and internal transonic flow field of a three-dimensional shielded S-shaped inlet p 205 A86-22303

Multi-knot Boolean sum interpolating surface interactive design of aircraft configuration p 263 A86-22305

Recursive instrumental variable algorithms for modal parameter estimation of structural system p 263 A86-22306

Terrain following avoidance technique of very low altitude penetration p 239 A86-22309

A vortex lattice method for jet wing performance with nonlinear wake and tip flow p 205 A86-22311

Gust alleviation using combined control laws p 239 A86-22317

Calculation of misalignment error of multi-joint holes of wing to fuselage p 253 A86-22318

Calculation of supersonic flows around a three-dimensional wing and a waisted body with characteristic method in stream surface coordinates p 206 A86-22319

## F

**FRANCE**

Delamination threshold and loading effect in fiber glass epoxy composite p 244 A86-20636

Local area command/control networks: The design of an on-board network - ANTINEA p 215 A86-21327

A redundant strapdown reference for advanced aircraft flight control systems p 239 A86-21840

Life cycle cost and availability in military aeronautics p 266 A86-21872

Transonic blade to blade calculations in an axial, radial or mixed flow cascade equipped with splitter blades [ASME PAPER 85-GT-86] p 205 A86-22057

Problems found when introducing new materials [SNIAS-852-551-101] p 198 N86-16190

Flight dynamics and aircraft piloting [ESA-TT-874] p 240 N86-16229

Nondestructive inspection: An efficient investment [SNIAS-852-430-110] p 247 N86-16276

Arenyl: A soluble mold technology [SNIAS-852-430-111] p 247 N86-16277

The applications of composite materials in the aeronautical domain [SNIAS-852-551-103] p 247 N86-16279

AGARD Corrosion Handbook. Volume 1: Corrosion, causes and case histories [AGARD-AG-278-VOL-1] p 248 N86-16374

The deiced super Puma [SNIAS-852-210-104] p 215 N86-17328

Search and Rescue (SAR) System developed as part of the contract signed with the Irish Air Corps for the supply of 365 F Dauphin aircraft [SNIAS-852-210-105] p 215 N86-17329

Systems safety: Phantom or reality [SNIAS-852-422-103] p 215 N86-17330

Critical analysis of turbulence restitution from acceleration measurements [ONERA-RT-3/3567-RY-C40-R] p 227 N86-17340

Strategies for dynamic modeling of a helicopter structure [SNIAS-852-210-101] p 228 N86-17350

Evaluation of the Ciba-Geigy R6376 IM6 prepreg [DGT-26.649] p 248 N86-17485

Study of composite material curing molds [DGT-26.817] p 248 N86-17486

Composite materials: A source of innovation [SNIAS-852-430-113] p 248 N86-17493

Design of nonaxysymmetric structures (turbojet engine nacelle element) [SNIAS-852-430-119] p 248 N86-17498

Feasibility study of a device to control aircraft electromagnetic protection [ONERA-RS-10/3466-PY] p 257 N86-17637

Description of a nondestructive facility using holographic interferometry [SNIAS-852-430-105] p 258 N86-17726

Analysis of the noise emitted by a tail rotor p 266 N86-18129

Helicopter internal noise treatment. Recent methodolgies and practical applications [SNIAS-852-210-102] p 266 N86-18133

## G

**GERMANY,FEDERAL REPUBLIC OF**

Endurance increase by cyclic control p 221 A86-20235

Geometry generation for transonic design p 221 A86-20932

Euler solvers as an analysis tool for aircraft aerodynamics p 204 A86-20939

General Aviation and Regional Air Traffic - Components of the Traffic System, Symposium, Friedrichshafen, West Germany, March 28, 29, 1985, Reports p 197 A86-21325

PM techniques for making near-net-shape titanium alloy components p 246 A86-21756

Symposium Gyro Technology 1984; Proceedings of the Symposium, Universitaet Stuttgart, West Germany, September 11, 12, 1984 p 250 A86-21826

Interdependence of centrifugal compressor blade geometry and relative flow field [ASME PAPER 85-GT-85] p 251 A86-22056

3-D design of turbine airfoils [ASME PAPER 85-GT-188] p 236 A86-22101

Air and space flight. Dream and facts [MBB-FILM-382] p 198 N86-16188

Investigation of the aerodynamic forces on bluff bodies at high Reynolds numbers [ESA-TT-914] p 209 N86-16206

Hot corrosion in aircraft engines [ESA-TT-887] p 237 N86-16227

Maximum-likelihood estimation of parameters in linear systems from flight test data. A FORTRAN program [ESA-TT-896] p 264 N86-16989

Activities in air traffic control p 216 N86-17331

Construction of a measuring method using fiber optics and an LTN-90 laser gyro strapdown system for BO-105 helicopters [DFVLR-MITT-85-10] p 216 N86-17333

Aerodynamic design trends for commercial aircraft [NASA-TM-77976] p 227 N86-17338

Environment-friendly propeller aircraft with a maximum weight of 5700 kg, and motor gliders: Publication of the noise values p 227 N86-17341

Development of a piezoelectric quartz pressure sensor for avionics with excellent long term stability (with final demonstration of the results on a prototype) [BMFT-FB-W-85-010] p 232 N86-17353

Sound excitation during vortex-airfoil interaction [MPIS-MITT-80] p 266 N86-18130

## I

**ITALY**

Radars in air traffic control - A status report p 216 A86-21607

## J

**JAPAN**

Computation of dynamic stall of NACA0012 airfoil by block pentadiagonal matrix scheme [AIAA PAPER 86-0116] p 199 A86-19697

Practical applications of new LU-ADI scheme for the three-dimensional Navier-Stokes computation of transonic viscous flows [AIAA PAPER 86-0513] p 203 A86-19922

Dispersion process of jet engine exhaust plume. II - Buoyant jet p 234 A86-20448

Recent developments in carbon fibre composite p 244 A86-21296

Production and development of secondary flows and losses within a three dimensional turbine stator cascade
[ASME PAPER 85-GT-217] p 205 A86-22115

Numerical simulation of the leading-edge separation vortex over delta wing p 209 N86-17271

Numerical simulation of unsteady flow around an airfoil by finite difference solution of Navier-Stokes equations

Transonic internal flow about an airfoil oscillating in pitch: Comparisons between computation and experiment
p 209 N86-17278

Investigations on efficient numerical method for subsonic lifting surfaces p 209 N86-17285

Numerical analysis for steady transonic flows past an airfoil using AF scheme p 209 N86-17289

Numerical solution of viscous compressible flows past an airfoil using unconditionally stable explicit method
p 210 N86-17290

Numerical analysis about flow over an aerofoil with a large angle of attack p 210 N86-17291

Numerical analysis of transonic flow around two-dimensional airfoil by solving Navier-Stokes equations p 210 N86-17292

Analysis of high Reynolds number transonic flow around an airfoil p 210 N86-17293

Validation and comparison with experiment of a high Reynolds number transonic flow airfoil analysis code NSFOIL p 210 N86-17294

The comparison of the transonic airfoil calculation by NSFOIL with the wind tunnel test data at high Reynolds number p 210 N86-17295

The role of computational fluid dynamics in aeronautical engineering
[REPT-2] p 257 N86-17296

Application of computational aerodynamics to wing design p 226 N86-17297

A numerical solution of the transonic integral equation and its application to three-dimensional transonic wing design p 226 N86-17298

A wing design based on the three-dimensional transonic inverse method and the comparison with the wind tunnel testing data p 226 N86-17299

The analysis of practical transonic swept wings with and without boundary layer effects p 211 N86-17300

Estimation of divergence and flutter boundaries on supersonic plate wing models from subcritical random responses due to air turbulence
[NAL-TR-856] p 211 N86-17308

### N

**NETHERLANDS**

Development of an airborne CCD scanner for land and sea applications p 231 A86-21163

Hardware/software FMEA applied to airplane safety
p 253 A86-22396

Activities report in aeronautics p 198 N86-16189

Implicit finite-difference methods for the calculation of unsteady transonic potential flow around two-dimensional airfoils: A discussion
[NLR-MP-83063-U] p 208 N86-16202

An experimental investigation of the entrainment into a leading-edge vortex
[VTH-LR-332] p 208 N86-16203

Application of time-linearized methods of oscillating wings in transonic flow and flutter
[NLR-MP-84077-U] p 208 N86-16204

Calculations of transonic flows around single and multielement airfoils on a small computer
[REPT-84-48] p 208 N86-16205

Fatigue life monitoring of aircraft
[NLR-MP-83069-U] p 226 N86-16211

Design and evaluation of an instrumentation system for measurements in nonsteady symmetrical flight conditions with the Hawker Hunter MK 7
[VTH-LR-308] p 232 N86-16215

Simulation of a six degrees of freedom flight simulator motion system
[UA-00-39] p 241 N86-16230

German-Dutch wind tunnel (DNW). Present and future applications for industrial developments
p 242 N86-16235

Aeroacoustic calibration of the German-Dutch Wind Tunnel (DNW) open jet
[DNW-TR-82-03] p 242 N86-16236

Acoustic evaluation of the German-Dutch Wind Tunnel (DNW) shear layer correction using a model jet
[DNW-TR-82-04] p 242 N86-16237

Aerodynamical calibration of the German-Dutch Wind Tunnel (DNW): A review of testing techniques and results
[DNW-PA-82062] p 242 N86-16238

Report of the Working Group for Sensitivity Analysis and Zoning Calculations (GAZOB) p 259 N86-16749

Analysis and conclusions of the working Group for Sensitivity Analysis and Zoning Calculations (GAZOB)
p 259 N86-16750

Noise nuisance calculations for Schiphol Airport on behalf of the Sensitivity Analysis and Zoning Calculations Working Group (GAZOB)
[NLR-TR-85034-U] p 260 N86-16751

Markov jump-diffussion models and decision-making free filtering
[NLR-MP-83067-U] p 264 N86-17046

Aeroacoustic research in the Netherlands related to aircraft development
[NLR-MP-84049-U] p 265 N86-17081

Activities report in aircraft development and astronautics p 267 N86-17233

Low speed aerodynamic characteristics of a two-dimensional sail wing with adjustable slack of the sail
[VTH-LR-307] p 211 N86-17314

Application of a constrained inverse method in the aerodynamic design of a low speed wing-slat configuration
[NLR-TR-83123-U] p 211 N86-17320

A system for computer aided analysis and design of multielement airfoils: MAD
[NLR-TR-83136-U] p 212 N86-17321

Hardware/software Failure Mode Effect Analysis (FMEA) applied to airplane safety
[NLR-MP-84073-U] p 215 N86-17325

A sophisticated tracking algorithm for Air Traffic Control (ATC) surveillance radar data
[NLR-MP-84004-U] p 216 N86-17334

Comparison of a jump-diffusion tracker with a Kalman tracker: An evaluation with emphasis on air traffic control
[NLR-TR-83063-U] p 216 N86-17335

Damage-tolerant aircraft design
[NLR-MP-84005-U] p 227 N86-17342

Helicopter-ship qualification testing
[NLR-MP-84062-U] p 227 N86-17343

Design and fabrication of an advanced composite cellular wing box
[VTH-LR-315] p 227 N86-17344

Lecture notes on fatigue, static tensile strength and stress corrosion of aircraft materials and structures. Part 2: Figures
[VTH-LR-360-PT-2] p 227 N86-17345

Operational application of the STALINS method for measuring take-off and landing trajectories
[NLR-TR-83010-U] p 227 N86-17346

Three-dimensional flight-path reconstruction by means of spline approximation
[NLR-TR-83091-U] p 228 N86-17347

Estimation of load exceedances of an aircraft under carriage with nonlinear properties excited by random runway unevenness
[NLR-TR-84030-U] p 228 N86-17348

Optimization in design processes: An informatics point of view
[NLR-MP-84074-U] p 228 N86-17349

The application of sensors in light tests
[NLR-MP-84056-U] p 232 N86-17352

Reliability aspects of software for digital avionics
[NLR-TR-82126-U] p 232 N86-17354

Activities report in aerospace research, with data concerning the scientific committee NLR-NIVR, international cooperation concerning AGARD, DNW, GARTEUR and cooperation with Indonesia
p 257 N86-17588

A survey of numerical methods for the calculation of inviscid, possibly rotational Euler flows around aeronautical configurations
[NLR-TR-83130-U] p 258 N86-17699

Boundary layer calculations on the leeward surface of a slender delta wing at incidence
[NLR-TR-84001-U] p 258 N86-17700

Quadrinomial distribution for the characterization of nondestructive inspection (NDI) reliability
[NLR-MP-84064-U] p 258 N86-17774

Design of hat-stiffened composite panels under uniaxial compression and shear. Minimum mass optimization based on a simplified theory
[VTH-LR-312] p 259 N86-17806

Fatigue rated fastener systems in aluminum alloy structural joints
[NLR-MP-83045-U] p 259 N86-17809

Noise assessment around Schiphol airport (the Netherlands) in 1981
[NLR-TR-82034-U] p 260 N86-17915

Computer Aided Design (CAD) at the National Aerospace Laboratory (Netherlands) with the accent on aircraft flight control systems
[NLR-MP-84032-U] p 264 N86-18030

An efficient filter for abruptly changing systems
[NLR-MP-84071-U] p 264 N86-18056

Application of active noise reduction for hearing protection and speech intelligibility improvement
[IZF-1985-7] p 266 N86-18131

Engineering Data Interactive Presentation and Analysis System (EDIPAS): A general approach to engineering data management and analysis applied to wind tunnel testing
[NLR-MP-83057-U] p 267 N86-18252

**NORWAY**

The effect of water ingress on buoyancy and thermal quality of survival suits p 261 A86-19333

### S

**SWEDEN**

Camera flight tests and image evaluation
p 230 A86-19591

Transonic wind tunnel tests of a swept supercritical wing-body model, PT 8
[FFA-TN-1982-24] p 211 N86-17316

**SWITZERLAND**

Canard Mirage on test p 225 A86-22261

### U

**U.S.S.R.**

A solution to the problem of flow past wings with allowance for flow separation on the basis of a system of Euler equations p 205 A86-21345

Establishment and use of time unification system for civil aviation p 258 N86-17648

**UNITED ARAB REPUBLIC**

Control methodology for stochastic system characteristics modulation
[AIAA PAPER 86-0335] p 262 A86-19821

**UNITED KINGDOM**

A new generation advanced I.R. Linescan Sensor system p 229 A86-19585

Evolution of real time airborne reconnaissance
p 229 A86-19586

Towards robust image matching algorithms
p 230 A86-19620

Small scale wind tunnel testing of model propellers
[AIAA PAPER 86-0392] p 233 A86-19853

The electrodynamic operation of electro-impulse deicing systems
[AIAA PAPER 86-0547] p 220 A86-19941

A new method of analyzing wave propagation in periodic structures - Applications to periodic Timoshenko beams and stiffened plates p 249 A86-20792

Elimination of buffeting on the rear fuselage of the Hercules tanker p 221 A86-20822

Computational methods in viscous flows
p 250 A86-21026

Probe and drogue refuelling large receiver aircraft
p 223 A86-21062

Plessey displays in air traffic control
p 216 A86-21608

The quantification and improvement of the thermal stability of aviation turbine fuel
[ASME PAPER 85-GT-33] p 247 A86-22022

The effect of fuel composition upon combustion performance in a Rolls Royce Tyne combustor
[ASME PAPER 85-GT-39] p 234 A86-22028

Full coverage discrete hole film cooling - The influence of hole size
[ASME PAPER 85-GT-47] p 251 A86-22035

Heat transfer measurements with film cooling on a turbine blade profile in cascade
[ASME PAPER 85-GT-117] p 251 A86-22070

Developing concepts in the rotordynamic analysis of aero gas turbines
[ASME PAPER 85-GT-230] p 236 A86-22126

The little turbine business p 236 A86-22200

Evaluation of 23 inch radar viewing unit for Heathrow approach control room
[CAA-PAPER-85011] p 216 N86-16209

The mechanical design of gas turbine blading in cast superalloys
[PNR-90247] p 237 N86-16223

An analysis of rig test disc failures
[PNR-90276] p 237 N86-16224

Certification of aeroengines fitted with full authority digital control
[PNR-90287] p 237 N86-16225

Is the traditional 150 hour endurance test outdated?
[PNR-90288] p 237 N86-16226

The material development, component manufacture, and post-service evaluation of RB211-524 cowl doors utilizing carbon fibre composite materials
[PNR-90275] p 247 N86-16273

The two-fluid model of turbulent combustion applied to an idealised one-dimensional, unsteady, confined, pre-mixed flame
[PDR/CFDU/IC/21] p 247 N86-16315

The technical development of cooled gas turbine blades
[PNR-90292] p 255 N86-16595
Fatigue testing of tube to node butt welds envisaged for RAE Bedford flight simulator
[REPT-23480/2/85] p 257 N86-16674
Aircraft noise control: Prospects for the 21st century
[PNR-90272] p 260 N86-16757
Multivariable control
[OUEL-1599/85] p 264 N86-17007
Estimation of drag due to inoperative turbo-jet and turbo-fan engines using data item nos. 81009 and 84004
[ESDU-84005] p 211 N86-17305
Studies of the flow field near a NACA 4412 aerofoil at nearly maximum lift
[RAE-TM-AERO-2026] p 211 N86-17307
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 1: Background and fatigue evaluation
[RAE-TR-84084] p 226 N86-17336
Standardised fatigue loading sequences for helicopter rotors (Helix and Felix). Part 2: Final definition of Helix and Felix
[RAE-TR-84085] p 226 N86-17337
Estimation of sideforce, yawing moment and rolling moment derivatives due to rate of yaw for complete aircraft at subsonic speeds
[ESDU-84002] p 240 N86-17357
Hot Gas Laboratory twin nozzle calibration
[BAE-ARG-200] p 258 N86-17666
A smoke generator for the absolute calibration of gas turbine engine smoke sampling and measuring systems
[RAE-TM-P-1044] p 258 N86-17702

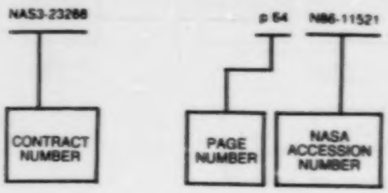
Flight stability and controllability. II - Aircraft longitudinal stability p 239 A86-21318

# CONTRACT NUMBER INDEX

**Typical Contract Number Index Listing**



Listings in this index are arranged alphanumerically by contract number. Under each contract number, the accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order with the AIAA accession numbers appearing first. The accession number denotes the number by which the citation is identified in the abstract section. Preceding the accession number is the page number on which the citation may be found.

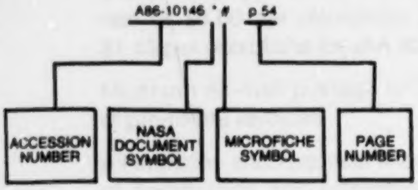
# ACCESSION NUMBER INDEX

### Typical Accession Number Index Listing



Listings in this index are arranged alphanumerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

# AVAILABILITY OF CITED PUBLICATIONS

## IAA ENTRIES (A86-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at $10.00 per document (up to 50 pages), additional pages $0.25 each. Microfiche(1) of documents announced in *IAA* are available at the rate of $4.00 per microfiche on demand. Standing order microfiche are available at the rate of $1.45 per microfiche for *IAA* source documents and $1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is $2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

## STAR ENTRIES (N86-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Document Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

---

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of $1.50 each, postage free.

Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address.

Other availabilities: If the publication is available from a source other than the above, the publisher and his address will be displayed entirely on the availability line or in combination with the corporate author line.

## GENERAL AVAILABILITY

All publications abstracted in this bibliography are available to the public through the sources as indicated in the *STAR Entries* and *IAA Entries* sections. It is suggested that the bibliography user contact his own library or other local libraries prior to ordering any publication inasmuch as many of the documents have been widely distributed by the issuing agencies, especially NASA.

## PUBLIC COLLECTIONS OF NASA DOCUMENTS

**DOMESTIC:** NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

**EUROPEAN:** An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA — Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

### FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

## STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 86-914100 at the price of $7.00 domestic and $14.00 foreign—includes annual index. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.

N. S. EISS, JR., J. P. WIGHTMAN, D. R. GILLIAM, and E. J. SIOCHI Apr. 1985 191 p refs
(Contract NAG1-300)
(NASA-CR-176231; NAS 1.26:176231) Avail: NTIS HC A09/MF A01 CSCL 01C

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

**AERODYNAMIC DESIGN CONSIDERATIONS FOR EFFICIENT HIGH-LIFT SUPERSONIC WINGS**
D. S. MILLER and R. M. WOOD (NASA, Langley Research Center, Hampton, VA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-4076)

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

# FEDERAL DEPOSITORY LIBRARY PROGRAM

The Federal Depository Library Program provides Government publications to designated libraries throughout the United States. The Regional Depository Libraries listed below receive and retain at least one copy of nearly every Federal Government publication, either in printed or microfilm form, for use by the general public. These libraries provide reference services and inter-library loans; however, they are *not* sales outlets. You may wish to ask your local library to contact a Regional Depository to help you locate specific publications, or you may contact the Regional Depository yourself.

## ACCESSION NUMBER RANGES

Accession numbers cited in this Supplement fall within the following ranges.

| | |
|---|---|
| STAR (N-10000 Series) | N86-18284 – N86-20340 |
| IAA (A-10000 Series) | A86-22714 – A86-26299 |

This bibliography was prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by RMS Associates.

NASA SP-7037(201)

# AERONAUTICAL ENGINEERING

## A CONTINUING BIBLIOGRAPHY WITH INDEXES

## (Supplement 201)

A selection of annotated references to unclassified reports and journal articles that were introduced into the NASA scientific and technical information system and announced in May 1986 in

- *Scientific and Technical Aerospace Reports (STAR)*
- *International Aerospace Abstracts (IAA).*

NASA Scientific and Technical Information Branch 1986
**National Aeronautics and Space Administration**
Washington, DC

This supplement is available from the National Technical Information Service (NTIS), Springfield, Virginia 22161, price code A06.

# INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 438 reports, journal articles, and other documents originally announced in May 1986 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

# TABLE OF CONTENTS

Page

**Category 01 Aeronautics (General)** 269

**Category 02 Aerodynamics** 270

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**Category 03 Air Transportation and Safety** 279

Includes passenger and cargo air transport operations; and aircraft accidents.

**Category 04 Aircraft Communications and Navigation** 281

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

**Category 05 Aircraft Design, Testing and Performance** 283

Includes aircraft simulation technology.

**Category 06 Aircraft Instrumentation** 296

Includes cockpit and cabin display devices; and flight instruments

**Category 07 Aircraft Propulsion and Power** 299

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

**Category 08 Aircraft Stability and Control** 305

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

**Category 09 Research and Support Facilities (Air)** 308

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

**Category 10 Astronautics** 311

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

**Category 11 Chemistry and Materials** 312

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

**Category 12 Engineering** 314

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.

**Category 13 Geosciences** 322

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.

**Category 14 Life Sciences** 326

Includes sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

**Category 15 Mathematics and Computer Sciences** 329

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

**Category 16 Physics** 331

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

**Category 17 Social Sciences** 333

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

**Category 18 Space Sciences** 333

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.

**Category 19 General** N.A.

**A FUNDAMENTAL STUDY OF THE STICKING OF INSECT RESIDUES TO AIRCRAFT WINGS Annual Technical Report**
N. S. EISS, JR., J. P. WIGHTMAN, D. R. GILLIAM, and E. J. SIOCHI Apr. 1985 191 p refs
(Contract NAG1-300)
(NASA-CR-176231; NAS 1.26:176231) Avail: NTIS HC A09/MF A01 CSCL 01C

The aircraft industry has long been concerned with the increase of drag on airplanes due to fouling of the wings by insects. The present research studied the effects of surface energy and surface roughness on the phenomenon of insect sticking. Aluminum plates of different roughnesses were coated with thin films of polymers with varying surface energies. The coated plates were attached to a custom jig and mounted on top of an automobile for insect collection. Contact angle measurements, X-ray photoelectron spectroscopy and specular reflectance infrared spectroscopy were used to characterize the surface before and after the insect impact experiments. Scanning electron microscopy showed the topography of insect residues on the exposed plates. Moments were calculated in order to find a correlation between the parameters studied and the amount of bugs collected on the plates. An effect of surface energy on the sticking of insect residues was demonstrated.

**AERODYNAMIC DESIGN CONSIDERATIONS FOR EFFICIENT HIGH-LIFT SUPERSONIC WINGS**
D. S. MILLER and R. M. WOOD (NASA, Langley Research Center, Hampton, VA) AIAA, Applied Aerodynamics Conference, 3rd, Colorado Springs, CO, Oct. 14-16, 1985. 9 p. refs
(AIAA PAPER 85-4076)

A previously developed technique for selecting a design space for efficient supersonic wings is reviewed; this design-space concept is expanded to include thickness and camber effects and is evaluated for cambered wings at high-lift conditions. The original design-space formulation was based on experimental upper-surface and lower-surface normal-force characteristics for flat, uncambered delta wings; it is shown that these general characteristics hold for various thickness distributions and for various amounts of leading-edge camber. The original design-space formulation was also based on the assumption that the combination of Mach number and leading-edge sweep which would produce an equal division of flat-wing lift between the upper and lower surface would also be the proper combination to give the best cambered-wing performance. Using drag-due-to-lift factor as a measure of performance, for high-lift conditions cambered-wing performance is shown to significantly increase as conditions approach the design space; this correlation is demonstrated for both subcritical and supercritical flows.

## 01

## AERONAUTICS (GENERAL)

**A86-23760**

**TESTABILITY OF AIRCRAFT [KONTROLOVATELNOST LETOUNU]**

J. VOLNY Zpravodaj VZLU (ISSN 0044-5355), no. 4, 1985, p. 227-231. In Czech.

The requirements for aircraft testability that are essential for the efficient maintenance and repair are summarized. In particular, attention is given to the philosophy of aircraft maintenance, maintenance scheduling, and methods, as well as to the relationship between reliability, testability, and the accessibility of aircraft parts and components during maintenance. The discussion also covers criteria for selecting a test method and the special features of aircraft intended for short-haul operation affecting the selection of the test procedure. Finally, the principal requirements for aircraft test equipment are examined. V.L.

**A86-25023**

**FUTURE HELICOPTER DEVELOPMENTS [ZUKUENFTIGE HUBSCHRAUBER-ENTWICKLUNGEN]**

P. HAMEL and B. GMELLIN (DFVLR, Institut fuer Flugmechanik, Brunswick, West Germany) DFVLR-Nachrichten (ISSN 0011-4901), Nov. 1985, p. 56-61. In German. refs

In the future, helicopters will have to satisfy very exacting demands with respect to both civil and military applications. The required enhancement of helicopter performance will be feasible on the basis of an increasing integration of new technologies. Related developments will include the employment of digital-electrical and digital-optical data transmission, microcomputer technology, and sensor and display technology. A higher-level objective of research in the area of flight mechanics is related to an evaluation of improvement possibilities regarding the mission-dependent flight characteristics and performance of helicopters which are more and more controlled automatically, taking into account the assurance of flight safety. Attention is given to a control system for automatic operations in the case of selected flight maneuvers, questions regarding the risks involved in the integration of new technologies, the role of wind tunnel simulation in connection with the consideration of new rotor systems, and the role of the pilot in the control of the helicopter. G.R.

**A86-25176#**

**RELIABILITY AND STRUCTURAL INSPECTION PROGRAM FOR TRANSPORT AEROPLANES**

G. FUJIWARA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 372, 1985, p. 1-11. In Japanese. refs

The principle and characteristics of the damage detection rating system for the structural inspection of transport aircraft are reviewed. The system consists of damage tolerance rating, environmental deterioration rating, and accidental damage rating systems. The characteristic functions of these systems are analyzed in relation to the reliability of the inspection and the structural safety requirements. The fleet leader and rotational sampling methods for the damage inspection and the selection method of structurally significant items are described. S.H.

**A86-25850**

**AFFORDABLE SAFETY**

J. M. RAMSDEN Flight International (ISSN 0015-3710), vol. 129, Jan. 25, 1986, p. 41-43.

Inspection procedures which will improve aircraft maintenance by reducing human error factors are examined. Examples of aircraft accidents which have occurred due to improper maintenance are presented. The utilization of improved accident reporting technique, such as affordable reporting and the confidential incident reporting system, is studied. The development of an independent internal safety audit system which increase communications between pilots and engineers for all airlines is analyzed. I.F.

**A86-26072#**

**ADVANCES IN SIMULATION, CONTROL AND GUIDANCE AND OTHER SYSTEMS FOR MANNED AND UNMANNED AIRCRAFT**

H. N. KRISHNAMURTHY (Aeronautical Development Establishment, Bangalore, India) Defence Science Journal (ISSN 0011-748X), vol. 35, April 1985, p. 171-193. refs

Recent advances in the areas of flight simulation and unmanned flight vehicles at the Aeronautical Development Establishment at Bangalore, India, are presented. Particular attention is paid to aspects of flight modeling and validation, simulation hardware, control and guidance, displays, flight management of manned and unmanned aircraft, design of unmanned flight vehicles, and light-weight structures. Consideration is given to the built-in energy-absorption systems designed to protect the peripheral aircraft structures against bird impact damage, and to shield the structures of unmanned vehicles that are likely to suffer from ground impact during the recovery phase. Block diagrams are included. I.S.

**A86-26114**

**THE WORLD AIRCRAFT INDUSTRY**

D. TODD (Manitoba, University, Winnipeg, Canada) and J. SIMPSON London/Dover, MA, Croom Helm/Auburn House Publishing Co., 1986, 282 p. refs

A comprehensive survey of the current state of the world aircraft industry is presented. The development of the industry and its current problems are considered. The role of governments is examined, showing how this differs from country to country. The prospects for the future shape of the industry, as newly industrialized countries become involved, are assessed. C.D.

**A86-26274**

**PLASTIC MEDIA BLAST BEST FOR STRIPPING**

J. B. BULLINGTON (U.S. Army, Production Engineering Div., Corpus Christi, TX) ManTech Journal, vol. 10, no. 4, 1985, p. 48-55.

A new cost-effect technique for paint stripping, which complies with nonpollution and safety standards is examined. The plastic media blast (PMB) process of removing acrylic and lacquer topcoats from epoxy prime surfaces, which is applicable to airframes, tail rotors, and composites, is analyzed; the advantages of the PMB technique are discussed. The need to prevent media and dust contamination of specific aircraft components is investigated. The design of the standard cabinet-type continuous-flow dry air blasting machine used in the PMB process is described. I.F.

**N86-18284#** Joint Publications Research Service, Arlington, Va.
**USSR REPORT: TRANSPORTATION**
4 Dec. 1985 67 p Transl. into ENGLISH from various Russian articles
(JPRS-UTR-85-014) Avail: NTIS HC A04

USSR Reports - Transportation (JPRS-UTR-85-014), 4 Dec. 1985, contains reports on Civil Aviation, Motor Vehicles and Highways, Rail Systems, and Maritime and River Fleets. Of particular interest in this issue are articles on air traffic control radar problems, and the use of laser technology to resurface worn aircraft parts.

## 02

## AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

**A86-22730#**
**INVESTIGATION OF A TIP CLEARANCE CASCADE IN A WATER ANALOGY RING**
J. A. H. GRAHAM (Pratt and Whitney Canada, Longueuil) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 108, Jan. 1986, p. 38-46. refs
(ASME PAPER 85-IGT-65)

The tip clearance flow region of high-pressure axial turbine blades for small gas turbine engines has been investigated in a water flow cascade. The blade model features variable clearance and variable endwall speeds. The cascade is scaled for Reynolds number and sized to give velocities suitable for visualization. Pressure profiles were measured on one blade, and correlated with the visualization. Unloading is found to be a major feature of the pressure field at both tip and midspan, and is intimately connected with scraping effects and the behavior of the clearance vortex. Some initial hot-film velocity measurements are also presented. Author

**A86-22732*#** National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
**AERODYNAMIC DETUNING ANALYSIS OF AN UNSTALLED SUPERSONIC TURBOFAN CASCADE**
D. HOYNIAK (NASA, Lewis Research, Center, Cleveland, OH) and S. FLEETER (Purdue University, West Lafayette, IN) ASME, Transactions, Journal of Engineering for Gas Turbines and Power (ISSN 0022-0825), vol. 108, Jan. 1986, p. 60-67. Previously announced in STAR as N85-26670. refs
(ASME PAPER 85-GT-192)

An approach to passive flutter control is aerodynamic detuning, defined as designed pasage-to-passage differences in the unsteady aerodynamic flow field of a rotor blade row. Thus, aerodynamic detuning directly affects the fundamental driving mechanism for flutter. A model to demonstrate the enhanced supersonic aeroelastic stability associated with aerodynamic detuning is developed. The stability of an aerodynamicaly detuned cascade operating in a supersonic inlet flow field with a subsonic leading edge locus analyzed, with the aerodynamic detuning accomplished by means of nonuniform circumferential spacing of adjacent rotor blades. The unsteady aerodynamic forces and moments on the blading are defined in terms of influence coefficients in a manner that permits the stability of both a conventional uniformally spaced rotor configuration as well as the detuned nonuniform circumferentialy spaced rotor to be determined. With Verdon's uniformly spaced Cascade B as a baseline, this analysis is then utilized to demonstrate the potential enhanced aeroelastic stability associated with this particular type of aerodynamic detuning. Author

**A86-23126*#** Virginia Polytechnic Inst. and State Univ., Blacksburg.
**THE RESPONSE OF AIRFOILS TO PERIODIC DISTURBANCES - THE UNSTEADY KUTTA CONDITION**
D. R. POLING and D. P. TELIONIS (Virginia Polytechnic Institute and State University, Blacksburg) AIAA Journal (ISSN 0001-1452), vol. 24, Feb. 1986, p. 193-199. NASA-supported research. refs
(AIAA PAPER 84-0050)

Two cases of unsteady flowfields over a NACA 0012 airfoil at an angle of attack are examined. The first is the classical pitching motion about the airfoil's quarter chord. The second is the flow over a fixed airfoil immersed in the wake of the pitching airfoil. Large reduced frequencies are examined. Measurements were obtained in a water tunnel by laser Doppler velocimetry. Ensemble-averaged velocity measurements were obtained in the vicinity of the trailing edges of both the pitching and the fixed airfoil. The results indicate that the classical unsteady Kutta condition is clearly not valid. An extension of this condition earlier proposed by Giesing and Maskell is examined and some evidence is provided for its support. Author

**A86-23133#**
**NUMERICAL SIMULATION OF LEADING-EDGE VORTEX FLOWS**
D. P. RIZZETTA and J. S. SHANG (USAF, Wright Aeronautical Laboratories, Wright-Patterson AFB, OH) AIAA Journal (ISSN 0001-1452), vol. 24, Feb. 1986, p. 237-245. Previously cited in issue 17, p. 2424, Accession no. A84-37962. refs

**COMPRESSIBILITY CORRECTIONS FOR MULTIFOIL SECTIONS**
A. HARRIS (De Havilland Aircraft of Canada, Ltd., Toronto, Canada) Journal of Aircraft (ISSN 0021-8669), vol. 23, Feb. 1986, p. 156-158. Research supported by the Department of National Defence of Canada. refs

The Lieblein and Stockman (1972) method for obtaining the compressible flow within a duct, as modified by Dietrich et al (1983) to yield a compressible flow correction for external flow, is presently applied to the case of a 24 percent-thick augmentor wing multifoil section in cruise configuration. The agreement between theory and experiment thus obtained is especially good in the case of the main airfoil section, confirming the applicability of the external compressibility correction to very thick sections. O.C.

**AERODYNAMIC DESIGN OF AN AIRFOIL WITH ALLOWANCE FOR THE CONDITION OF NONSEPARATED FLOW [AERODINAMICHESKOE PROEKTIROVANIE PROFILIA S UCHETOM USLOVIIA BEZOTRYVNOSTI]**
Z. KH. NUGMANOV, V. A. OVCHINNIKOV, and V. G. PAVLOV Aviatsionnaia Tekhnika (ISSN 0579-2975), no. 3, 1985, p. 47-50. In Russian. refs

The paper is concerned with the problem of plotting the contour of an airfoil for a given surface pressure distribution using the theory of potential flow of an incompressible fluid. The airfoil coordinates are determined in the form of a series expansion in Jacobi polynomials whose coefficients are obtained from the flow line equation by the method of successive approximations. The law of pressure recovery beyond the maximum velocity point is expressed in the form of the Stratford analytical function, which ensures nonseparated flow in this region. Results of calculations are presented. V.L.

**NEW ASPECTS OF THE SMALL-PERTURBATION METHOD IN AERODYNAMICS [NOVE ASPEKTY METODY MALYCH PORUCH V AERODYNAMICE]**

Z. SKODA Zpravodaj VZLU (ISSN 0044-5355), no. 5, 1985, p. 325-328. In Czech. refs

Results obtained with a system for computing the aerodynamic derivatives of an entire aircraft by the method of discrete forces are summarized. The application of this method to nonstationary cases makes it possible to calculate generalized aerodynamic forces for the dynamic analysis of a flexible aircraft. The method of discrete forces is described with respect to the way in which it differs from the method of discrete vortices. B.J.

**PRACTICAL DIFFICULTIES IN THE THEORETICAL DESIGN OF LOW-SPEED PROFILES [PRAKTICKE OBTIZE PRI TEORETICKEM NAVRHU NIZKORYCHLOSTNICH PROFILU]**

P. BERAK Zpravodaj VZLU (ISSN 0044-5355), no. 5, 1985, p. 355-358. In Czech. refs

It is noted that results of programs for the design of low-speed profiles may be distorted by discretization deviations or by methodological simplifications. In an effort to overcome these difficulties, experience obtained with five programs is analyzed. It is concluded that high-quality profiles can be designed quickly when velocity distributions from proven profiles are applied. B.J.

**THE DEVELOPMENT OF A SECOND-GENERATION OF CONTROLLED DIFFUSION AIRFOILS FOR MULTISTAGE COMPRESSORS**

R. F. BEHLKE (United Technologies Corp., Pratt and Whitney Div., East Hartford, CT) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 11 p. refs
(ASME PAPER 85-IGT-9)

The evolution of Controlled Diffusion Airfoils is traced from inception of the theoretical design model to demonstration of significant performance gains at engine operating conditions in a multistage compressor rig. The proven aerodynamic benefits and versatility of first-generation Controlled Diffusion Airfoil blade elements are extended to the endwall flow region using an Integrated Core/Endwall Vortex design model to produce a new full span optimized second-generation Controlled Diffusion design. Highlighted are the essential roles of extensive cascade, low speed, large scale and high Mach number compressor rig testing in developing and substantiating the second generation Controlled Diffusion technology resulting in a 1.5 percent increase in efficiency and 30 percent increase in surge-free operation relative to first-generation Controlled Diffusion Airfoils. Author

**AERODYNAMIC RESEARCH ON STRAIGHT WALL ANNULAR DIFFUSER FOR TURBOFAN AUGMENTOR**

Q. M. XIE and J. G. GU (China Gas Turbine Establishment, Jiangyou, People's Republic of China) ASME, Chinese Society of Aeronautics and Astronautics, and China National Aero-Technology Import and Export Corp., Beijing International Gas Turbine Symposium and Exposition, Beijing, People's Republic of China, Sept. 1-7, 1985. 7 p. refs
(ASME PAPER 85-IGT-16)

The effect of nonuniform inlet velocity and temperature profile on the aerodynamic performance of a straight wall annular diffuser for a turbofan augmentor has been investigated. The distribution of static pressure, stagnation pressure and temperature has been measured, thus pressure recovery coefficient, velocity profile and temperature profile at different axial station along the diffuser center line can be determined. The experimental results showed that the momentum ratio of two streams across the diffuser inlet flow splitter is the nondimensional flow parameter controlling diffuser aerodynamic performance. Thus, it is possible to simulate turbofan augmentor annular diffuser performance by using a low temperature air flow aerodynamic test under the condition that the diffusers are of similar geometry, have the same inlet velocity profile, and maintain the momentum ratio constant. A correlation for the velocity distribution in the diffuser was also obtained. Author

**AERODYNAMICS OF SWEPT WINGS WITH MEDIUM AND SMALL ASPECT RATIOS. II [AERODINAMIKA STRELOVIDNYKH KRYL'EV SREDNIKH I MALYKH UDLINENII. II]**

V. V. STRUMINSKII Moscow, AN SSSR, Sektor Mekhaniki Neodnorodnykh Sred, 1983, 63 p. In Russian.

Test results for sweptback (35, 45, and 60 deg) and sweptforward (-30 deg) wings with various aspect ratios are reported, and the characteristic features of flow past these wings are examined. In particular, an analysis is made of the effect of the sweep angle on the aerodynamic characteristics of aircraft over the full range of angles of attack. Solutions are obtained which make it possible to take advantage of the effect of slip in the wing cross-sections and improve the performance characteristics of swept wings. V.L.

**HEAT TRANSFER PROBLEMS IN AERO-ENGINES**

D. K. HENNECKE (MTU Motoren- und Turbinen-Union Muenchen GmbH, Munich, West Germany) IN: Heat and mass transfer in rotating machinery . Washington, DC, Hemisphere Publishing Corp., 1984, p. 353-379. refs

A survey of the heat transfer problems to be solved when developing an aircraft gas turbine engine is presented looking at each engine component separately. It is shown that the responsibilities of the heat transfer engineer have greatly increased. In addition to the design of the cooling system of the 'hot parts', such as the combustor and turbine, these include the evaluation and assessment of the thermal behavior of nearly all other parts such as the fan, compressor, labyrinth seals, bearings, etc. This is the result of the trend in aero-engines toward higher cycle pressures and temperatures, increased reliability with reduced engine weight, and ever tighter clearances to improve performance and, thus, achieve a further reduction in fuel consumption. It is shown that many heat transfer phenomena in aero-engines are not yet understood well enough. Therefore, heat transfer areas that need continued or intensified research are highlighted, demonstrating that many challenging problems remain to be tackled. Author

**POST STALL STUDIES OF UNTWISTED VARYING ASPECT RATIO BLADES WITH NACA 44XX SERIES. II - AIRFOIL SECTIONS**

C. OSTOWARI (Texas A & M University, College Station) and D. NAIK Wind Engineering (ISSN 0309-524X), vol. 9, no. 3, 1985, p. 149-164. refs

The present study is concerned with the poststall aerodynamic characteristics, lift, drag, and pitching moment, of untwisted constant chord blades as a function of airfoil thickness, aspect ratio, and Reynolds number. It is pointed out that these data are helpful for the design of cost-effective wind energy conversion devices. The conducted investigation of three-dimensional, cambered blades made use of the NACA 44XX series of airfoil sections. The presented results have been carefully selected with the objective to give the reader a fair representation of the aerodynamic ramifications of operating in deep stall conditions. G.R.

**STUDIES OF THE AERODYNAMICS OF FLAPS AND SPOILERS IN UNSTEADY FLOW [ETUDES AERODYNAMIQUES DES VOLETS ET SPOILERS EN INSTATIONNAIRE]**

M. COSTES and M. RAHAINGOMANANA (ONERA, Chatillon-sous-Bagneux, France) ONERA, TP, no. 1985-149, 1985, 24 p. In French. refs
(ONERA, TP NO. 1985-149)

The experimental and theoretical research on control surfaces and control laws carried out by ONERA over the last decade are summarized. A prime goal of the program is to develop control laws with short response times for conditions such as unstable flight. Models for sinusoidal motions, the accompanying pressure response and the coefficient of pressure are presented, with quasi-steady values being derived from unsteady values that have a frequency which approaches zero. Trials at the Modane wind tunnel have included spoilers placed at various locations of the chord line and studied in two- and three-dimensional flows. Variations were introduced into the flow Mach number, the Re and the steady and unsteady flow parameters in developing the control laws. Steady-unsteady interactions with a trailing edge flap were found to have significant effects. The placement of a spoiler affected the appearance and magnitude of unsteady flow on a wing, causing oscillations which exceeded those of flaps on the trailing edge. Motions of either of the two types of the control surfaces produced unsteady flow and affected the efficiency of the wing used, a RA16SC1 profile. M.S.K.

**A VISCOUS-INVISCID INTERACTION MODEL FOR TRANSONIC UNSTEADY FLOW [METHODE D'INTERACTION VISQUEUX-NONVISQUEUX POUR LE CALCUL DE DECOLLEMENT INSTATIONNAIRE TRANSSONIQUE]**

J. L. LE BALLEUR and P. GIRODROUX-LAVIGNE ONERA, TP, no. 1985-152, 1985, 35 p. In French. refs
(ONERA, TP NO. 1985-152)

A numerical method is presented for describing flows with viscous-inviscid interactions with or without separation and illustrated by examples. The model includes a two-equation model for turbulence solved by implicitly with a space-marching technique in both direct and inverse modes. A semi-implicit coupling method which features relaxation of the unsteady effects at the viscous boundary is made to converge at each time step and recapture the downstream viscous effects. The grid used is adaptable to the scale of the phenomena being studied and is also useful for modeling problems involving separation and shock-boundary layer interactions. Results are presented for sample calculations for steady and unsteady separated flows around NLR7301 and NACA64A010 airfoils. The influence of frequency is discussed, along with the effects of shock-induced separation. The model is capable of predicting the magnitude of buffeting which can be expected in transonic flows. M.S.K.

**SOLUTION OF THE NAVIER-STOKES EQUATIONS IN A COMPRESSIBLE FLUID BY AN IMPLICIT METHOD [RESOLUTION DES EQUATIONS DE NAVIER-STOKES EN FLUIDE COMPRESSIBLE PAR UNE METHODE IMPLICITE]**

H. HOLLANDERS (ONERA, Chatillon-sous-Bagneux, France) and W. RAVALASON (Aerospatiale, Division Engins Tactiques, Paris, France) ONERA, TP, no. 1985-148, 1985, 43 p. In French. refs
(ONERA, TP NO. 1985-148)

An implicit finite-volume method which is second-order accurate, highly stable, and dissipative in weakly viscous regions, is presented for solving the time-dependent Navier-Stokes equations in integral form, and is applied to steady subsonic and transonic flow calculations over a NACA0012 airfoil in the laminar case, and over an ogive-cylinder projectile in the turbulent axisymmetric case. For turbulent flows, the mass-averaged Navier-Stokes equations are solved using a mixing-length eddy viscosity model. The results presented emphasize the good properties of stability and fast convergence of the method. Author

### RECENT ADVANCES IN HELICOPTER AERODYNAMICS

J. J. PHILIPPE (ONERA, Chatillon-sous-Bagneux, France), P. ROESCH, A. M. DEQUIN, and A. CLER (Aerospatiale, Paris, France) ONERA, TP, no. 1985-166, 1985, 36 p. refs
(ONERA, TP NO. 1985-166)

The aerodynamics of isolated helicopter rotors and fuselages is addressed, and a few topics in interactional aerodynamics are also considered. Computational approaches to main rotor aerodynamics are examined, including simple blade element theory, prescribed wake models, distorted wake models, free wake models, and problems related to dynamic stall on the retreating blade, unsteady transonic flow on the advancing blade, blade deformations, and the rotor in hover flight. Experimental methods in wind tunnels to measure local and global performance as well as blade pressure are considered. Aspects of rotor design, including airfoil selection, blade twist, and blade planform are discussed. Experimental methods in fuselage aerodynamics are addressed considering problems in wind tunnel testing and examining fuselage drag and interactions in detail. The principal theoretical methods in fuselage aerodynamics are examined, including potential calculations, separated flow models, streamline boundary layer calculations, and wake calculations. C.D.

### STATOR ROW UNSTEADY AERODYNAMICS DUE TO WAKE EXCITATIONS

S. FLEETER and V. CAPECE (Purdue University, West Lafayette, IN) IN: Unsteady aerodynamics of turbomachines and propellers; Proceedings of the Symposium, Cambridge, England, September 24-27, 1984 . Cambridge, Cambridge University, 1984, p. 427-446. USAF-supported research. refs

The fundamental unsteady aerodynamics on a vane row of an axial flow research compressor stage are experimentally investigated, demonstrating the effects of airfoil camber and steady loading. In particular, the rotor wake generated unsteady surface pressure distributions on the first stage vane row are quantified over a range of operating conditions. These cambered airfoil unsteady data are correlated with predictions from a flat plate cascade inviscid flow model which considers both nonseparated and suction surface flow separation. At the design point, the unsteady pressure difference coefficient data exhibit excellent correlation with the nonseparated predictions, with the aerodynamic phase lag data exhibiting good trendwise correlation. The quantitative phase lag differences are associated with the camber of the airfoil. An aft suction surface flow separation region is indicated by the steady state surface static pressure data as the aerodynamic loading is increased. This separation affects the increased incidence angle unsteady pressure data, with these data correlating with the aft suction surface separated flow predictions. Author

### COMPARATIVE MEASUREMENTS OF THE UNSTEADY PRESSURES AND THE TIP-VORTEX PARAMETERS ON FOUR OSCILLATING WING TIP MODELS

W. J. WAGNER (DFVLR, Institut fuer Aeroelastik, Goettingen, West Germany) IN: Unsteady aerodynamics of turbomachines and propellers; Proceedings of the Symposium, Cambridge, England, September 24-27, 1984 . Cambridge, Cambridge University, 1984, p. 513-531. refs

Experimental investigations on steady and unsteady pressure distributions and on the tip vortex qualities of four wing tip configurations (rectangular tip, ogee tip, trapezoidal tip, swept tip) are presented and discussed. The analyses of the results show some unexpected phenomena such as double vortex structures and changing vortex structures during blade oscillation. The tip vortex qualities were investigated by means of an ultrasonic measuring device. The results give insight into the finer structure of the vortices and supply information on vortex position, core diameter and maximum velocity as well as vortex behavior if the blade is oscillated. All four configurations show a concave curvature of the lines of equal pressure on the region where the tip vortex originates. This is a sign of underpressure fields induced there. Author

### AERODYNAMIC PERFORMANCE OF TWO FIFTEEN-PERCENT-SCALE WIND-TUNNEL DRIVE FAN DESIGNS

D. B. SIGNOR (NASA, Ames Research Center, Moffett Field, CA) and H. V. BORST (Borst and Associates, Wayne, PA) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 21-35. refs
(AIAA PAPER 86-0734)

An experimental and analytical investigation of two fan blade designs was conducted. The fan blades tested were 15 percent scale models of the blades used in the National Full Scale Aerodynamic Complex fan drive at NASA Ames Research Center. The fan blades were composed of NACA-65 and modified NACA-65-series airfoil design sections. The blades with modified 65-series sections incorporated increased thickness on the upper surface, between the leading edge and the one-half chord position. Twist and taper were the same for both blade designs. The fan blades with modified 65-series sections were found to have an increase in stall margin when they were compared with the unmodified blades. The experimental performance data agreed favorably with theoretical calculations. Author

### AN ESTIMATION [illegible] WALL INTERFERENCE ON A TWO-DIMENSIONAL CIRCULATION CONTROL AIRFOIL

N. J. WOOD (Stanford University, CA) and E. O. ROGERS (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 57-63. refs
(AIAA PAPER 86-0738)

Tests in two different wind tunnels of the same series of circulation control airfoils has provided insight into the nature of tunnel wall interference on the data obtained from high lift airfoils. In particular, strong influence of the chord-to-height ratio is shown - in this case a 12 percent difference in the apparent (uncorrected) sensitivity of lift to jet momentum level. These performance changes are found to arise from differences in effective incidence and a correlation with existing interference theory is established. Substantiation of a simple technique (inviscid pressure distribution matching) for identifying the effective angle of attack directly from airfoil data is obtained by demonstrating a collapse of data from the two wind tunnels. As an important contribution to the aerodynamics of circulation control airfoils, the correction of the angle of attack to free air conditions has indicated that the mid-chord pitching moment is essentially decoupled from the blowing momentum. Author

### AN EXPERIMENTAL STUDY OF A HIGH PERFORMANCE CANARD AIRFOIL WITH BOUNDARY LAYER TRIP AND VORTEX GENERATORS

M. G. BRAGG and G. M. GREGOREK (Ohio State University, Columbus) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 361-368.
(AIAA PAPER 86-0781)

The canard airfoil from the Voyager aircraft was tested in The Ohio State University's Subsonic Wind Tunnel. This highly optimized

laminar flow section has good clean airfoil performance but suffers severe lift and drag penalties with early boundary layer transition. These performance penalties result from a midchord boundary layer separation. An experimental program was conducted to document this problem and then to design and test vortex generators to improve the tripped airfoil performance while having the least affect on the clean airfoil. A set of properly designed vortex generators are shown along with the aerodynamic results to document their performance. A brief study of the effect of surface roughness in the turbulent boundary layer is also discussed.

### THE LAMINAR WING - A WAY FOR IMPROVING THE ECONOMY OF COMMERCIAL AIRCRAFT [DER LAMINARFLUEGEL - EIN WEG ZUR VERBESSERUNG DER WIRTSCHAFTLICHKEIT VON VERKEHRSFLUGZEUGEN]

K.-H. HORSTMANN, H. KOESTER, G. REDEKER, and A. QUAST (DFVLR, Institut fuer Entwurfs-Aerodynamik, Brunswick, West Germany) DFVLR-Nachrichten (ISSN 0011-4901), Nov. 1985, p. 51-55. In German.

In the context of efforts to improve the economy of aircraft operations, new commercial aircraft with considerably reduced fuel consumption are being developed. Aerodynamics makes an important contribution to these efforts by providing new technologies which are capable to reduce drag. The national research program the 'Laminar Wing' is to establish the foundations for the use of a laminar wing with low drag characteristics in larger aircraft. The DFVLR is the initiator and an important partner in this program. It is pointed out that low-drag laminar wings are already employed in gliders for several decades. The technology of the laminar wing is discussed along with basic information regarding the determination of the laminar-turbulent transition, the design of laminar profiles for commercial aircraft, the economics of an operation of commercial aircraft with laminar wings, and problems arising in the case of a commercial aircraft with laminar wings. It is concluded that savings in fuel of approximately 30 percent in comparison to conventional aircraft are possible. G.R.

### ENERGETICS AND OPTIMUM MOTION OF OSCILLATING LIFTING SURFACES OF FINITE SPAN

A. R. AHMADI and S. E. WIDNALL (MIT, Cambridge, MA) Journal of Fluid Mechanics (ISSN 0022-1120), vol. 162, Jan. 1986, p. 261-282. Research supported by Bolt Beranek and Newman, Inc. refs
(Contract NGR-22-009-818)

In certain modes of animal propulsion in nature, such as bird flight and fish swimming, the efficiency compared to man-made vehicles is very high. In such cases, wing and tail motions are typically associated with relatively high Reynolds numbers, where viscous effects are confined to a thin boundary layer at the surface and a thin trailing wake. The propulsive forces, which are generated primarily by the inertial forces, can be calculated from potential-flow theory using linearized unsteady-wing theory (for small-amplitude oscillations). In the present study, a recently developed linearized, low-frequency, unsteady lifting-line theory is employed to calculate the (sectional and total) energetic quantities and optimum motion of an oscillating wing of finite span.

### DOUBLET STRIP METHOD FOR OSCILLATING RECTANGULAR WINGS IN SUBSONIC FLOW

A. ICHIKAWA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 374, 1985, p. 152-159. In Japanese, with abstract in English. refs

An improved numerical method is presented for calculating the load distribution on oscillating rectangular wings in subsonic flow. The wing is divided into many chordwise strips. In the strips containing the control point, the kernel function is treated in the form of an expansion series, and spanwise integration is performed to obtain a chordwise logarithmic singularity. Through accurate evaluation of the singularity, the present method gives quick convergence and excellent computational efficiency to other current methods.

### IMPROVED DOUBLET LATTICE METHOD FOR OSCILLATING SWEPT TAPERED WINGS IN INCOMPRESSIBLE FLOW

A. ICHIKAWA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 376, 1985, p. 296-303. In Japanese, with abstract in English. refs

An improved doublet lattice method is presented for calculating the load distributions on oscillating swept tapered wings in incompressible flow. The integration domain is transformed into a rectangular one, and the wing is divided into many chordwise strips. In the strip containing control points, Cauchy singularity and logarithmic singularity are properly accounted for. The solutions generally compare well with other lifting surface theories, but with much smaller computational times, and the method is found to be more accurate and to converge faster than conventional doublet lattice methods.

**AERODYNAMIC PERFORMANCES OF FABRIC SURFACE AIRFOILS**

M. KOBAYAKAWA and Y. KONDO Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 379, 1985, p. 491-494. In Japanese, with abstract in English. refs

Aerodynamic performances are measured for airfoils and circular cylinders with fabric surface. Generally, the critical Reynolds number for the drag of circular cylinder depends on the surface roughness. The measured results of the cylinders with fabric surface agree with Achenbach's results of sand roughness. The lift to drag ratios of the airfoil (NACA-0012) are much affected by fabric roughness. The differences of the lift to drag ratio between the different roughness are largest near their maximum values and decrease as the angle of attack increases. After the stall, no differences appear. The lift to drag ratio is also affected by the directions of stich. The lift to drag ratio decreases abruptly as k, the parameter of fabric roughness, increases to 0.2, but over this value its tendency becomes milder. Author

**ON HYPERSONIC FLOW AROUND WINGED-VEHICLES AT HIGH ANGLES OF ATTACK**

M. YASUHARA, K. TSUBOI, N. FUKUDA, and K. SAKURAI Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 380, 1985, p. 516-524. In Japanese, with abstract in English. refs

Experiments on hypersonic flow around a caret wing and a winged vehicle were conducted in a shock tunnel with a conical nozzle, at a Mach number of 8. Three force components and surface pressures were measured for a wide range of attack angle up to 45 deg, and compared with Newtonian flow theory, giving good comparisons for the nearly flat-bottomed models, except pitching moments. The source flow produced by the conical nozzle affects measured pressures and forces, and some corrections are necessary. Author

**A STUDY ON THE PROPULSIVE FORCE OF WINGS IN NON-STEADY MOTION BY THE THEOREM OF MOMENTUM**

T. ICHIKAWA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 381, 1985, p. 575-583. In Japanese, with abstract in English. refs

Propulsive force is considered of a two-dimensional airfoil executing a nonsteady out-of-plane motion from a standpoint of the theorem of momentum in the framework of the linear theory. By regarding the system of the airfoil and wake as a superposition of vortex pairs, it is shown that, for a harmonically oscillating airfoil, an appropriate form of the wake vortex sheet to give the correct propulsion is one that is determined under the influence of the upwash of the airfoil only. Concering the time mean of the propulsion of the oscillating airfoil, this approach is shown to be equivalent to the method for calculating the drag force of a cylindrical body using the Karaman vortex street. **TWO-DIMENSIONAL SCHEME 'DLM-C' TO EXAMINE SUBSONIC UNSTEADY LIFTING SURFACE SCHEMES FOR FINITE SPAN**

S. ANDO, M. KATO, and A. ICHIKAWA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 382, 1985, p. 635-640. In Japanese, with abstract in English. refs

In order to investigate accuracy and convergence characteristics of any unsteady lifting surface computation programs, it is found that the 'DLM-C' scheme for two-dimensional airfoils is quite useful. This scheme is reliable up to high reduced frequencies k and high subsonic free stream Mach numbers M. It has comparable efficiency with NASA 2-D, within published k and M values. For a rectangular wing of aspect ratio ten, chordwise lift distributions on the midspan section are computed by using some unsteady lifting surface programs, which are compared with DLM-C. The values of error-index parameters E are entered in a k vs M diagram, and constant E curves are drawn. This diagram shows clearly the upper limit of k where the scheme is efficient. Author

**AERODYNAMIC CHARACTERISTICS OF SLENDER WING-GAP-BODY COMBINATIONS. II**

Y. YAMAMOTO and S. ANDO Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 382, 1985, p. 641-648. In Japanese, with abstract in English. refs

Aerodynamic characteristics of slender wing-gap-body combinations are studied exactly in the framework of slender-body theory. In a previous paper, the solutions of total lift curve slope were obtained, in which the wings and the body have different incidence with respect to the free stream, and arbitrary width of chordwise gaps exist between the wings and body. In this work, the induced drag as well as the lift is evaluated exactly. This requires that the lift due to the wings and the lift due to the body are separately known. Many problems in which missile aerodynamicists have interest may be covered. Author

**AERODYNAMICS OF LIFTING SURFACES IN STEADY FLOW [AERODINAMIKA NESUSHCHIKH POVERKHNOSTEI V USTANOVIVSHEMSIA POTOKE]**

N. F. VOROBEV Novosibirsk, Izdatel'stvo Nauka, 1985, 240 p. In Russian. refs

Problems concerning subsonic and supersonic flow past surfaces are reduced to solving integral equations, and examples of exact solutions are presented. Green functions are determined for the wave equation for prismatic regions, which makes it possible to obtain solutions to problems of supersonic flow past complex configurations with allowance for reflection and diffraction phenomena. Approximations of solutions to integral equations are discussed; the convergence behavior of the discrete vortex method is analyzed. V.L.

**TEST CASES FOR THE PLANE POTENTIAL FLOW PAST MULTI-ELEMENT AEROFOILS**

A. SUDDHOO and I. M. HALL (Manchester, Victoria University, England) Aeronautical Journal (ISSN 0001-9240), vol. 89, Dec. 1985, p. 403-414.

The method of images is used to calculate the analytical solution for an inviscid incompressible flow past four arbitrary circles which are then conformally mapped onto aerofoil sections. The analytical solution of the corresponding flow past the system of aerofoils is obtained and the pressure distributions about a particular three-element and a particular four-element aerofoil are presented. These results are intended to be used to assess the accuracy of numerical methods. Author

**AN EXPERIMENTAL INVESTIGATION OF THE PARALLEL BLADE-VORTEX INTERACTION**

F. X. CARADONNA, G. H. LAUB, and C. TUNG (NASA, Ames Research Center; U.S. Army, Aeromechanics Laboratory, Moffett Field, CA) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 29 p. Previously announced in STAR as N85-13777. refs

A scheme for investigating the parallel blade vortex interaction (BVI) has been designed and tested. The scheme involves setting a vortex generator upstream of a nonlifting rotor so that the vortex interacts with the blade at the forward azimuth. The method has revealed two propagation mechanisms: a type C shock propagation from the leading edge induced by the vortex at high tip speeds, and a rapid but continuous pressure pulse associated with the proximity of the vortex to the leading edge. The latter is thought to be the more important source. The effects of Mach number and vortex proximity are discussed. Author

**A CONSISTENT MATHEMATICAL MODEL TO SIMULATE STEADY AND UNSTEADY ROTOR-BLADE AERODYNAMICS**

U. LEISS (Muenchen, Universitaet der Bundeswehr, Munich, West Germany) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 16 p. refs

A general formulation has been developed to simulate the stalled and unstalled aerodynamic coefficients of a rotor blade in steady and unsteady flow. The main features of the present method are few empirical parameters with physical background in the full range in angle of attack and Mach number without the need to sectionize the validity of parameters. The method takes account for different types of steady stall and the influence of Reynolds number. Unsteady effects due to pitch, plunge and fore and aft motion are separately implemented. The calculated steady normal force coefficient curve and the unsteady hysteresis loops of the present method match very well with the two-dimensional test data, even for high frequencies. In addition some comparisons with other methods are presented. Aerodynamic rotor forces can be obtained by analytical integration of the section forces over the span of the blade and analytical derivatives of these forces are possible. Author

**COMPARATIVE MEASUREMENTS OF THE UNSTEADY PRESSURES AND THE TIP-VORTEX PARAMETERS OF FOUR OSCILLATING WING TIP MODELS**

W. J. WAGNER (DFVLR, Institut fuer Aeroelastik, Goettingen, West Germany) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 18 p. refs

Experimental investigations on steady and unsteady pressure distributions and on the tip vortex qualities of four wing tip configurations (rectangular tip, Ogee tip, trapezoidal tip, swept tip) are presented and discussed. The tip vortex qualities were investigated by means of an ultrasonic measuring device. The results give insight into the finer structure of the vortices and supply information on vortex position, core diameter and maximum velocity as well as vortex behavior if the blade is oscillated. This is demonstrated by a selection of a few single conditions. Author

**THEORETICAL PREDICTION OF RUNNING-TIME MEASUREMENTS IN UNSTEADY FLOW**

W. SEND (DFVLR, Institut fuer Aeroelastik, Goettingen, West Germany) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 17 p. refs

The results obtained for the present theoretical predictions of running time measurements, in the context of an investigation of various rotor blade tip clearances, are aimed at a deeper understanding of vorticity formation and concentration in the wake of a blade. The physical assumptions for the flow are infinitely high Reynolds number and incompressible flow, which lead to a simplified vorticity transport equation. Attention is given to the analytical solution of the three-dimensional wake integral in unsteady flow, which permits fast and precise computation of induced velocity fields. Theoretical and experimental results are compared for two different profiles in the cases of reduced frequency, amplitude, and steady angle-of-incidence. O.C.

**SUBSONIC WALL INTERFERENCE CORRECTIONS FOR HALF-MODEL TESTS USING SPARSE WALL PRESSURE DATA**

M. MOKRY Nov. 1985 35 p refs Presented at the Euromech Colloquium No. 187 on Adaptive Wall Wind Tunnels and Wall Interference Correction Methods, Goettingen, West Germany, 15-17 Oct. 1984
(LR-616; NRC-25132) Avail: NTIS HC A03/MF A01

A method is described for correcting subsonic wind tunnel measurements on half-models in ventilated test sections, operated at subcritical flow conditions at the walls. For perforated walls, the boundary values of the streamwise component of the wall interference velocity are obtained from static pressures measured by a few longitudinal pressure tubes or rails attached to the walls and from the estimated farfield of the model in free air. The sparse boundary data is extended by means of streamwise smoothing and transverse interpolation. The streamwise velocity correction is derived from the doublet panel solution of an interior Dirichlet problem and the transverse corrections by integrating the irrotational flow conditions. The evaluated corrections to Mach number and angle of attack, presented as contour plots in the wing plane, provide insight into the correctability of the test results. Examples are given for a transport aircraft half-model tested in the NAE high speed wind tunnel. Applicability of the method at supercritical flow conditions at the model is examined on experimental and computational data of a high aspect ratio wing. Author

**COMPRESSIBLE, UNSTEADY LIFTING-SURFACE THEORY FOR A HELICOPTER ROTOR IN FORWARD FLIGHT**

H. L. RUNYAN and H. TAI Dec. 1985 21 p refs
(NASA-TP-2503; L-15976; NAS 1.60:2503) Avail: NTIS HC A02/MF A01 CSCL 01A

A lifting-surface theory has been developed for a helicopter rotor in forward flight for compressible and incompressible flow. The method utilizes the concept of the linearized acceleration potential and makes use of the doublet lattice procedure. Calculations demonstrating the application of the method are given in terms of the lift distribution on a one-bladed rotor, a two-bladed rotor, and a rotor with swept-forward and swept-back tips. Also, the lift on a rotor vibrating in a pitching mode at 4 per revolution is given. Compressibility effects and interference effects for a two-bladed rotor are discussed. Author

**CALCULATION OF HELICOPTER AIRFOIL CHARACTERISTICS FOR HIGH TIP-SPEED APPLICATIONS**

W. J. MCCROSKEY, J. D. BAEDER, and J. O. BRIDGEMAN 17 May 1985 16 p Presented at the 41st Annual Forum for the American Helicopter Society, Fort Worth, Tex., 15-17 May 1985
(AD-A160694) Avail: NTIS HC A02/MF A01 CSCL 20D

In this paper, we have applied a new aerodynamic tool to the study of helicopter airfoil characteristics. We have shown that the computed airloads reproduce completely the experimental behavior of representative airfoils across the transonic regime. In addition, the computational details of the flow fields, the surface pressure distributions, and the viscous-layer characteristics enable us to trace the evolution of the physical changes that occur as m infinity or Re increases. Descriptions of the complicated development of shock waves, shock-induced separation supplement the information that has been obtained heretofore in wind tunnels. In validating our calculations and assessing the accuracy of the results, including extensive grid-refinement studies and comparisons with data from numerous wind tunnels, we have defined more precisely the capabilities and limitations of the code ARC2D. This important aspect of the investigations can complement wind-tunnel tests, by providing flow-field details that are difficult to measure and by extending the range of flow parameters beyond the capabilities of existing wind tunnels. The code has now progressed from a purely research stage to almost a production stage, where it can be run by specialists in the helicopter industry. GRA

**CALCULATION OF THE EXTERNAL NACELLE SURFACE FOR SINGLE AND DOUBLE STREAM JET ENGINES FOR CIVIL AIRCRAFT [DE BEREKENING VAN HET OMSPOELD GONDELOPPERVLAK VAN ENKEL- EN DUBBELSTROOM STRAALMOTOREN VOOR CIVIELE VLIEGTUIGEN]**

E. TORENBEEK and G. H. BERENSCHOT Jan. 1983 40 p refs In DUTCH
(VTH-M-445) Avail: NTIS HC A03/MF A01

Simple formulas to be used in the conceptual design phase of civil aircraft for the calculation of principal dimensions and external surface of nacelles for single and double stream engines with turbocompressors are derived and verified. Nacelle surfaces of 35 engines, used in existing or planned aircraft, are determined to verify the formulas. Missing essential dimensions, such as inlet diameter and nacelle length, are referred to performance magnitudes such as bypass ratio and propulsion. Introducing (semi-) static relations, formulas whose applicability depends on available data are derived. An accuracy of 6.5% is reached; the most simple formula has a standard deviation of 12%. **ON THE LONGEST CHORD OF THE FIRST MULLER PROFILE [OVER DE LANGSTE KOORDE VAN HET EERSTE PROFIEL VAN MUELLER]**

J. J. H. BLOM Oct. 1983 20 p refs In DUTCH
(VTH-M-486) Avail: NTIS HC A02/MF A01

Using literature data, the coordinates, front point, and longest chord, defined as the largest distance between the sharp profile back edge and a point of the profile contour (= the front point) of the Muller wing profile were determined. A simpler transformation function for profile parameters, such as tail angle, curvature, and thickness, used in a Timman based iterative airfoil transformation program, is provided by Muller. Before profile forms can be compared with each other, a normalization on the longest chord is required. The tangent to the contour in the front point is at right angle to the longest chord. For so-called classical profile families, relations indicating exactly the front point can be derived. Author (ESA)

**PARAMETRIC DETERMINATION OF LIFT INTERFERENCE FOR THREE-DIMENSIONAL MODELS IN THE EMMEN (SWITZERLAND) AIRCRAFT WORKS WIND TUNNEL**

G. CAPITAINE 31 Aug. 1984 35 p refs In GERMAN; ENGLISH summary
(F+W-FO-1740) Avail: NTIS HC A03/MF A01

Wind tunnel wall interference effects on the flow around a model were investigated for correction of the test values. A FORTRAN 77 program is developed for determination of the lift interference correction with specific slit parameters and porosity parameters for a three-dimensional compressible flow in a rectangular test section with slotted top and botton walls and closed vertical walls. The numerical procedure is applied to entire configurations and semiconfigurations. The results are plotted on charts to determine the variations of the lift correction and streamline curvature factors for different slit parameters. Author (ESA)

**AN EXPERIMENTAL INVESTIGATION OF PROPELLER WAKES USING A LASER DOPPLER VELOCIMETER Ph.D. Thesis**

R. M. SUNDAR 1985 196 p
Avail: Univ. Microfilms Order No. DA8520081

This report presents a detailed investigation of the performance and flowfield of three single rotation propellers. These propellers were designed to demonstrate the efficiency improvements attainable by using proplets and biblades. Direct measurement of thrust by a parallelogram balance and power by measuring the input to the propulsion unit (dc motor) was used to determine the efficiency of the propellers. The force measurements demonstrated that the use of proplets did produce an efficiency improvement under high loading conditions in static operation as well as with forward speed. The improvement in static thrust by using proplets was comparable with that of a shrouded propeller. The flow field in the wake of the propellers was investigated with an LDV system. The measured velocity field is compared with the theoretical velocity field. Biot-Savarts' law was applied to the theoretically assumed vortex geometry in the wake to determine the theoretical velocity field. Dissert. Abstr.

**AERODYNAMIC TRANSFER FUNCTIONS FOR A FINITE WING IN INCOMPRESSIBLE FLOW**
H. MATSUSHITA 1985 58 p refs In JAPANESE; ENGLISH summary
(NAL-TR-867; ISSN-0389-4010) Avail: NTIS HC A04/MF A01

The aerodynamic transfer functions for a wing with a control surface in an incompressible flow are presented analytically using Laplace transform technique. The aerodynamic transfer function for an airfoil can be analytically represented with the generalized Theodorsen function as circulatory parts and the rational function as noncirculatory parts. The aerodynamic transfer function for a finite wing is obtained in a closed form which includes the nonrational function called a modified circulation. A modified circulation function shows a finite wing effect and is governed by an integro-differential equation, which can be solved efficiently by numerical computation. These results extend the simple harmonic theory to a general transient motion. With the expression thus obtained, the characteristics of the aerodynamic transfer function for a finite wing clearly show that it should have a branch point at the origin and have no singularities along the negative real axis. Transient aerodynamic forces in time domain such as an indicial lifts are obtained by inverse Laplace transforming the present results. Comparison of these results with the other methods and the experimental values shows a good agreement. Author

**LOW-SPEED WIND-TUNNEL INVESTIGATION OF THE EFFECT OF STRAKES AND NOSE MACHINES ON LATERAL-DIRECTIONAL STABILITY OF A FIGHTER CONFIGURATION**
J. M. BRANDON Washington Feb. 1986 33 p refs
(NASA-TM-87641; L-16051; NAS 1.15:87641) Avail: NTIS HC A03/MF A01 CSCL 01A

A series of low-speed static wind-tunnel force tests were conducted on a 0.15-scale model of a modern high-performance fighter aircraft. The tests identified the use of nose chines to enhance stability at high angles of attack. Results of this investigation showed that the strake was the major contributor to directional instability. The destabilizing forces were created by two mechanisms: (1) adverse flow in the region of the vertical tail, and (2) forces generated on the fuselage ahead of the center of gravity. Properly designed nose chines effectively negated the adverse flow near the vertical tail and created stabilizing forces on the forebody in the range of the stall angle of attack. Author

(AD-A161117; NSWC/TR-84-484) Avail: NTIS HC A13/MF A01 CSCL 20D

This report describes a fast method to provide a three dimensional starting flowfield to be used in a space-marching-type calculation for the afterbody flowfield of spherically capped missiles at incidence in supersonic flight speed. Utilizing the property of spherical symmetry of the flowfield about a sphere, three dimensional starting plane flowfield may be interpolated from the results of an axisymmetric flowfield about a sphere, which is available from an existing computer program (NOSTIP) with considerably less computing time. The analysis of the interpolation method, examples and listings of computer programs for the axisymmetric and the three dimensional starting plane flowfields about a sphere in the Mach number range from 1.5 to 10 and angle of attack between 0 to 35 degrees are presented. Measurements of cloud particle images and concentrations using laser spectrometers housed in pods mounted on the wings or fuselages of research aircraft can be affected by the distortion of the airflow about the aircraft. The Flight Research Laboratory has developed a pod with a Rosemount 858 5-hole probe and pressure transducers to measure airflow angles and velocities at typical mounting locations on cloud physics research aircraft. This report documents the results of an extensive wind tunnel calibration of this pod to determine the factors relating the differential pressure measurements to the flow angles and velocities, and in particular to account for the effects of the canister itself on these measurements. Wind tunnel results on the separated flow over a delta wing at high subsonic Mach numbers (0.55 to 0.85) were obtained for the validation of computer codes based on the Euler flow quations. The two models tested were of the same planform with flat upper surfaces and sharp leading edges, and cropped delta wings with 65 deg leading edge sweep. The larger model had a fuselage extending in front of the wing apex. It was used to study the flow by means of surface oil flow visualization, Schlieren pictures, and 5 hole directional probe flow field surveys at angles of incidence of 0, 5, 15, and 20 deg. With the smaller model, that had no fuselage, vortex breakdown was studied by Schlieren pictures. This model could reach a maximum angle of incidence of 35 deg. Author (ESA)

**ELEMENTS OF THE AERODYNAMIC THEORY OF CYCLOGYRO WING SYSTEMS WITH CONCENTRATOR EFFECTS**
R. COENE Oct. 1983 91 p refs
(VTH-LR-338) Avail: NTIS HC A05/MF A01

The fluid dynamics of cyclogyro wing systems are analyzed, based on two-dimensional potential flow theory. General expressions for flows associated with circular distributions of bound vorticity are derived. The forces and moments exerted by the flow on the bound vortices are calculated in their relation with the mass flux and the ground effect. The mean flows generated by wings with constant circulation are used as the environment in which energy exchange related to the shedding of vorticity can take place efficiently. Concentrator effects in the propeller and the turbine case are emphasized. For a wing system operating as a turbine with concentrator effects, the Lanchester-Betz limit for the conversion efficiency, 16/17, is invalid and can be increased. Wing systems operating as a propeller can generate thrust more efficiently when concentrator effects occur. Author (ESA)

Jun. 1985 51 p Proceedings of the 59th Meeting of the Structures and Materials Panel, Toulouse, France, 2-7 Sep. 1984
(AGARD-CP-374-ADD-1; ISBN-92-835-1501-3) Avail: NTIS HC A04/MF A01

The 59th meeting of the AGARD Structures and Materials Panel (SMP) was held on 3 to 7 September 1984 in Toulouse, France. It included a specialists' conference to discuss the latest methods of predicting transonic unsteady airloads for oscillating surfaces and flutter. Also considered were aeroelastic applications, many of which were made to standard configurations selected for the SMP cooperative program. The 16 papers and the round table discussion are summarized in some detail for coordination with AGARD's Fluid Dynamics Panel and Fluid Mechanics Panel. Author

**SMALL STONE IMPACT TESTING**
R. L. ANDERSON (Rosemount, Inc., Eden Prairie, MN) IN: Institute of Environmental Sciences, Annual Technical Meeting, 31st, Las Vegas, NV, April 30-May 2, 1985, Proceedings . Mount Prospect, IL, Institute of Environmental Sciences, 1985, p. 380-385.

Evaluation of the Foreign Object Damage (FOD) to an aircraft's fragile data instruments and sensitive external hardware is studied. The FOD testing facility, the Centrifugal Stone Accelerator, consists of a rotating motor-driven swingarm with a stone suspended from a flexible steel cable, and a Hall-effect sensor mounted on the DC shaft and hooked up to an RPM counter. The damage effected by a released 'standard stone' object, made of obsidion and about 0.25 oz weight and 0.6 in diameter, traveling at or in excess of 100 mph is assessed. Results of initial tests are presented. I.S.

**AN OVERVIEW OF CIVIL HELICOPTER OPERATIONS - PAST, PRESENT AND FUTURE**
E. M. BROWN Aerospace (ISSN 0305-0831), vol. 13, Jan. 1986, p. 20, 21, 24-27 .

The designing and developing of helicopters began with the development of the rotary wing. The effect of the turboshaft engine on helicopter designs is examined. The application of information obtained from military helicopters to civilian designs is analyzed. The development of fiberglass blades allowed for improvements in lift, speed, and fuel consumption, and lowered maintenance costs and noise levels. The uses of helicopters for aerial work, such as crop spraying, filming, inspection, transporting cargo, and for offshore support services are described. The focus of the third generation helicopters is on speed, reliability, safety, and comfort; technological advances in these areas are discussed. The design objectives for the fourth generation helicopters are studied. I.F.

**EFFECTS OF MEASUREMENT ERRORS ON ESTIMATION OF THE PROBABILITY OF VERTICAL OVERLAP**
S. NAGAOKA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 378, 1985, p. 403-410. In Japanese, with abstract in English. refs

This paper describes the effects of measurement errors on the distribution of relative vertical distances (RVD) from which the probability of vertical overlap of an aircraft pair can be estimated. As typical examples of probability density functions, the double exponential distribution and the double double exponential distribution are assumed for height keeping errors. Numerical examples suggest that the frequency in the central part (the core region) of RVD distribution in the presence of measurement errors becomes slightly less than that for the case when the measurement errors are not taken into account. On the other hand, the frequency in the tail region becomes slightly greater because of the presence of measurement errors. Author

**1985 - A TURNING POINT FOR SAFETY?**
D. LEARMOUNT Flight International (ISSN 0015-3710), vol. 129, Jan. 25, 1986, p. 27-32.

The need for stricter safety standards in order to reduce aircraft accidents is discussed. A list of fatal and nonfatal aircraft accidents in 1985 is presented; an increase from 451 deaths in 29 accidents in 1984 to 2,129 deaths in 40 accidents in 1985 is observed. Due to a large number of accidents involving engine failure, the efficiency of jet engine designs and inspection procedures is examined. The role of the US FAA and UK Civilian Aviation Authority in improving and enforcing safety standards are described. I.F.

**A FIRST STEP FOR REDUCING HELICOPTER IFR APPROACH MINIMA AGUSTA A109 IFR CAT II CERTIFICATION**
F. BANAL and G. ZANETTI (Costruzioni Aeronautiche Giovanni Agusta S.p.A., Gallarate, Italy) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 15 p.

The advantages and drawbacks of lowering the helicopter IFR weather minima using the current ILS system at airports are reviewed. The certification program to obtain FAA STC for IFR CAT II operations of the Agusta A109A, Mk I helicopter is described. It is shown how the flight evaluation results of that program demonstrate the possibility of changing the present helicopter requirements. C.D.

**A86-26128#**
**AIRWORTHINESS ASPECTS OF FATIGUE IN HELICOPTERS**
J. W. BRISTOW (Civil Aviation Authority, Airworthiness Div., Redhill, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 14 p. refs

Problems in the current practice of component fatigue substantiation for civil helicopters in the U. K., and CAA guidelines to reduce the relatively high number of accidents (in comparison to that of fixed-wing aircraft), are discussed. An analysis of fatigue-related helicopter failures reveals specific problems such as wear, corrosion, and increased loads that are to be targeted for improvements. Steps taken in the direction of the damage tolerance principles set out in a 1984 report are outlined. They include maintaining existing factor levels on fatigue strength, e.g. 1.6 for aluminum and 1.4 for steel. Where damage tolerance has been shown to be impractical, a more rigorous safe-life substantiation is recommended such as the use of SN curves based on realistically tested components and more representative testing of the magnitude of the loads, the stress distribution, and the number of cycles of helicopter flights. Load spectrum and helicopter failure data are included. R.R.

**A86-26151#**
**DETERMINATION OF LIMITATIONS FOR HELICOPTER SHIP-BORNE OPERATIONS**
C. F. G. M. HOFMANN and R. FANG (Nationaal Lucht- en Ruimtevaartlaboratorium, Amsterdam, Netherlands) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 19 p.

The factors influencing helicopter-ship operations are reviewed. The determination of these factors in various qualification program elements and their use in setting up a flight test program aboard ship are examined. The performance of those flight tests and the relevant safety and efficiency constraints are described, and the use during the tests of data obtained in previous program elements in discussed. The application of the test team's previous experience to minimize flying hours without affecting the quality of the test results is examined. C.D.

**GENERAL AVIATION CRASHWORTHINESS PROJECT, PHASE 3: ACCELERATION LOADS AND VELOCITY CHANGES OF SURVIVABLE GENERAL AVIATION ACCIDENTS Safety Report, 1972-1981**
4 Sep. 1985 189 p
(NTSB/SR-85/02) Avail: NTIS HC A09/MF A01

This report is the last in a series of three issued by the National Transportation Safety Board as a result of its General Aviation Crashworthiness Program. Its purpose is to provide information to support changes in crashworthiness design standards for seating and restraint systems in general aviation airplanes. Phase One presents a methodology for documenting impact severity. Phase Two presents specific data on survivable accidents which demonstrate that if all occupants wear shoulder harnesses, fatalities are expected to be reduced by 20 percent. Eighty-eight percent of the seriously injured persons in survivable crashes are expected to experience significantly fewer life-threatening injuries. The Phase Three report provides analytical results of actual crashes. The values of acceleration loads and velocity changes that occupants can sustain in survivable, modern general aviation airplane accidents are defined. This report also discusses specific crashworthiness problems including sea/restraint systems that failed, shoulder harnesses that were not worn, and inadequate or nonexistent seat stroking ability. **THE AIRCRAFT ICING ENVIRONMENT IN WINTERTIME, LOW CEILING CONDITIONS Final Report**
N. B. GUTTMAN, R. K. JECK, M. R. HENDERSON, and M. D. MUELLER 28 Oct. 1985 74 p
(AD-A160578; NRL-MR-5650) Avail: NTIS HC A04/MF A01 CSCL 09B

Radiosonde (Raob) temperature and humidity data were used to deduce the vertical distribution of clouds and aircraft icing conditions near Washington, D.C. when low ceilings (- or 1000 ft)(0/3 km) occurred along with surface temperatures near freezing. Automated predictions of the vertical distribution of icing probability, type, and severity were generated from the Raob data. The technique employs a U.S. Air Force method that has been computerized by one of the authors (RKJ) for use on Hewlett Packard model 9845 computers. The predictions were compared with pilot reports from the vicinity and reasonable agreement was found. GRA

**AN ELECTRONIC INDEX OF ARTICLES PERTAINING TO AIR FORCE TRANSPORTATION IN THE POST-WORLD WAR 2 ERA, WITH ABSTRACTS OF SELECTED ARTICLES M.S. Thesis**

F. R. ANIBLE Sep. 1985 41 p
(AD-A160837; AFIT/GLM/LSM/85S-1) Avail: NTIS HC A03/MF A01 CSCL 15E

This thesis designed and compiled an electronic index system to catalog articles in military, transportation, and aviation periodicals published during the period 1947 through 1957 and pertaining to transportation and its relationship to the U.S. Air Force. The system consists of a Master Index giving the title, author, publication, and date of over 1,000 articles, with abstracts of selected articles. Separate alphabetical Author, Title, and Subject Indexes are cross-referenced to the Master Index through a simple numerical code system. The indexes are stored on 5-1/4 inch flexible magnetic diskettes which are placed in pockets fastened into the front and back covers of the copy of the thesis kept in the Library of the School of Systems and Logistics, Air Force Institute of Technology. The articles indexed are those dealing with transportation modes and vehicles owned, operated, used, contracted, and leased by the Air force operations. In addition, source pertaining to the interface of Air Force airlift operations and operations of other services are included. GRA

**MODE-S BEACON SYSTEM TO COVER ALL U.S. UPPER AIRSPACE BY 1991**

J. L. BAKER (Westinghouse Electric Corp., Pittsburgh, PA), P. N. MCCABE (System Development Corp., Santa Monica, CA), and K. V. BYRAM (FAA, Washington, DC) ICAO Bulletin, vol. 40, Dec. 1985, p. 14-17.

The design of the Mode-S beacon system, which will modernize air traffic control systems by increasing the reporting accuracy of aircraft positions while reducing interference, is studied. The Mode-S system provides monopulse processing, selective interrogation, and a two-way data link. The capabilities of the radio-frequency and pulse processing hardware of the computer controlled interrogator subsystem are examined. The hardware components and functions of the data processing subsystem, which controls real-time scheduling and processing of surveillance and communication data, and communication and surveillance interfacing, are investigated; the subsystem contains transaction processing, monitoring, and data extraction programs. The advantages the Mode-S system provides due to its expandability and flexibility are described. I.F.

**A86-23379**
**SIMPLE TECHNIQUE MOISTUREPROOFS ILS LOCALIZER ANTENNA ARRAY**
S. M. IRULAPPAN and S. C. MAJUMDAR (Civil Aviation Department, New Delhi, India) ICAO Bulletin, vol. 40, Dec. 1985, p. 26-28.

A method of protecting the dipole elements of the localizer antenna array from rain and moisture, in order to maintain the performance level, is examined. The requirements for the ILS localizer course alignment and radiation integrity are discussed. The configuration of the antenna's 12 dipole elements, which are mounted in front of a reflector having an 85 ft aperture, is described. The application and installation of 115 cm x 150 cm polyethylene bags over each dipole are analyzed. I.F.

**AIRCRAFT APPROACH GUIDANCE USING RELATIVE LORAN-C NAVIGATION**
A. L. ELIAS (MIT, Cambridge, MA) Navigation (ISSN 0028-1522), vol. 32, Spring 1985, p. 1-15. refs

Tests performed at, and in behalf of, the State of Vermont led to the first Supplemental Type Certificate for en route use of Loran-C under Instrument Flight Rules. The results of these tests led to a resurgence of interest in the use of Loran-C as a general-purpose national aeronautical radio-navigation system. The main obstacle to the use of Loran-C for final approach to landing guidance is the error due to variations in the propagation speed of the Loran-C signals caused by changes in the terrain's dielectric properties. A 'relative navigation' technique has been proposed for improving the accuracy. The present paper provides the results of two additional studies, taking into account variable signal-to-noise ratio (SNR)/variable acceleration tradeoffs, and small position changes from the reference point. G.R.

**A86-25025**
**INERTIAL NAVIGATION - THE BEGINNINGS OF AN INGENIOUS INVENTION [TRAEGHEITSNAVIGATION - AUS DEN ANFAENGEN EINER GENIALEN ERFINDUNG]**
L. SCHMIEDER DFVLR-Nachrichten (ISSN 0011-4901), Nov. 1985, p. 64-67. In German.

The present paper is concerned with the development of inertial navigation, taking into account the time from its invention by Boykow (1911) to the official admission of an inertial platform for U.S. aircraft in the year 1968. It is pointed out that, according to these dates, the development of inertial navigation, from the first concept to technological maturity, has required a time period of 57 years. Attention is given to the article in which Boykow (1911) first describes the characteristics of his new invention and its advantages for the navigation of an aircraft, a patent application submitted by Boykow's company (1926), problems related to friction in the bearings and an approach for overcoming those problems, new advances made by Boykow as incorporated in a patent application (1935), a picture of the inertial platform according to Boykow's concepts, developments related to the 84-minute pendulum, and advances described in a patent applied for by Draper et al. (1951). G.R.

**CALIBRATION OF AN ON-GROUND AIRCRAFT TRACKING RADAR BY AERIAL PHOTOGRAMMETRY**
K. YAZAWA, T. INAGAKI, T. ONO, and T. OKA Jun. 1985 42 p refs In JAPANESE; ENGLISH summary
(NAL-TR-861; ISSN-0389-4010) Avail: NTIS HC A03/MF A01

An on-ground tracking radar is calibrated for obtaining the accurate position of an aircraft during flight testing. The calibration was performed by aerial photogrammetry for estimating the position and the attitude of an aircraft compared with synchronized data from tracking radar. The accuracy of aerial photogrammetry using a non-metric camera is less than 0.2% of the flight altitude from ground. The accuracy corresponds to an angle of 0.01 degree at 1000m height and 10km distance from the radar. It is comparable to the resolution of the radar. Author

**PROBABILISTIC EVALUATION OF INDIVIDUAL AIRCRAFT TRACKING TECHNIQUES M.S. Thesis**
R. L. WILKINSON Sep. 1985 146 p
(AD-A160146; AFIT/GSM/ENS/85S-32) Avail: NTIS HC A07/MF A01 CSCL 01C

A study was conducted in order to demonstrate a technique for comparing the outputs of various individual aircraft tracking (IAT) systems. There were two objectives: (1) to determine the distribution of structural lives that could be expected based on a single IAT scenario, and (2) to evaluate the feasibility of replacing the current universal IAT safety factor with specific statistical calculations that consider the strengths and weaknesses of each IAT system. The ultimate goal of this thesis was to begin the transition of individual aircraft tracking from a deterministic approach to a stochastic one. A simulation was performed which included twelve aircraft, each flying five different load history variations at three gross weights. Initial structural damage was assumed based on a reset flaw size after nondestructive inspection. Structural lives were normally distributed with a mean of approximately 4700 flight hours. The cracks present at the one-half lifetime depot inspection were lognormally distributed. Using these distributions, the probabilities of structural failure were calculated for several inspection intervals. Repeating this process for other IAT scenarios would allow a direct comparison of various IAT systems. Eventually, such a process could lead to individual system safety factors, rather that the current universal safety factor. GRA

**SIGNAL PROCESSING IN THE AIRBORNE RECEIVER OF THE INTERSCAN MICROWAVE LANDING SYSTEM Abstract Only**
D. L. DILLON Mar. 1985 3 p
Avail: Issuing Activity

The history and evolution of microwave landing system (MLS) is reviewed. The strategy by which the various MLS functions are sequentially transmitted in accordance with a standardized signal-in-space format is described, making possible the interoperability of ground and airborne subsystems of widely differing sophistication. The meaning of MLS error, its causes and the rationale for the accuracy requirements of the MLS are discussed. The overall task to be performed by the airborne MLS subsystem and the MLS receiver are surveyed. The impact on the processing on MLS signals by interfering propagation effects is considered, together with a review of some MLS signal processing methodologies. A preferred technique is identified. The question of the required sampling rate to implement the signal processing digitally is considered, and a pulse centroid-detection algorithm is described. E.A.K.

F. BYRNE, inventor (to NASA) 10 Sep. 1985 5 p Filed 28 Sep. 1982
(NASA-CASE-KSC-11155-1; US-PATENT-4,540,986; US-PATENT-APPL-SN-425201; US-PATENT-CLASS-343-6.8-R)
Avail: US Patent and Trademark Office CSCL 17G

A circuit is disclosed for use in a transponder located in an aircraft or the like for identifying a true side lobe suppression signal being transmitted by a ground located transmitted system. The true side lobe suppression signal includes at least pulses P1 and P2. The circuit causes the transponder to produce reply signal upon the amplitude of the P1 pulse being a predetermined ratio to said P2 pulse. The circuit includes a pair of transistors with a capacitor connected to the output of the second transistor. The pulses P1 and P2 are supplied to the base electrode of the first transistor. Pulse P1 turns on the two transistors and charges the capacitor to a predetermined level so that when the second pulse P2 arrives, it does not turn on a transistor when it is equal to or less than the first pulse P1.

**AUTOMATIC LANDING THROUGH THE TURBULENT PLANETARY BOUNDARY LAYER**

S. ZHU Nov. 1985 305 p refs
(UTIAS-289; ISSN-0082-5255) Avail: NTIS HC A14/MF A01

A statistical approach to automatic landing in turbulent planetary boundary layer is presented which is valuable for use in aircraft design and the analysis of terminal operation safety, also useful in design of autoland systems. The linearized equations of motion for an aircraft following a glide slope and an exponential curved path in the presence of wind shear and turbulence are developed. The effects of gust gradients on the motion were considered. The wind is modeled as a multi-dimensional random process, characterized by the mean wind shear and the turbulence. In the planetary boundary layer the mean wind is adequately described by a power law and by Weibull wind speed distribution. The turbulence is assumed locally isotropic. The modified von Karman model adequately represents correlations along an approach-flare trajectory. The forces and moments are considered to depend linearly on uniform gust and gust gradient components which are obtained by Etkin's four-point method which utilizes the air velocity at 4 points on the aircraft. As a test base, an autopilot of a jet transport for the approach and flare was designed. The Random Choice Direct Search technique was employed to find a set of optimal feedback gains for the auto-flare control system. Author

**HIGH DYNAMIC GPS RECEIVER VALIDATION DEMONSTRATION Final Report**

W. J. HURD, J. I. STATMAN, and V. A. VILNROTTER 31 Oct. 1985 208 p refs
(Contract NAS7-918)
(NASA-CR-176530; JPL-PUB-85-74; NAS 1.26:176530) Avail: NTIS HC A10/MF A01 CSCL 17G

The Validation Demonstration establishes that the high dynamic Global Positioning System (GPS) receiver concept developed at JPL meets the dynamic tracking requirements for range instrumentation of missiles and drones. It was demonstrated that the receiver can track the pseudorange and pseudorange rate of vehicles with acceleration in excess of 100 g and jerk in excess of 100 g/s, dynamics ten times more severe than specified for conventional High Dynamic GPS receivers. These results and analytic extensions to a complete system configuration establish that all range instrumentation requirements can be met. The receiver can be implemented in the 100 cu in volume required by all missiles and drones, and is ideally suited for transdigitizer or translator applications. Author

**SOME THOUGHTS ON THE VIBRATION TESTING OF HELICOPTER EQUIPMENT IN THE UK**

J. C. BARKER (Westland Helicopters, Ltd., Yeovil, England) and H. GOLDBERG (GEC Avionics, Ltd., Borehamwood, England) IN: Institute of Environmental Sciences, Annual Technical Meeting, 31st, Las Vegas, NV, April 30-May 2, 1985, Proceedings . Mount Prospect, IL, Institute of Environmental Sciences, 1985, p. 420-430.

The history of the changes in the design requirements set by the Joint Airworthiness Committee for the United Kingdom military helicopters is reviewed, with reference to the mechanical and environmental sources of vibration. Rotor sources are given special attention, while other mechanical components which can induce vibration (shafts, rotor gear boxes, hydraulic pumps, turboengines, tailplanes, and fins) are briefly discussed. Results of a data survey, undertaken to produce quantitative basis for drafting additional specifications, are presented and compared with the old MIL Standard 810D formulae. Based on these results and on comparison with the U.S. helicopters, standards for the minimum-vibration designs, and a new testing philosophy were drafted. A flow chart of testing procedures, and data survey results are included. I.S.

**INFLUENCE OF NONLINEAR BLADE DAMPING ON HELICOPTER GROUND RESONANCE INSTABILITY**

D. M. TANG and E. H. DOWELL (Duke University, Durham, NC) Journal of Aircraft (ISSN 0021-8669), vol. 23, Feb. 1986, p. 104-110. refs
(Contract NSF MEA-83-15193)

The lagging motion of each helicopter blade is assumed to be of equal amplitude and equally apportioned phase, thus allowing a simplified analytical method to be used to calculate the ground resonance instability of a helicopter model with nonlinear dampers in both the landing gear and blades. The geometrical nonlinearities of the blade lag motion and the influence of initial disturbances on ground resonance instability are also discussed. Finally an experiment is carried out using a helicopter scale model. The experimental data agree well with analysis. Author

**AEROACOUSTICS OF AN ADVANCED PROPELLER DESIGN UNDER TAKEKOFF AND LANDING CONDITIONS**

S. FUJII, H. NISHIWAKI, and K. TAKEDA (National Aerospace Laboratory, Tokyo, Japan) Journal of Aircraft (ISSN 0021-8669), vol. 23, Feb. 1986, p. 136-141. Research supported by the Environment Protection Agency of Japan. refs

Three configurations of six-bladed, 400-mm-diam, scale-model advanced propellers such as backward-, forward-, and back-forward alternately installed swept blades were tested in anechoic environments with an incoming main flow velocity up to 68 m/s. The data for the advance ratio of 0.43-1.15 were obtained in the aeroacoustic aspects. The arrangement of alternately swept blades showed the best quality among the three configurations in the spanwise circulation in the spanwise circulation distribution. The forward-swept blades did not exhibit any aeroacoustic advantage. The alternately swept configuration as a tandem rotation has the potential for decreasing the sound levels at the blade passage frequencies by the dispersion of sound with neither any sacrifice of aerodynamic performance nor mechanical complexity. **SOCIETY OF FLIGHT TEST ENGINEERS, ANNUAL SYMPOSIUM, 15TH, ST. LOUIS, MO, AUGUST 12-16, 1984, PROCEEDINGS**

Lancaster, CA, Society of Flight Test Engineers, 1984, 196 p. For individual items see A86-23253 to A86-23273, A86-23275.

Various papers on flight test technology are presented. The topics addressed include: airborne instrumentation magnetic tape recording through the early 1990s; automated electromagnetic compatibility testing of naval aircraft and integrated avionics; advanced vibration monitoring approach to engine/airframe health and usage monitoring; use of video cassette recorders for combined video and PCM data recording; IFDAPS: hardware and software overview and a user's view; F-16XL flight test overview; infrared instrumentation capabilities at Eglin Air Force Base. Also discussed are: flight test data acquisition and processing system; state of the art computer graphics systems for flight safety monitoring; improved smoke generator for aircraft testing; telemetry system prototype development; intelligent amplifier; inflight resolution evaluation for thermal imaging systems; flight evaluation of a digital electronic engine control; Air Force flight test instrumentation system; and economical in-flight calibration of air data sensors using inertial navigation units as reference. C.D.

**AUTOMATED ELECTROMAGNETIC COMPATIBILITY (EMC) TESTING OF NAVAL AIRCRAFT AND INTEGRATED AVIONICS**

D. E. TETHER (Veda, Inc., Lexington Park, MD) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 2-1 to 2-7.

The Electromagnetic Compatibility (EMC) testing of Naval aircraft and their associated mission systems is chracteristically as complex as the mission systems being tested and consumes most of the EMC engineers time performing repetitive observations. This paper discusses automation of the repetitive sequences of observations contained in Emission Control (EMCON) and Conducted Emission (CONEM) testing of Naval aircraft and their mission systems. The effects of automation on the continuing escalation in cost of EMC testing are addressed. Author

**THE F-16XL FLIGHT TEST PROGRAM**

J. N. BOWER and S. R. SCOTT (USAF, Edwards AFB, CA) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 9-1 to 9-5.

This paper presents an overview of the F-16XL Phase I flight test program recently conducted at the Air Force Flight Test center (AFFTC), Edwards AFB, California. The F-16XL was a straight-forward airframe modification of the existing F-16A designed to enhance range, payload and speed capabilities. By retaining the majority of the already-proven F-16A systems, the technical and flight test risks for the F-16XL were significantly reduced compared to similar prototype development programs. Prior to any program decision, it was necessary to demonstrate that the XL design concept improved the operational characteristics of the F-16A while imposing no adverse effects. This could only be accomplished through an extensive flight test program. Author

**RESULTS OF HIGH ANGLE-OF-ATTACK TESTING OF THE F-15 WITH CONFORMAL FUEL TANKS**

M. D. BASS (McDonnell Aircraft Co., St. Louis, MO) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 16-1 to 16-6.

Results of the high angle-of-attack flight characteristics evaluation of the F-15 equipped with Conformal Fuel Tanks are presented. Testing was accomplished as part of USAF Conformal Fuel Tanks Certification. High angle-of-attack feight characteristics were benign, and similar to the high AOA flight characteristics of the F-15 without Conformal Fuel Tanks. The flight test long noseboom caused adverse high angle-of-attack characteristics. Removal of the noseboom eliminated the adverse characteristics. Future high angle-of-attack test programs should verify the requiement for use of this device. Testing was accomplished without a spin parachute installation on the aicraft, and the cautious approach to testing is documented. Author

**ECONOMICAL IN-FLIGHT CALIBRATION OF AIR DATA SENSORS USING INERTIAL NAVIGATION UNITS AS REFERENCE**

K.-H. BURGER (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 19-1 to 19-10.

An economical method of aircraft sensor calibration, AUTARK, is described. The method makes it possible to obtain reliable estimates of sensor errors using radar altimeter measurements and navigational data. Among the specific aircraft parameters measured by AUTARK are: the angle of attack, sideslip angle, and fuselage bending due to air loads. The method was evaluated during recent calibrations tests on the Tornado combat aircraft. It is found that the AUTARK method reduced the number of flying hours required to calibrate aircraft sensors. I.H.

### THE ROLE OF THE FLIGHT TEST DEPARTMENT IN THE DEVELOPMENT OF NEW TECHNOLOGY AIRCRAFT

A. J. PUGLIESE (Grumman Aerospace Corp., Bethpage, NY) IN: Society of Flight Test Engineers, Annual Symposium, 15th, St. Louis, MO, August 12-16, 1984, Proceedings . Lancaster, CA, Society of Flight Test Engineers, 1984, p. 20-1 to 20-8.

In the present discussion of advanced aerodynamic and structural concepts under development, the relationship of developmental experience to the preparation of highly relevant and through, full scale test program is noted and attention is given to multimode flight control system testing and the development of flight test procedures for the analysis and correcting of system failures in flight. The need for instant and reliable emergency power in relaxed stability fly-by-wire aircraft requires through preflight testing and flight planning. The conclusions presently reached concern the management objectives of future flight test programs, regarding the lead time and preparatory measures required for new aircraft. O.C.

### ENVIRONMENTAL CONTROL SYSTEM SIMULATION USING EASY5, AS APPLIED TO THE F-14

G. L. HOFFMAN (U.S. Navy, Naval Air Development Center, Warminster, PA) AIAA, SAE, ASME, AIChE, and ASMA, Intersociety Conference on Environmental Systems, 15th, San Francisco, CA, July 15-17, 1985. 8 p.
(SAE PAPER 851318)

The Naval Air Development Center has developed a thermal model of the F-14 Environmental Control System (ECS) using the EASY5 dynamic analysis computer program. In addition to discussing the modeling effort, this paper also details several improvements made to the EASY5 program in an attempt to improve its accuracy, flexibility, and computational stability. Also highlighted is a simplified version of the F-14 EASY5 ECS model which is being used to conduct trade studies and to calculate the initial conditions required to run the EASY5 program. Author

### DIGITAL CONTROLLED CLOSED LOOP AIR CYCLE DEVELOPMENT

G. S. TSUJIKAWA (Boeing Military Airplane Co., Seattle, WA) AIAA, SAE, ASME, AIChE, and ASMA, Intersociety Conference on Environmental Systems, 15th, San Francisco, CA, July 15-17, 1985. 12 p.
(SAE PAPER 851319)

The use of a closed loop environmental control system (ECS) in military aircraft incorporating microprocessor control can reduce engine energy extraction requirements, yielding a reduction in aircraft weight penaltites and/or an increase in range. In addition, chemical and biological warfare threats are reduced and a more favorable thermal environment is obtained for electronics. Attention is presently given to the development of an ECS digital control system whose capabilities have been demonstrated in a laboratory breadboard test rig. O.C.

### THE NEW ENVIRONMENTAL CONTROL SYSTEM FOR THE B-52 G/H AIRCRAFT

F. L. BUSCARELLO (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT) AIAA, SAE, ASME, AIChE, and ASMA, Intersociety Conference on Environmental Systems, 15th, San Francisco, CA, July 15-17, 1985. 14 p.
(SAE PAPER 851320)

Environmental Control System (ECS) for the B-52 G/H Aircraft The Boeing B-52 G/H aircraft uses precooled engine bleed air as a source for cabin pressurization and cabin, missile and avionics air conditioning. These systems are controlled by two solid state controllers which also contain built in self test and fault isolation. The ECS regulates the bleed air pressure and flow via an electrical signal from a cooling effect sensor in the avionics air supply. This flow control approach saves engine bleed air by not dumping excessive cold air into the avionics equipment and not overcooling or overheating the two cabins or missiles. The missile conditioning system mixes cold and warm air to keep the missiles at the required temperature. The system also provides a 'go-no-go' signal to the cabin to indicate 'temperature readiness' of the missiles. The two cabins are separately temperature controlled through individual temperature selectors and controls. Author

### LOW COST THERMAL CONTROL FOR FLIGHT TEST LASER RADAR

A. BRUNS (McDonnell Douglas Astronautics Co., St. Louis, Mo) AIAA, SAE, ASME, AIChE, and ASMA, Intersociety Conference on Environmental Systems, 15th, San Francisco, CA, July 15-17, 1985. 11 p.
(SAE PAPER 851321)

As part of an internal program to develop laser radar guidance systems for advanced cruise missiles, a thermal control unit (TCU) was developed for captive flight testing. Requirements of low cost, low maintenance, and small size resulted in the choice of an active, closed-loop, liquid TCU that uses ram air as the heat source or sink. Four coldplates thermally couple the laser to the TCU in the pump-operated liquid cooling reservoir. Four thermoelectric heat pumps mounted on a finned heat sink transfer heat between the liquid loop and the ram air. Temperature sensors downstream of the laser determine the amount of amplifier current driving the thermoelectrics, and whether they should add heat to the coolant or remove it. In flight tests on a King Air aircraft it successfully maintained the laser at + or - 1 C within the operating limits of 27-38 C over all air and ground conditions with a laser heat dissipation load of 200 watts on a 43 C hot day. Performance characteristics of the heating and cooling modes are presented. R.R.

**A86-23545**

### COMPUTER CONTROLLED VARIABLE PRESSURE REDUCING/SHUT-OFF VALVE FOR AIRCRAFT ECS

M. ANDRIANO, V. MARCHIS (Torino, Politecnico, Turin, Italy), and A. MANNINI (Microtecnica-Torino, Turin, Italy) AIAA, SAE, ASME, AIChE, and ASMA, Intersociety Conference on Environmental Systems, 15th, San Francisco, CA, July 15-17, 1985. 9 p.
(SAE PAPER 851360)

The present paper reports the development results of a computer controlled variable setting pressure reducing valve (VPRV) designed by Microtecnica and suitable for operation in the latest generation of aircraft ECS. The valves features a double element design, allowing a total independent operation (Shut-Off section and pressure reducing section) offering thereby high reliability and safety. The valve provides wide capability of varying the pressure set point by action of an electric servo and allows considerable weight and energy saving in the ECS design. Results of Experimental Tests performed in the development program are presented in detail. Author

### A POSSIBLE APPROACH TO THE DIAGNOSTICS OF THE HYDRAULIC SERVOMECHANISM OF THE AIRCRAFT CONTROL SYSTEM [MOZNY PRISTUP K DIAGNOSTIKOVANIU HYDRAULICKEHO SERVOMECHANIZMU RIADENIA LIETADLA]

A. ZIGO Zpravodaj VZLU (ISSN 0044-5355), no. 3, 1985, p. 185-189. In Slovak.

An approach to the analysis of the performance of the hydraulic servomechanism of the aircraft control system is presented. The approach involves a systematic mathematical analysis of the dynamic characteristics of the individual elements of the hydraulic control system and determination of the intermediate values of certain parameters essential for the reliable operation of the system. The results of the analysis are then used, together with flight operation data, to construct a topological model which provides a way to determine an optimum set of diagnostic parameters characterizing the technical condition of the system. V.L.

**LOCATING AND DEMAGNETIZING MAGNETIZED AIRCRAFT COMPONENTS FOLLOWING A LIGHTNING STROKE [LOKALIZACE ZMAGNETOVANYCH CASTI LETADEL PO UDERU BLESKU A JEJICH ODMAGNETOVANI]**

J. HRABAK and K. DRAXLER Zpravodaj VZLU (ISSN 0044-5355), no. 4, 1985, p. 263-265. In Czech.

The physical mechanisms underlying the magnetization of aircraft components affected by a lightning stroke are examined, and methods are presented for locating and demagnetizing such components. A system for locating and demagnetizing lightning-affected parts and components is briefly described. V.L.

**A86-23768**

**METHODS FOR DETERMINING THE WEIGHT AND THE CENTER OF GRAVITY OF AIRCRAFT - THE PLATFORM BALANCE OF THE AERONAUTICAL RESEARCH AND TEST INSTITUTE [ZPUSOBY URCOVANI HMOTNOSTI A POLOHY TEZISTE LETADEL, PLOSINOVE VAHY VZLU]**

J. LUKAS and J. VIDIECAN Zpravodaj VZLU (ISSN 0044-5355), no. 4, 1985, p. 267-273. In Czech. refs

The various methods for determining the weight and the center of gravity of aircraft are reviewed with reference to their relative advantages and shortcomings. The platform balance developed by the Aeronautical Research and Test Institute is then described in detail, with attention given to its mechanical and electrical systems, functions, and methods of electrical signal processing. V.L.

**A86-23769**

**A STUDY OF THE SERVICE LIFE OF FAIL-SAFE AIRFRAME STRUCTURES ON THE BASIS OF ROUTINE INSPECTIONS AND CRACK SIZE ASSESSMENT [SLEDOVANI ZIVOTA DRAKU KONSTRUKCI BEZPECNYCH I PRI PORUSE NA ZAKLADE PROHLIDEK A POSUZOVANI VELIKOSTI TRHLIN V PROVOZU]**

V. KAHANEK Zpravodaj VZLU (ISSN 0044-5355), no. 4, 1985, p. 275-279. In Czech.

Problems associated with the estimation of the service life of the main airframe structure designed for a safe service life or for fail-safe operation are examined, with particular attention given to the differences between the two design philosophies. While in the former case, only the operating conditions of the aircraft are monitored, in the latter case an aircraft can be taken out of service on the basis of the extent of fatigue damage. V.L.

**A86-23799**

**THE A320 WING - DESIGNING FOR COMMERCIAL SUCCESS**

R. F. BACK and J. R. WEDDERSPOON (British Aerospace, Weybridge, England) Aerospace (ISSN 0305-0831), vol. 13, Jan. 1986, p. 12-19.

The development of the wing for the new European aircraft through the collaboration of various European aircraft companies, is examined. The aerodynamic and engineering optimization testing of numerous wing designs to produce a minimum fuel burning aircraft which is easily manufactured, and operational efficient is analyzed. The designing and testing of a high lift system, which included studying leading and trailing edge devices and flap track systems, is described. The high lift system selected for the aircraft is a near full span leading edge over-wing slat with a trailing edge single-slotted flap system across the span, and an underslung beam track system. I.F.

**A86-24731#**

**AEROELASTIC OSCILLATIONS CAUSED BY TRANSITIONAL BOUNDARY LAYERS AND THEIR ATTENUATION**

D. G. MABEY, P. R. ASHILL, and B. L. WELSH (Royal Aircraft Establishment, Aerodynamics Dept., Bedford, England) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 49-56. refs

(AIAA PAPER 86-0736)

Recent wind tunnel tests on model wings show large amplitude aeroelastic oscillations in the first bending mode associated with transitional boundary layers. A possible mechanism is suggested, which explains the oscillations primarily in terms of reduced aerodynamic damping. The validity of the hypothesis is confirmed by further measurements, in which the oscillations were attenuated by the installation of a vibration absorber in the hollow wing-tip body. Aeroelastic oscillations caused by transition have implications for the measurement of forces, buffeting and flutter characteristics in wind tunnels (including cryogenic facilities), and for the operation of laminar-flow aircraft. Author

**HOVER IN-GROUND-EFFECT TESTING OF A FULL-SCALE, TILT-NACELLE V/STOL MODEL**

J. E. ESHLEMAN, M. R. DUDLEY (NASA, Ames Research Center, Moffett Field, CA), and C. J. SCHELL (Grumman Aerospace Corp., Bethpage, NY) IN: Aerodynamic Testing Conference, 14th, West Palm Beach, FL, March 5-7, 1986, Technical Papers . New York, American Institute of Aeronautics and Astronautics, 1986, p. 346-360. refs

(AIAA PAPER 86-0780)

A full-scale, tilt-nacelle V/STOL aircraft model was tested in hover at the National Full Scale Aerodynamics Complex (NFAC), NASA Ames Research Center. The model was powered by two TF-34 turbofan engines. It was tested at several ground heights and control deflections. Test technique and test setup were documented. Limited results show that (1) a small change in control power with ground height was measured, and control power was found to be good over + or - 20 deg of horizontal vane deflection; (2) integrated fuselage undersurface pressures, when compared with the total model loads and measured thrust, defined the effect of the fountain and its related flow field on model forces and moments; and (3) there was no indication of hot gas ingestion during simulated takeoff in calm winds from wheels on deck ground height. Author

**A86-24988**

**ONE MAN AND 3,000 MILLION OPERATIONS A SECOND - PREPARING FOR THE LHX COCKPIT**

M. LAMBERT Interavia (ISSN 0020-5168), vol. 41, Jan. 1986, p. 27-30.

With the use of the Advanced Rotorcraft Technology Integrator (ARTI), an equipment system is being developed for the mid-1990's for the LHX helicopter to enable single pilot operation of all eight of its scout and attack missions. The system must be capable of executing 3,231 million operations/sec covering navigation, communication, electronic defensive measures, displays, interfaces, target recognition and weapon delivery. If it becomes available, Very High-Speed Integrated Circuitry will make possible a system design of relatively low weight (54 kg), volume, and cost. The system necessitates helicopter design changes to simplify handling, such removal of cross coupling between the axes of control, and creating an optimum combination of side-stick and rudder pedal control. A computer-based Cockpit Emergency Directed Action Program could be used to detect and take action on system faults. Information will have to be circulated over multiple electronic and optical data buses. R.R.

**A86-24989**

**THE HELICOPTER AND THE OTHER VTOL DESIGNS - AN INTERAVIA READER'S MANUAL**

N. LAPPOS (United Technologies Corp., Sikorsky Aircraft, Stratford, CT) Interavia (ISSN 0020-5168), vol. 41, Jan. 1986, p. 33-35.

The helicopter's future development and competitiveness with the VTOL are considered. Potential developments in thermodynamic power resulting in the reduction of engine weight will most likely increase safety and maneuverability rather than payload (as already evidenced by the S-70 Black Hawk). The increased use of microelectronics will increase cost efficiency in both design and performance. Advances in rotor technology will have to balance rotor offset and control response with vibration damping. Low-drag helicopters such as the Sikorsky S-76 with cruise speeds of over 180 kn are the model for maximum achievable velocity, while improvements in anti-torque system for tail rotor design will probably achieve sideways speeds of 35 kn. VTOL's such as the tilt-rotor have higher disk loading than the helicopter, and they trade-off higher speed and range against lower hover payload fraction and much larger powerplant weight/power requirements. Other developments including the Sikorsky ABC (using coaxial counter-rotation rotors), and the NASA/Sikorsky X-Wing (with a slotted oval blade-spar cross-section), will not affect the helicopter's projected dominance in payload/trip time/cost for ranges of up to 300 km. R.R.

**A86-24990**

**LAVI - ADVANCED FIGHTER AND INDUSTRIAL SPRINGBOARD**

B. WANSTALL Interavia (ISSN 0020-5168), vol. 41, Jan. 1986, p. 77-79, 82, 83.

The estimated $2,200 million program for the development of Israel's Lavi, the first all-CAD/CAM combat aircraft, and its impact on Israeli industry, is discussed. Design choices were dictated by lowest life-cycle costs and the Israeli Air Force requirements for overall aircraft capability in terms of performance, survivability (requiring low radar, IR and visual signatures, built-in passive and active ECM and decoy missiles backed up by Shafrir air-to-air missiles), and sortie generation rate. Operational requirements determined a wing configuration of all-moving canards and a quadruplex digital fly-by-wire control system with full artificial stability. Systems requirements were flexibility and adaptability to upgrading, and avionics used MIL-STD-175OA computers. Four two-seater and two single-seater prototypes are scheduled for test flighting beginning in mid-1986. The U.S. has contributed significant funding for the project and will benefit by substantial subcontracting. Aircraft specifications are included. R.R.

**A86-25020**

**D-CALM - NEW RESEARCH AIRCRAFT FOR REMOTE SENSING [D-CALM - NEUES FORSCHUNGSFLUGZEUG FUER DIE FERNERKUNDUNG]**

F. SCHATT (DFVLR, Oberpfaffenhofen, West Germany) DFVLR-Nachrichten (ISSN 0011-4901), Nov. 1985, p. 39, 40. In German.

The 'Department Flight Operations' of the DFVLR received the new research aircraft 'D-CALM' on August 20, 1985. The aircraft is to be employed in operations related to remote-sensing studies conducted by the DFVLR. During the period from 1975 to 1977, the DFVLR has participated, for the first time, in an operational earth reconnaissance project. It was found, that future tasks would require the use of a larger aircraft than the one employed in the first project. In the context of this conclusion, the D-CALM was obtained. The reasons for the selection of the particular type of aircraft chosen are discussed along with a number of modifications which were needed in connection with the functions of the D-CALM as research aircraft. Attention is given to the advantages of the turboprop engines of the new aircraft, the suitability of the aircraft for operations related to oceanography and studies involving flights over extended desert areas, the utilization of a 'wing of new technology' the cabin, the navigation system, and the first operation. G.R.

**A86-25024**

**COMPUTER-AIDED 'SOMATOGRAPHY' FOR THE ERGONOMIC DESIGN OF THE ATTAS EXPERIMENTAL COCKPIT [RECHNERGESTUETZTE SOMATOGRAPHIE ZUR ERGONOMISCHEN GESTALTUNG DES ATTAS-EXPERIMENTALCOCKPITS]**

R. UCKERMANN and K. KROHN (DFVLR, Institut fuer Flugfuehrung, Brunswick, West Germany) DFVLR-Nachrichten (ISSN 0011-4901), Nov. 1985, p. 62, 63. In German.

The Advanced Technologies Testing Aircraft System (ATTAS) was obtained by installing suitable equipment on a VFW 614 aircraft, taking into account also appropriate alterations and modifications with respect to the original aircraft structure. ATTAS is to provide a basis for studies of the feasibility of an employment of the most advanced technologies in aircraft. In this context, an experimental cockpit is to be established in ATTAS. In connection with the design of this cockpit, studies involving computer-aided 'somatography' are conducted. According to Jenik and Jenik (1975), 'somatography' is a graphic-constructive method for the representation of schematic pictures of the human figure in significant postures. The objective of the considered approach is the adaptation of the cockpit to the human figure. Attention is given to the functional characteristics of somatography, and the application of these characteristics to the design of the experimental cockpit. G.R.

**ROTORCRAFT TRENDS. II - REQUIREMENTS AND MONITORING**

T. FORD Aircraft Engineering (ISSN 0002-2667), vol. 57, Dec. 1985, p. 6-9, 12.

The use of health monitoring for damage detection in helicopters and to achieve better airworthiness is examined. The importance of visual inspection aids, vibration analysis, and wear debris monitoring in the monitoring process is discussed. The health monitoring requirements for the components of the transmissions, rotor systems, flight control systems, structure, and engines and fuel systems are described. The applications of vibration signal averaging, full flow chip detector, spectrometric oil analysis, ferrographic oil analysis, and introscope inspection to health and usage monitoring of helicopters are investigated, and examples are provded. Author

**COMPARATIVE ANALYSIS OF TWO METHODS FOR EVALUATING THE LOADS ACTING ON THE TAIL PLANE DURING A SYMMETRIC MANOEUVRE**

J. BOJANOWSKI and W. LESNIEWSKI Instytut Lotnictwa, Prace (ISSN 0509-6669), no. 100, 1985, p. 3-31. In Polish. refs

The two methods which are compared are those for evaluating the loads acting on the tail plane during a pitching maneuver. The first method is based on the assumed changes of the load factor as a function of time and the other method is based on the assumed changes of the elevator displacement. An equation of short-duration motion is derived with a minimum number of assumptions. The procedure for obtaining the relations used in both cases is presented as well as formulas for computing the loads acting on the tail plane. This computation is performed for a particular type of aircraft over a wide range of altitude and flying speed. The results are presented in a graphical form. Some inferences are drawn as regards the extremum values of the loads acting on the tail plane as obtained by both methods. Author

**A86-25096#**

**AN ANALYSIS OF THE INFLUENCE OF THE DURATION AND SHARPNESS OF A SYMMETRIC MANOEUVRE ON THE LOAD ACTING ON THE TAIL PLANE**

J. LAMPARSKI and M. GRABIAS Instytut Lotnictwa, Prace (ISSN 0509-6669), no. 100, 1985, p. 33-47. In Polish.

The load acting on the tail plane during a symmetric maneuver is analyzed for various aircraft types on the basis of the familiar equation of the longitudinal motion of an aircraft given in the NACA Report 1007. The influence of the time in which the maximum load is attained and of the sharpness of the maneuver on the forces acting on the tail plane is studied. The analysis is performed for each of the aircraft types considered, their centers of gravity being assumed to be located in the middle position. An additional analysis is made for one of them for three locations of the center of gravity. Some conclusions are drawn concerning the influence of the parameters assumed on the forces acting on the tail plane. Author

**EFFECT OF SWEEP ANGLE ON STATIC AEROELASTICITY - THEORY FOR PHYSICAL MEANINGS**

S. ANDO Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 372, 1985, p. 45-49. In Japanese, with abstract in English. refs

A theory is presented to show simply the essential effect of sweep angle on divergence and aileron reversal. For this purpose, several simplification assumptions are introduced such as high aspect ratio, strip theory of aerodynamics, effective wing root and tip, assumed mode shapes for bending and torsion, etc. Thus, a kind of theory for 'typical section' is developed. The result shows that the divergence speed would be increased and decreased by sweep back and forward, respectively, as is well known. But for aileron reversal, the results seems not to agree with the textbook description. The result obtained here suggests that the reversal speed increases irrespective of sweep back or forward, while the lift due to aileron angle increases and decreases for sweep forward and back, respectively. **ENERGY SAVING IN AIRCRAFT**

H. KIMURA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 374, 1985, p. 138-146. In Japanese.

Current status and historical evolution of energy saving systems in aircraft are reviewed. The factors affecting the fuel mileage of aircraft, a method of energy saving, advantages of the turbofan engine for saving fuel cost, and performance characteristics of the fourth generation jet aircraft (Boeing 767) in energy saving are analyzed. The development of the propfan for reducing the fuel cost is emphasized. The contributing factors in reducing the fuel consumption are listed. S.H.

**A86-25237#**

**FIGURES OF OUT SURFACE OF AN AIRPLANE MODEL**

M. NAKAMURA Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 33, no. 381, 1985, p. 607-612. In Japanese, with abstract in English. refs

Computational figures of airplane surface are made to match an airplane shape in the sense of sight. The airplane surface is described with a large number of quadrangles which are based on section lines of the airplane. In one concrete example, the section lines of an airplane model are measured. This airplane model is composed of a body, a wing, a tail unit, and two jet engine nacelles. Several figures of the airplane model from various points of view are drawn by using the law of perspective. These figures give clear information of the shape of the airplane model. Author

**OPTIMAL LIFTING SURFACES OF WINGS OF COMPLEX CONFIGURATIONS AT SUPERSONIC FLIGHT VELOCITIES [OPTIMAL'NYE NESUSHCHIE POVERKHNOSTI KRYL'EV SLOZHNOI GEOMETRII PRI SVERKHZVUKOVYKH SKOROSTIAKH POLETA]**

E. M. PROKHOROV Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), Nov.-Dec. 1985, p. 154-160. In Russian. refs

The problem of flow past infinitely thin wings, producing only slight perturbations in an ideal gas, is analyzed using a linear formulation. The optimum shape of the wing is determined by finding a function of the local angles of attack which corresponds to a minimum drag coefficient under constraints on the lifting force coefficient and the pitching moment. For a given Mach number, nonseparated flow is realized on an optimal wing, with a zero load on the subsonic leading edge. V.L.

**SUPERSONIC PASSENGER DECADE**

J. M. RAMSDEN Flight International (ISSN 0015-3710), vol. 129, Jan. 25, 1986, p. 20-25.

The components of the French and British Concordes are described. The fly-by-wire controls of the powered flying control unit, and the nozzles, reheat, and thrust-reversers of the Olympus engines are examined. The problems encountered with the undercarriage are analyzed. The monitoring and maintenance of the aircraft to ensure an adequate service life are investigated. The Concorde's fuel-burn curve and noise level are discussed. I.F.

**STRUCTURAL AIRWORTHINESS - A DECADE OF DEVELOPMENTS**

J. W. BRISTOW (Civil Aviation Authority, London, England) (International Federation of Airworthiness, Conference, Amsterdam, Netherlands, Nov. 1985) Tech Air (ISSN 0040-0831), vol. 44, Feb. 1986, p. 1-9. refs

The development of airworthiness standards which will maintain the structural integrity of aircraft and helicopters is discussed. The fail safe and structural integrity audit procedures for monitoring aging aircraft are examined. The use of SN curves and load spectra for fatigue/damage tolerance requirements for helicopter designs is analyzed. The present methods of testing composites and the establishment of working rquirements for the structural design and processing of composite materials are investigated. I.F.

**IMPROVEMENT OF TWO BLADE SECTIONS FOR HELICOPTER ROTORS**

K. H. HORSTMANN, H. KOESTER (DFVLR, Brunswick, West Germany), and G. POLZ (Messerschmitt-Boelkow-Blohm GmbH, Munich, West Germany) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 14 p. refs

Attention is given to recently developed advanced airfoils for helicopter rotor blades which have been subjected to theoretical and experimental investigations with a view to performance refinement. Near-root airfoil lift coefficients at low Mach numbers and tip airfoil drag rise numbers have both been increased in this fashion. Performance comparisons are made between the present, improved airfoils and their original form, as well as with the classic NACA 23012 profile. O.C.

**AN EXPERIMENTAL INVESTIGATION OF THE INFLUENCE OF A RANGE OF AEROFOIL DESIGN FEATURES ON DYNAMIC STALL ONSET**

P. G. WILBY (Royal Aircraft Establishment, Farnborough, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 17 p. refs

Data from oscillatory pitch tests are used to evaluate the maximum value of incidence that can be attained without incurring stall during the cycle. It is deduced that, for the 12-percent thick airfoils, when stall is first encountered (as mean incidence is increased), stall is triggered by a rear separation. Data from tests at constant pitch rate are then examined, and it is seen that, at low pitch rates, stall is triggered by a rear separation for the thicker airfoils. However, the rear separation is progressively suppressed as pitch rate increases, allowing a greater incidence to be attained before stall occurs, until eventually leading edge separation provides the trigger. For an 8 percent thick airfoil, stall is triggered by a leading edge separation under all conditions. Author

**APPLICATIONS OF AN ANALYSIS OF AXISYMMETRIC BODY EFFECTS ON ROTOR PERFORMANCE AND LOADS**

W. JOHNSON and G. K. YAMAUCHI (NASA, Ames Research Center, Moffett Field, CA) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 23 p. refs

A computationally efficient body analysis is developed and coupled with a comprehensive helicopter analysis to calculate the body-induced aerodynamic effects on rotor performance and loads. A modified slender body theory is used as the body model. With the objective of demonstrating the accuracy, efficiency, and application of the method, the analysis at this stage is restricted to axisymmetric bodies at zero angle of attack. By comparing with results from an exact analysis for simple body shapes, it is found that the modified slender body theory provides an accurate potential flow solution for moderately thick bodies, with only a 10-20 percent increase in computational effort over that of an isolated rotor analysis. The computational ease of this method provides a means for routine assessment of body-induced effects on a rotor. Results are given for several configurations that typify those being used in the NASA Ames 40 x 80-ft Wind Tunnel and in the rotor-body interference tests being conducted at NASA Ames. Author

**A THEORETICAL ANALYSIS OF THE EFFECT OF THRUST-RELATED TURBULENCE DISTORTION ON HELICOPTER ROTOR LOW-FREQUENCY BROADBAND NOISE**

M. WILLIAMS and W. L. HARRIS (MIT, Cambridge, MA) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 14 p. refs
(Contract NSG-1583)

The purpose of the analysis is to determine if inflow turbulence distortion may be a cause of experimentally observed changes in sound pressure levels when the rotor mean loading is varied. The effect of helicopter rotor mean aerodynamics on inflow turbulence is studied within the framework of the turbulence rapid distortion theory developed by Pearson (1959) and Deissler (1961). The distorted inflow turbulence is related to the resultant noise by conventional broadband noise theory. A comparison of the distortion model with experimental data shows that the theoretical model is unable to totally explain observed increases in model rotor sound pressures with increased rotor mean thrust. Comparison of full scale rotor data with the theoretical model shows that a shear-type distortion may explain decreasing sound pressure levels with increasing thrust. Author

**PREDICTION OF AUDITORY MASKING IN HELICOPTER NOISE**

G. M. ROOD (Royal Aircraft Establishment, Human Engineering Div., Farnborough, England) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 17 p. refs

A research program was initiated with the objective to predict to a degree of accuracy the masked thresholds of listeners under high noise conditions. Existing models were extended and modified to cover aspects of military operations both in helicopters and fixed wing aircraft. The present paper provides a description of research regarding the application of the auditory model, giving attention to the conclusions of the research with respect to real-life helicopter noise and operational conditions. A basic auditory filter model was used in the determination of the masked auditory threshold from experiments carried out in the helicopter noise simulator. The basis of the conducted experiment was to measure the auditory threshold of a number of subjects to a range of pure tone frequencies whilst exposing the subjects in the helicopter noise simulator to 'real-life' noise conditions. **DESIGN OF THE 225-KNOT CONVENTIONAL ROTOR**

F. J. MCHUGH (Boeing Vertol Co., Philadelphia, PA) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 25 p. refs

A study on the baseline definition of the advanced flight research rotor (AFRR) of 225 km maximum efficiency cruise speed, and a few details on sensitivity study results and the preliminary design, are presented. The study ground rules were for a four-blade rotor with drag loading of 1500 lb/sq ft, an advancing-tip Mach number limit of 0.9, disk loading of 6.25 lb/sq ft, and Mangler 1 loading. The airfoils were operated at maximum lift to drag. Recommendations include: thrust weighting to define the blade chord; a blade planform with an inverse taper to 88 percent and conventional taper to the tip to provide the maximum rotor lift to equivalent drag (L/DE); and inboard blade stiffness out to 60 percent to reduce the twist requirement. Furthermore, the elastic twist is basically first and second harmonic with a very small amount of third harmonic, and it is mandatory to match the optimum pitch on the advancing side of the rotor to maximize performance. The recommended blade with a L/De of 9.1 shows a 60 percent improvement from the CH-46E reference rotor, and its development has been determined to be feasible. R.R.

**ROTORCRAFT STRUCTURAL DYNAMIC DESIGN MODIFICATIONS**

S. V. HANAGUD, M. MEYYAPPA, Y. P. CHENG, and J. I. CRAIG (Georgia Institute of Technology, Atlanta) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 14 p. refs
(Contract DAAC29-82-K-0094)

At present, most of the structural dynamic design modifications are being done primarily by the use of analytical finite element modelling techniques. Design verifications and testing are accomplished by tests on the full scale rotorcraft with and without modifications. This limits the options for such design modifications. The responsibility primarily lies on the analytical modelling capability. In this paper, a different approach that complements the analytical modelling has been suggested. This approach is by the use of structural dynamic physical scale models, optimization techniques with frequency constraints and general structural dynamic system identification techniques. Author

**INVESTIGATION ON A SMALL SCALE MODEL OF DUCTED COMPOSITE COUNTERROTATING ROTOR**

D. DINI (Pisa, Universita, Italy) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 10 p.

A design feature and prospective performance study is conducted for a novel helicopter configuration in which counterrotating, high solidity rotors are located fore and aft above the fuselage within small diameter ducts. Experimental data obtained with small scale models indicate sufficient dynamic stability in forward flight and maneuvering, on the basis of separate use of the rotors and auxiliary jet power. Increased aerodynamic drag due to the rotor duct limits forward speed, however, so that variable geometry stator vanes under the rotors are required for the generation of lifting flow. O.C.

**APPLICATIONS OF NUMERICAL OPTIMIZATION METHODS TO HELICOPTER DESIGN PROBLEMS - A SURVEY**

H. MIURA (NASA, Ames Research Center, Moffett Field, CA) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 22 p. Previously announced in STAR as N85-10036. refs

A survey of applications of mathematical programming methods is used to improve the design of helicopters and their components. Applications of multivariable search techniques in the finite dimensional space are considered. Five categories of helicopter design problems are considered: (1) conceptual and preliminary design, (2) rotor-system design, (3) airframe structures design, (4) control system design, and (5) flight trajectory planning. Key technical progress in numerical optimization methods relevant to rotorcraft applications are summarized. M.A.C.

**OPTIMUM HELICOPTER IN THE FLIGHT SPECTRUM**

A. RUSSO, G. BONAITA, M. CRESPI, and S. PANCOTTI (Costruzioni Aeronautiche Giovanni Agusta S.p.A., Gallarate, Italy) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 22 p. refs

Attention is given to an optimization technique for helicopter design that encompasses all fundamental parameters of the vehicle; the energy function used allows an averaging of design features, among different anticipated flight conditions for the given performance spectrum or mission profile, with the desired level of importance. For multimission or multi-flight spectrum cases, there exist many optimization strategies based on a pseudoenergy function. Attention is presently given to redundancies among the elements to be optimized, and to elements that significantly reduce total energy. Design differences between conventionally defined and optimized helicopters are noted. O.C.

**A86-26124#**

**THE PROJECT FOR ANTI-TANK HELICOPTER**

G. BOLOGNA and A. GIOVANNINI (Agusta S.p.A., Milan, Italy) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 25 p.

The performance, low detectability, high survivability and weapons platform effectiveness criteria that were used in the design optimization of the dedicated antitank A-129 helicopter are discussed, in the context of the most probable NATO battle scenarios. The design of a multirole helicopter that could be adapted for antitank use by means of a kit was rejected in favor of an antitank weapons platform; iterative tradeoff studies resulted in an exceptionally small and light aircraft extensively using primary structure composites. The effects of missile and small arms threats to such a helicopter are discussed from the viewpoints of powerplant, transmission, rotor, flight control system, and other vulnerabilities. Armor and crashworthiness design considerations are also noted. O.C.

**IMPACT OF ADVANCED TECHNOLOGY ON FUTURE HELICOPTER PRELIMINARY DESIGN**

J. P. ROGERS, R. A. SHINN, and R. L. SMITH (U.S. Army, Directorate for Advanced Systems, St. Louis, MO) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 16 p.

The impact of advanced technology on size and weight of future helicopters was investigated by conducting preliminary design studies for a conventional helicopter configuration designed with 1970's technology, and again with predicted near-term advanced technology levels. The advanced technologies considered in the study include composite structures, advanced engines, digital/optical flight controls, advanced weaponry, and advanced rotor technology. The predicted effect of these advanced technologies on future helicopter rotor performance, airframe weight, installed power, and subsystems weight is presented, as are trends of engine and vehicle sizing with drag reductions. Finally, the integrated effect of across-the-board application of advanced technology on future helicopter preliminary design sizing is presented. The results demonstrate the significant reductions in airframe and engine size and weight that advanced technology will provide for future rotorcraft concepts. Author

**FEASIBILITY OF SIMPLIFYING COUPLED LAG-FLAP-TORSIONAL MODELS FOR ROTOR BLADE STABILITY IN FORWARD FLIGHT**

G. R. NILAKANTAN (Hindustan Aeronautics, Ltd., Bangalore, India) and G. H. GAONKAR (Indian Institute of Science, Bangalore, India) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 32 p. refs

Feasibility of simplifying coupled lag-flap-torsional models is explored for the low-frequency stability of isolated hingeless rotor blades in forward flight. The non-linear equations of moderate deflections with appropriate geometric nonlinearities are valid to third order, so are the perturbed linear equations about time dependent equilibrium (trim) positions. Aerodynamic strip theory based on a quasisteady approximation of two-dimensional unsteady airfoil theory is used. Under linear and quasilinear propulsive trim conditions, stability is investigated for four cases: a base-line model with elastic lag bending, flap bending and torsion degrees of freedom, the modified elastic lag-flap model that neglects only torsional dynamic effects, and the rigid blade models with and without quasisteady approximation to torsion. The method of equivalent Lock number and drag coefficient is used for qualitative insights into dynamic inflow effects. The range of validity of the modified elastic lag-flap and rigid lag-flap models is outlined with respect to torsional frequencies for soft (including matched stiffness) and stiff inplane rotors. Author

**A NONLINEAR MODEL OF AEROELASTIC BEHAVIOUR OF ROTOR BLADES IN FORWARD FLIGHT**

A. ROSEN and O. RAND (Technion - Israel Institute of Technology, Haifa) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 20 p. refs

The paper presents a nonlinear model of the aeroelastic behavior of rotor blades. This model is based on two submodels. The first one is a nonlinear structural/dynamic model while the second is a prescribed-wake unsteady aerodynamic model. The paper concentrates on the method of combining these two submodels. Since these submodels are nonlinear and the steady state is of nonlinear periodic nature, there are certain difficulties in obtaining the final complete aeroelastic response. The paper presents the iterative interactive approach which has been developed and discusses the different problems associated with this model. Two examples are presented where the theoretical results are compared with existing experimental results. It is shown that good agreement is obtained in most of the cases. Author

**AEROMECHANICAL STABILITY ANALYSIS OF A MULTIROTOR VEHICLE WITH APPLICATION TO HYBRID HEAVY LIFT HELICOPTER DYNAMICS**

C. VENKATESAN and P. P. FRIEDMANN (California, University, Los Angeles) Netherlands Association of Aeronautical Engineers and Technische Hogeschool te Delft, European Rotorcraft Forum, 10th, The Hague, Netherlands, Aug. 28-31, 1984, Paper. 27 p. refs

(Contract NAG2-116)

The Hybrid Heavy Lift Helicopter (HHLH) is a potential candidate vehicle aimed at providing heavy lift capability at low cost. This vehicle consists of a buoyant envelope attached to a supporting structure. Four rotor systems are also attached to the supporting structure. Nonlinear equations of motion capable of modeling the dynamics of this multi-rotor/support frame/vehicle system have been developed and used to study the fundamental aeromechanical stability characteristics of this class of vehicles. The mechanism of coupling between the blades, supporting structure and rigid body modes is identified and the effect of buoyancy ratio (buoyant lift/total weight) on the vehicle dynamics is studied. It is shown that dynamics effects have a major role in the design of such vehicles. The analytical model developed is also useful for studying the aeromechanical stability of single rotor and tandem rotor coupled rotor/fuselage systems. Author
